THERE still seems to be considerable doubt about the legality or otherwise of what may be termed swivelling head lights. These head lights are not swivelling in the ordinary acceptance of the term, but are so fitted into their brackets that they are capable of vertical adjustment, which is a great advantage, as a lamp which, as a rule, throws its beams horizontally may on a foggy night be set to throw them downwards, thus illuminating the road instead of the fog. Motor cyclists who do much riding at night need not be told that this makes progress much easier and safer. Some little time ago a more than usually enlightened magistrate gave it as his opinion that such a lamp did not contravene the regulations of the Defence of the Realm Act, but in spite of this devices for removing the adjustment continued to be put forward, and motor cyclists are still in danger of prosecution for carrying such lamps. On the 20th ult. a motor cyclist was stopped in the neighbourhood of Fenny Stratford by four police officers and his lamp confiscated that it might be destroyed (this was reported in a recent issue), although the lamp was not in a condition to be lighted, having no rubber connection between the lamp and generator. This strikes us as a very high-handed piece of interference. The absurdity of making the regulation apply to motor cycles will be realised when we state that a peg or a little solder between the faces of the clamp is sufficient to satisfy the authorities. If a motor cyclist desired to do any signalling with his lamp it would be the work of a moment only to remove the whole complete with generator from the machine, and the lamp adjustments would then make no difference whatever; or simply a loosening of the nuts which attach the bracket to the handle-bar would give sufficient movement.

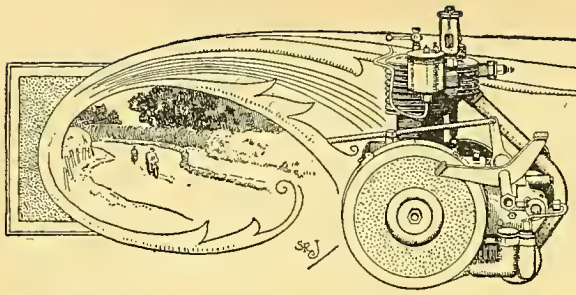
If there is any real need to make these restrictions respecting motor cycle lamps, we contend that they should be made by some responsible central authority, and the conclusions arrived at should be communicated to all parts of the country, so that a motor cyclist could take his lamp to the nearest police station and get definite information as to its suitability or otherwise. If the lamp were passed by the superintendent, he would then know that he was conforming to the law and could go his ways in peace. At present a man can be fined and fined heavily in one district for what is certified as correct in another.

The Psychic Relation Between Man and Machine.

WE publish on another page an interesting letter on the relationship which is possible between a sympathetic rider and his motor cycle. Before we can demonstrate the existence of any psychic connection between the two we must prove that a motor cycle has a soul. The seat of this soul we should take to be the engine, and there is no doubt that the sympathy which a skilful rider has for his engine contributes in a very large degree to his success in getting the utmost out of it, just as a practical driver can obtain better results from a horse than one who is lacking in the necessary temperament and experience.

This is a question, of course, in which it is far easier to theorise than to produce conclusive proof, and in this matter it is by no means alone. Some people refuse to credit anything they cannot understand, and a greater mistake than this it is hardly possible to imagine, for some of our friends would then have extremely limited opportunities for belief; for example, we all know that electricity exists, some of us know a few of its capabilities, but who knows what it really is? A more intelligent interest in our machines, combined with an intelligent anticipation of events, would bring us more efficient service and longer wear from our bits of cast iron, steel, and aluminium.

An index to the advertisements in this issue will be found on the page facing the back cover.



HINTS FOR BEGINNERS.

Some Elementary Tips on the Driving of a Motor Cycle.

NOW that all (?) our young and expert riders are serving their country in various capacities at the Front, and the ranks of enthusiastic clubmen are sadly depleted, it has become increasingly difficult for the novice to obtain reliable advice on the care and management of his machine. There are, too, hundreds of riders on the road who are past the prime of youth, and, therefore, less inclined to risk their necks or their machines in making the experiments in which younger men delight. Many of these are members of no club, and possibly have but few friends who also ride motor cycles, and these machines may be of very different patterns, and consequently the experience of their riders of but little use; thus they are bound to rely entirely upon their own initiative and mechanical ability (in many men a negligible quantity) in every little problem which may crop up. It is for riders of this class that these few notes are penned. So much by way of preface.

Overheating.

Let us first consider the question of overheating. Every rider knows that an engine gets hot, but a letter in *The Motor Cycle* of June 3rd shows that there is much uncertainty in the minds of some as to what constitutes overheating, and the margins mentioned are extremely wide. The rider who always stops to cool his engine when he cannot bear his hand on the cylinder where it joins the crank case is certainly erring on the safe side, but his progress is likely to be slow. On the other hand, if a rider told us that he could see his exhaust valve glowing red-hot while riding we should not call him a liar, whatever we might think (and say when we got home), but should put on our "spring poet" expression and say, "How interesting," or something equally fatuous. After all, the power of believing impossible things is, as Lewis Carroll says, simply a matter of practice. Perhaps, too, he really thought he saw a red-hot exhaust valve; some people think they see snakes. Personally, we should say that an engine is too hot when it begins to lose power; so long as full power is maintained heat does no damage, but when an engine begins to flag more oil should be given at once and less throttle. A test of overheating sometimes adopted is to place a lucifer match on the cylinder head; if this does not ignite it may be taken for granted that the engine is not unduly hot. In the event of a piston seizing paraffin put into the cylinder will prove beneficial.

The causes of overheating are many: overloading, an incorrect mixture, a retarded spark, and insufficient or unsuitable oil are perhaps the most common. Therefore give plenty of oil, for it is better to err on the safe side, and do not drive too hard. A thousand miles at top speed will take more out of the machine and tyres than many thousands at a reasonable pace.

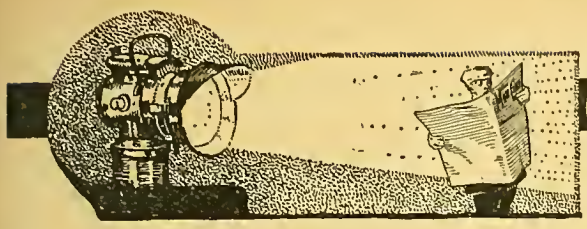
Carburation.

The rider should always aim at getting as perfect a mixture as possible. If his carburetter is an automatic one this will be done for him to a large extent by the designer, but most automatic carburetters have an air adjustment which can be varied to suit atmospheric conditions. This should be done as carefully as possible, the rider noting the position in which the explosions seem to be most powerful. It is not a bad plan to open the air until the engine begins to slow up and misfire occasionally, and then to close it slightly. It should at all times be the rider's object to use as much air as possible, as this economises the petrol and also tends to a cooler running engine.

By "perfect mixture" is meant that proportion of air and petrol which allows the petrol to be completely burnt, but with no excess of air. This mixture gives the hottest flame and quickest combustion, but does not cause overheating to anything like so large an extent as a mixture containing an excess of petrol or even an excess of air, the reason being that the explosion is quicker and more powerful. It will be readily understood that a skewer, for instance, passed quickly through an intensely hot flame will not be heated to the same extent as one passed slowly through a moderate flame; also, when the explosion is comparatively slow, the exhaust valve is opened while the combustion is still incomplete, and this is continued in the exhaust port and pipe, with the result that these become red-hot. Hence the reason of the apparent paradox. A retarded spark will also have a similar effect, and for that reason the ignition should always be kept as far advanced as the speed of the machine will allow. The user of a two-lever carburetter soon gets into the way of adjusting his air to suit his speed and throttle opening, and with some carburetters this adjustment has to be varied constantly with the changes of pace and gradient, but in the case of many of the popular carburetters of the semi-automatic type the air lever is thrown right open when a start has been made and left in that position for all ordinary speeds, the reason being that the throttle is so constructed that it controls both air and gas simultaneously—in fact, it forms a variable choke opening with the throttle, but unless the jet is enlarged as the throttle opens, or other jet orifices uncovered, this gives too much air when the throttle is wide open, and the air lever must be closed down to some extent or the mixture will be too weak. This applies particularly to the two-lever Amac.

Some carburetters are very sensitive to correct petrol level; in others (notably the Senspray) this is of much less importance, owing to the principle upon which they act.

(To be continued.)



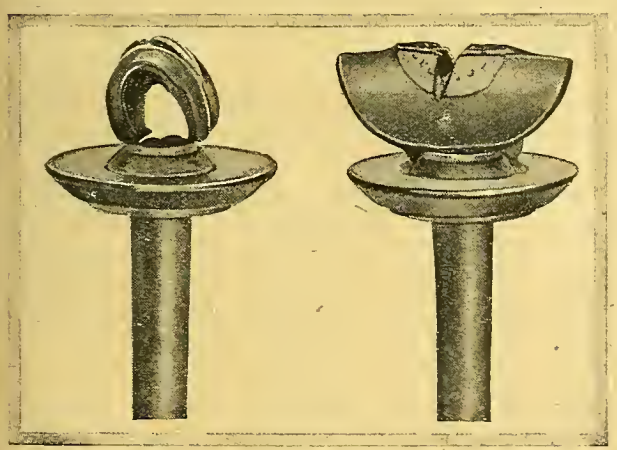
Occasional Comments

"By Ixion"

Now for Tail Lamps.

As our correspondence columns have contained no complaints on the subject, I suppose that most users are tolerably satisfied with the new inventions. I have tried three—all electric, and on the garage shelf there is a fourth waiting for the day when I am driven to return to acetylene for the moment. That acetylene tail lamp is a substantial object, which cost me 7s. 6d., and which certainly will not dissolve even under the terrific vibration which concentrates at the tail of the carrier above a rigid rear frame; my sole dread about using it lies in the fear of catching my costly oilies on it and ripping them from the shirt to the hem, for—shameful to relate—in these days of kick-starters, I still cling to the pre-historic hop, skip, and a jump mount. The "electrocities" as the office wag calls them, have not done badly. One of them—an F.R.S.—cost me 12s. 6d., and would stand up on a 1900 7 h.p. Panhard with solid tyres, as it ought to at that price. Another shed its spring ring and ruby glass on its first trip, and has since shimmered feebly through an ill-tied knot of pink muslin, at which the police blink doubtfully. The third is presumably one of those contraptions alluded to by the gentlemen who know what kilowatts are, as a "choking coil," for it takes its current off the magneto and is guaranteed to burn brilliantly without affecting the ignition. The only time I tried it, nothing would induce the engine to start, and I was coward enough to solve the problem by calling up my reserves and taking out the spare machine adorned by an F.R.S. dynamo; as soon as I can get a spare bulb I shall try it again.

FATE OF A THREE-PIECE VALVE.



A few years ago the three-piece valve was popular on motor cycles, but single-piece valves have now taken their place. The illustrations show how the top portion of a three-piece valve separated from the remainder after continuous use on a 1912 Triumph, the U-shaped top being found resting on the top of the piston, where it had set up a knocking like a hammer on an anvil.

The Evening Promenade.

A year or two ago I called the attention of motor cycling tailors to the fact that nine motor cyclists out of ten, after a speedy day in the saddle, like to stroll round their sleeping town, and to turn their radiant smiles on the damosels of the vicinity; a practice as natural as it is doubtless reprehensible. If they wear their dusty overalls, Phyllis is not kind; if they emerge in their house clothes, they catch cold when they lean against a gate in some rural lane, and whisper sweet nothings into Phyllis's rosy ear. The only solution I then attained was a patent coat, about which the worst thing was its name, the "Legstenshun," or words to that effect. It was a good coat, and I still have it; it is more than a coat, for it has disappearing leggings buttoned inside its skirt; it has served me well, but the Phyllises of my touring routes have never seen it, for it is designed to be worn in the saddle, and the dust from it ruined the chiffons of the first Phyllis who came under its proximity. (We live and learn.) But the other week I found something better suited to the reprehensible brigade. I was smiting the nimble gutty in company with a well-known trade magnate, when a terrific cloud burst caught us just as he was playing his third in a bunker. What time I was burrowing for shelter in a gorse bush, and shouting to my cowering caddie to fetch my oilies from the clubhouse garage, his caddie produced a small satchel measuring about 10in. × 4in. from his golf bag, and shook out of it a featherweight waterproof of smart cut, scaling a couple of pounds or so; and, oddly enough, it turned out to hail from the very firm which makes my oilies, to wit, Barbour, of South Shields. A similar vanity bag now graces the top of my carrier on all long runs, and after a gruelling day in the saddle I turn on to the local boulevards as smart as if I had stepped out of a band box; and I catch no more of those awful "gate-colds."

What the Baby Wants.

Most users of "baby" two-strokes will have noticed that these handy little machines are sluggish starters. I do not mean that there is any difficulty in securing a few initial explosions, but rather that these explosions are of an unsatisfactory character. Whereas a 500 c.c. four-stroke in moderate tune will fire at once, and fire with sufficient vim to justify the driver's vaulting aboard or letting in his clutch without delay, the "baby" will spit and cough and four-stroke for a distance varying from twenty to a hundred yards with the make of the machine or the inclination of the road. When I unleash my "babies" they have to negotiate a slightly uphill run of eighty yards or so before they attain a dead level, and not once in ten starts do they achieve two-stroking until they have climbed this paltry little slope. In a start from cold on the level they are nearly as bad. The

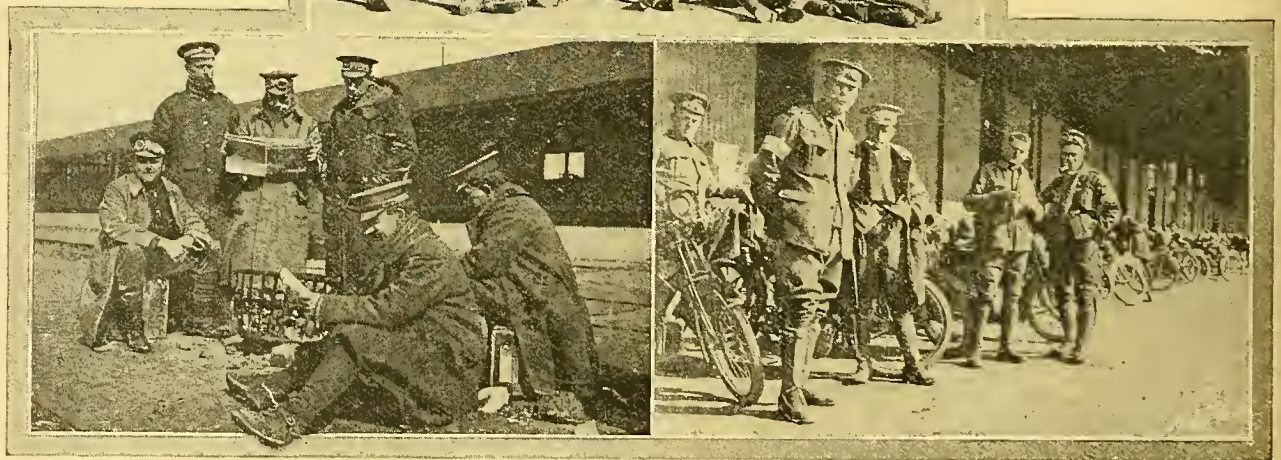
Occasional Comments.—

cause of their misconduct is obvious—or so I fancy. The cylinder, inlet pipe, transfer passage, and crank case are full of cold air; and below these volumes of air there is, more often than not, a pool of cold oil. In addition the chilly spirit in the carburetter vaporises rather sluggishly, and the metal of the engine is all stone cold. I can only get the eighty yards of four-stroking by dint of liberally flooding the carburetter, and the effects of the flooding are exhausted after four or five explosions, when, to all appearance, there are still remnants of cold air in the induction system, the engine metal is still chilled, and the petrol is uncertain about vaporising. It is clear that all these defects could be overcome by a special design of carburetter which afforded a temporary surplus of petrol; such surplus would not be required when running slowly with the same throttle opening and a warm engine. The emergency is purely and simply confined to starting from cold, and applies only to small engines, as a 500 c.c. engine in a coquettish mood can still supply sufficient power. It is plainly for this reason that the Scott manual always advises petrol injections for a start from cold, and in this case the engine is given a chance to warm up by reason of the fact that it is designed to be started when free of its load. Is some refined designer going to cope with the petty worry, or are we to be left to run alongside or foot-slog, world without end? For the time being, I adopt one of two home-made dodges; either I warm the engine up on the stand by pulling over the back wheel, or I keep a finger on the carburetter tickler until the engine begins to two-stroke, as apparently a very rich mixture is required for starting. Over a dozen machines of the best make misbehave in identically the same way under the conditions indicated.

A Deceptive Misfire.

Before my last air-piston control-wire snapped, I allowed myself to be thoroughly deluded. The untinned wire was kinking outside the sheathing, instead of sliding into the sheathing when the lever was moved, and the resultant symptoms were curious, in that the exhaust suggested that one cylinder was firing properly and that the other was suffering from intermittent misfiring. It was dark at the time, and I could not see what was happening. I stopped under a lamp post and squinted over the machine without spotting anything, so I ran the engine, declutched, and shortened each plug in turn with a screwdriver, only to discover that each cylinder fired perfectly solo, but that, when both were running, one always missed. This suggested carburetter trouble, and the cause was then rapidly tracked; but I do not think I have ever struck an exactly parallel case before. Truly, motor cycles are whimsical things, but let us cheer up. A light carist of my acquaintance was seen stopped in a busy street the other day and using particularly strong language. In reply to my enquiry, he remarked there was nothing particular the matter; it was only that his reverse gear insisted on engaging instead of the forward gears, and that while half the car was trying to go forward and the other half was equally eager to travel astern, he could not make good progress. Luckily, motor cycles have not reverse gears. Still the Yankees are providing us with a fresh hoodoo. One of my friends has just got an American machine with an electrical lighting outfit. The head lamp has a big bulb for speed work and a wee bulb for traffic; the other night his big bulb suddenly exploded, and he had to cover seventy miles in inky darkness on a 7-9 h.p. twin with a light about equal to a smouldering safety match. Moral: carry a spare bulb.

DESPATCH RIDERS EN ROUTE TO THE FRONT.



These photographs were taken in France, when a party of forty R.E. despatch riders were on their way to active service. The left-hand picture shows men enjoying a fire and rest at a railway station in the early hours of the morning. Though summer time, warm coats are appreciated at night and early morning

The Mechanical Testing of Metals

AND THEIR INTERNAL STRUCTURE.

By ARTHUR MARKS, F.I.C., A.R.C.S., A.R.S.M. FIRST INSTALMENT.

THE fracture of apparently strong metals whilst in daily use has led to a closer study of the tests to be applied to them, so that an exact impression may be obtained of the way in which the metals will act under the severe conditions which modern usage imposes upon them.

The advent of high speed movers has revolutionised the tests to which metals are now put, since it has been found that the tensile test, which at one time was considered to give a thorough indication of the strength of a metal, has passed metal as good that in practice gave lamentably poor results. It was therefore evident that the tensile test did not completely indicate the way in which the metal would act in practice.

The efforts of metallurgists have, therefore, been directed to the investigation of methods which will test the various properties of a metal independently of each other, and further to obtain some knowledge

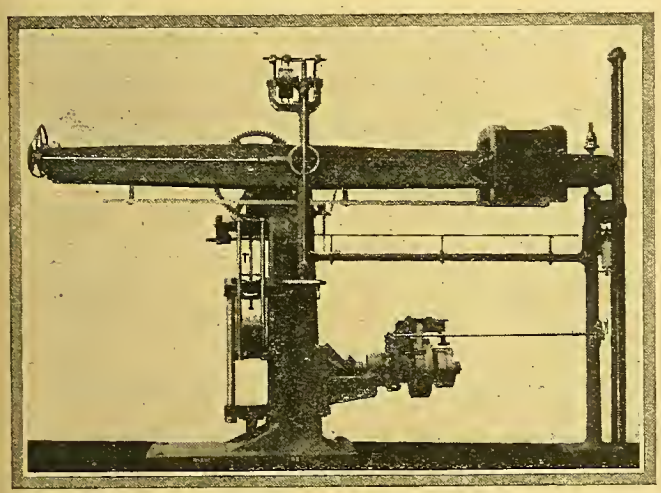


Fig. 1.—Tensile testing machine.

of the relation which each property (*e.g.*, hardness, ductility, malleability) bears to the general "strength" of the metal as the engineer understands it.

In this respect, which is scientifically the correct way of attacking the subject, it cannot be said that much progress has been made, but, on the other hand, tests have been evolved which, whilst not measuring a single property whose relation to the strength of the metal is known, do give us much more complete evidence of the strength of the metal than we have had before.

These tests may conveniently be grouped under the headings of static (tensional, compressive, transverse, torsional, and shearing), alternating, shock, and hardness. We shall endeavour to see what structural changes occur in each case.

Static Fracture.

The machines for carrying out the static tests are of two types—the lever machine and the hydraulic machine. In the former a lever is used with a travelling weight which, as it is moved along, exerts

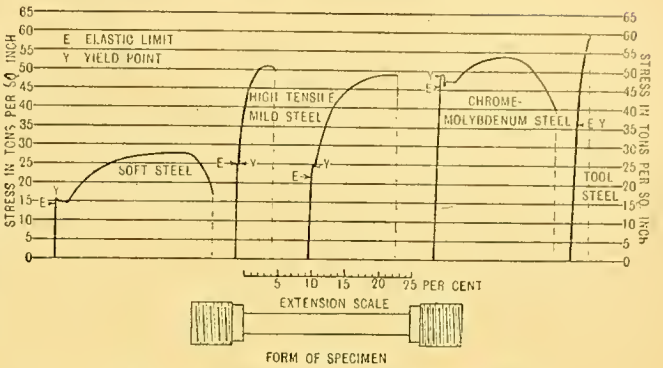

Fig. 2.—Stress strain diagrams for special steels.

a gradually increasing stress upon the piece of metal which is being tested. In the latter a direct pull is put upon the specimen of metal by hydraulic means, the pressure exerted being measured upon a suitable gauge.

Fig. 1 shows a photograph of a lever machine arranged for conducting tensile, bending, and shear tests made by Messrs. Buckton and Co., of Leeds, to whom the writer is indebted for the photograph and diagram arranged for taking a tensile test. The piece of metal T has been carefully turned up and its diameter measured. Two punch marks are made on the specimen 10in. apart, in order that the stretching may be measured after the specimen has broken. One end of the specimen is then clamped by means of wedges to the holder suspended from the lever, and the other end clamped in a similar manner to the screw shown at the bottom of the photograph. Any stretching which occurs in the test piece is taken up by lowering the screw, and thus the lever is kept in the "floating" position and always horizontal. The photograph also shows the jockey weight and mechanism for moving it along the lever, with the scale graduated in tons from which the pull exerted can be read off.

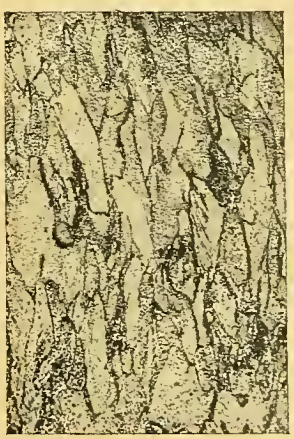

Fig. 3.—Elongated crystals of steel under stress.

On subjecting the specimen to the gradually increasing pull, it first stretches slightly according to Hook's

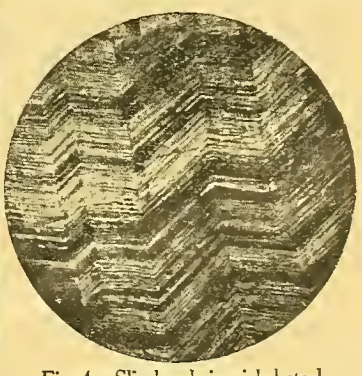

Fig. 4.—Slip bands in nickel steel (Edwards and Carpenter).

The Mechanical Testing of Metals.—

law—the stretch being proportional to the stretching force. During this period the metal is elastic, and will return to its original length if the pull is taken off. When the load reaches a high value the metal will change from the elastic to the plastic state. This particular load is known as the yield point for the metal (Y, fig. 2). A period of instability now ensues, during which the minimum load is taken as the elastic limit of the metal (E, fig. 2). The specimen now rapidly stretches under increasing load until finally local stretching occurs and the test piece breaks. The course of these changes is shown in fig. 2 for several steels, the curves showing the relation between the stress in tons and the stretching or strain calculated as a percentage of the original length.

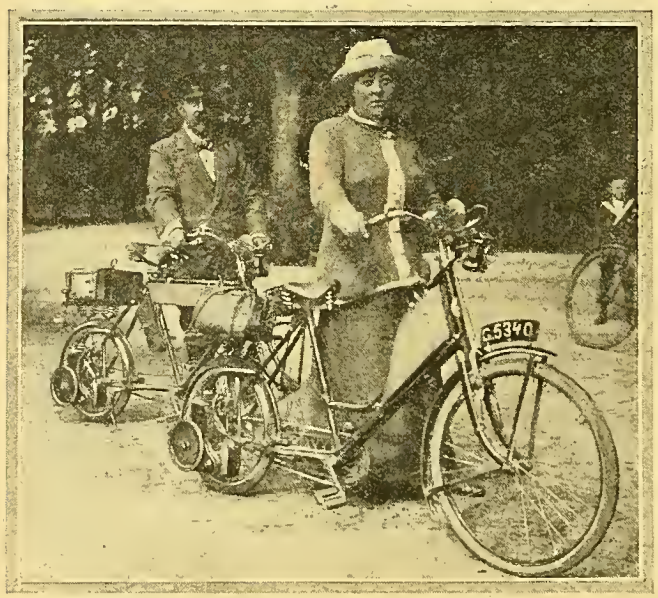
Examining the metal microscopically, we see that the original metal consists of an aggregate of crystals. The crystals are gradually elongated under stress (fig. 3), and accommodate themselves to the new conditions by a process of slip along the gliding planes. Fig. 4 shows the slip bands which develop in the metal as a result of the slip. As an illustration of what takes place, we may notice how the leaves of a book accommodate themselves by sliding over one another when the book is bent.

During the process of slip it is now considered that the metal on the surfaces of slip loses its crystalline character and becomes amorphous. In this state it is of the nature of glass—*i.e.*, non-crystalline—and is harder and stronger if the amorphous metal is allowed to set. If the stress is maintained the temporary mobile amorphous metal allows the slip to reach its limit, when fracture follows, and the metal exhibits a fibrous appearance due to the elongated crystals.

(To be continued.)

A "LAPSUS PENNÆ."

WE are in receipt of a copy of "The Harley-Davidson Dealer," of which the most imposing feature is the whole-page photograph of a number of Harley-Davidson sidecars outside Shakespeare's birthplace in Stratford-on-Avon. The enterprising Englishman who wrote the short article entitled "A Ride through Historic England" has been guilty of two fearful howlers, which have been the source of much amusement to his colleagues. In the first place, he points out that the cross at Banbury is one of the historic chain of crosses which stretch from the North of England to London, and goes on to say that "when Queen Elizabeth died her husband—one of the early Edwards, I think—brought her body to London, and on the spot where the bier rested at the conclusion of each day's journey he afterwards erected a cross to her memory." Banbury Cross is merely a market cross, and Queen Eleanor's body followed a different route altogether. It is interesting to note that Charing Cross, the last resting-place of Queen Eleanor before the *cortège* reached its destination, derives its name from the French *Chère Reine*. The words, however, according to Dr. Brewer, do not refer to the Queen, but to the Virgin Mary.

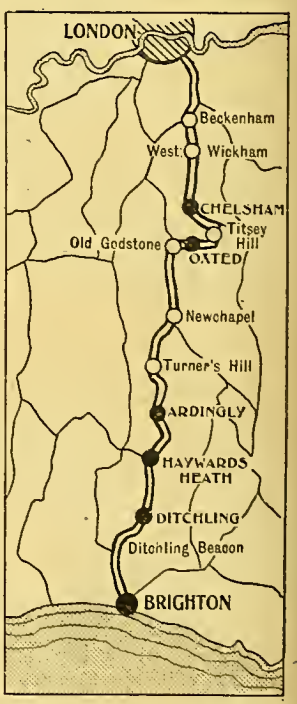


AN AUTO-WHEEL MODIFICATION.

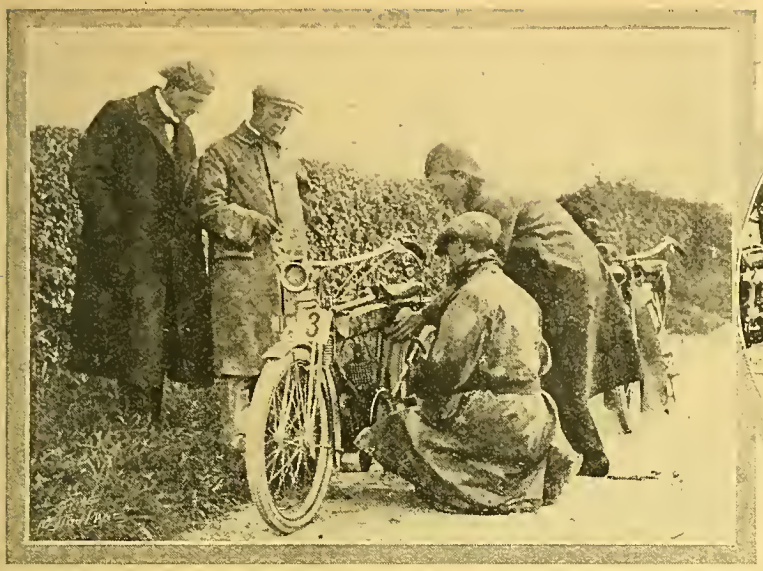
Two Dutch cyclists who, instead of attaching the Auto-wheel to the back wheel of the bicycle, have made it take the place of the back wheel itself. The petrol tanks are located as on motor cycles, a spare tin being strapped to the carrier of the man's machine. The photograph was taken at the start of a tour.

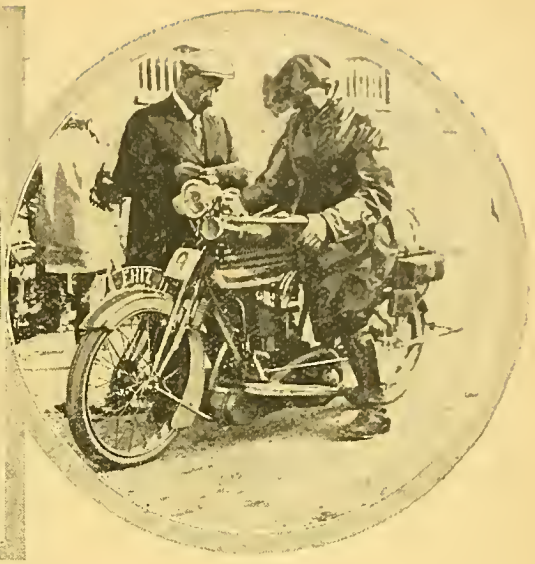
AN UNFREQUENTED AND PLEASANT ROAD TO BRIGHTON.

THE accompanying sketch map shows a road from London to Brighton which is far pleasanter than the more usual routes. The correspondent, LO 3009, who sends us this route, tells us that on a recent trip he only passed two sidecars, one on Titsey Hill and the second on the main Eastbourne Road, between Godstone and Newchapel, and one car on Turner's Hill, and met about ten motor vehicles, while he was passed by none. The scenery on this route is unrivalled. Those whose machines have plenty of power and ground clearance can further improve the route given by going over Ditchling Beacon instead of through Clayton and Patcham.



There must be many of these by-way routes in different parts of the country which are often far pleasanter than the main roads, while the surfaces are generally not much inferior, and in some cases superior, to those of the more important highways.



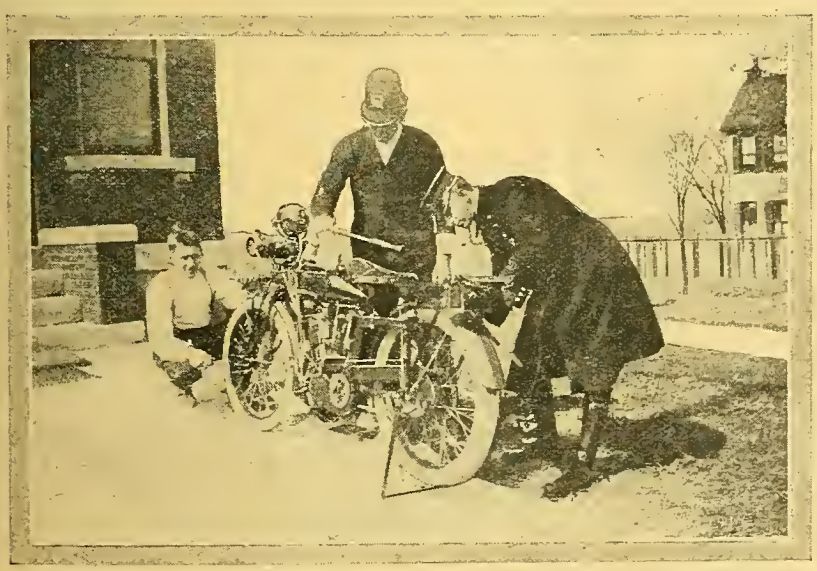


THE IRISH ONE DAY RELIABILITY TRIAL. (See page 234 of last week's issue.)

R. W. Stevens (2½ h.p. Sun) makes an adjustment with plenty of assistance. George Roche (3½ h.p. Rover) checking in at a control.

CHASING BURGLARS BY MOTOR CYCLE.

WE are all familiar, by name, with the American "speed cop," who, armed with a revolver and riding a high-powered motor cycle, chases motorists who are exceeding the speed limit. Throughout the United States the police use motor cycles to a great extent, the latest use to which they are put being in Cincinnati. Special buildings have been set up in various parts of the city and suburbs, each of which has accommodation for two or three motor cycles, besides the necessary police. These men are used for special emergency work, such as burglaries. By this means Cincinnati is now freer of burglars and other wrong doers than at any time in her history.



American motor cycle police tuning up a "speed cop's" mount. The photograph was taken at Cincinnati.

IRISH ONE-DAY TRIAL RESULTS.

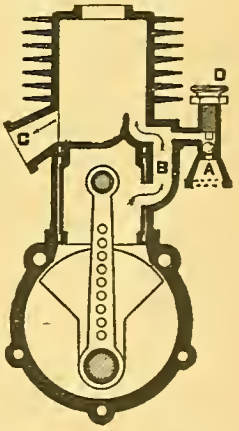
THE following competitors received first-class awards in the one-day trial of the Dublin and District Motor Cycle Club, held on the 28th ult., and reported in our last issue:

J. E. Greene (6 Bradbury sc.).
W. J. Henderson (7-9 Harley-Davidson sc.).
V. J. "Farren" (5 Indian).
P. H. Hurse (4¼ B.S.A.).
G. Mayne (10 Calthorpe).
R. W. Stevens (2¼ Sun).
G. A. M. Curtis (7-9 Indian sc.).
D. Allen (2¼ Sun).

The following completed the course:
A. Mooney (6 Bradbury sc.).
S. Allen (3½ James).

AIR SCAVENGING DEVICE FOR TWO-STROKES.

A SIMPLE device for obtaining better scavenging on two-stroke engines is a little air valve manufactured by the Portway Cooper Manufacturing Co., of Braintree. It consists of a ball valve A fitted with an adjusting screw D to regulate the amount of air admitted. The principle of working is as follows: On the commencement of the upward stroke of the piston a partial vacuum is produced in the crank case and transfer passage B, which sucks open the air valve A, filling the passage with pure air. As the piston proceeds on the upward stroke the inlet port is uncovered, admitting a fresh charge of gas to the crank case, the piston then descends, opening the exhaust port C, and also the transfer port. The fresh charge which is compressed in the crank case is forced through the transfer port into the cylinder, preceded by the air which is already in the passage. In a two-stroke the incoming gas has to assist in forcing the burnt gas through the exhaust port, and in the ordinary way a certain amount of the fresh charge is exhausted with it. When, however, the air valve is fitted, it is claimed that none, or very little, of the fresh charge comes into contact with the exhaust gas, thereby causing a considerable saving of gas, and not only increasing the power but saving petrol.



Portway Cooper air valve for two-stroke machines.

USEFUL HINTS AND TIPS.

WITH APOLOGIES TO ROAD RIDER.

COMPRESSION TAPS.

The compression tap is a decorative brass knob, fitted in the cylinder head. Those that work usually leak, so the ordinary non-working type is to be preferred.

STANDS.

These are made in two types—the kick-up and the fall-down, the latter being most popular. They are chiefly used for spoiling the engine. A front wheel stand makes a somewhat inefficient substitute for a brick under the crank case.

KICK STARTERS.

It has been frequently urged against motor cycling that it provides the rider with no exercise, and to remedy this defect the kick starter has been introduced. When the kicker has got comfortably warm, the engine may be started by pushing on the low gear in the usual way.

CARBURETTERS.

The carburetter is fitted primarily to amuse knuts, as no other part is capable of being so easily faked to spoil the running of the machine. Control is nominally effected by slides, pulled in one direction by cables, and thrust in the other by springs, means being provided for the ingress of grit, which effectually stops the action. Much amusement is derived from re-threading cables which have sprung out of place when this occurs.

GENERATORS.

The simple drip generator being generally satisfactory and reliable, manufacturers are now turning their attention to the production of complicated automatic regulating devices; the automatic generator furnishes much entertainment through its pleasing habit of watering the road, wasting the gas, and allowing the light to go out suddenly. It should be added that automatic generators burn beautifully in the maker's showroom.

The connection between generator and lamp is usually a tube of thin rubber, with one or more kinks in it. Good rubber tubing might be had, but is not worth while, as the sharp edges of tanks, spring fork links, and the other things it rubs against cut it into short lengths in quick time. The generator is usually carried on a bracket inside the curve of the handle-bar, so as to foul the pump handle and prevent access to the petrol filler.

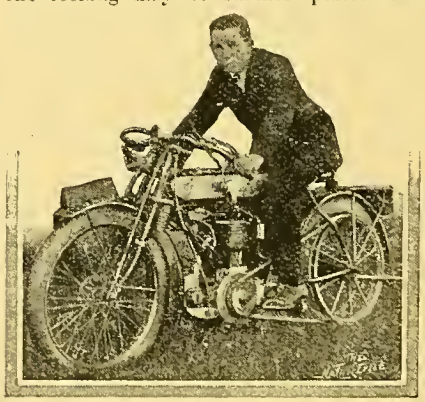
PETROL.

Alleged to be distilled from petroleum; it is treated in process of manufacture by the addition of paraffin and dirt, and sold at enormous prices. In the old days it was highly volatile and inflammable, but of late has not shown so much propensity to burn or explode rapidly, especially in an engine.

MAGNETOS.

It having recently occurred to magneto manufacturers that water is apt to cause trouble on an unprotected machine, various types of water-tight magnetos have been introduced. As a means of carrying a spare supply, however, they are not very satisfactory, and it is better to put it straight into the generator.

The toolbag is a device for polishing off the sharp corners of nuts, the thread of bolts, the jaws of adjustable spanners, and the points of sparking plugs. The heavier patterns are attached to the carrier with $\frac{3}{16}$in. bolts and nuts, so as to facilitate detachment. If insufficiently distorted by its contents, the toolbag may be further pulled out of shape by a strap fastened round its middle. The smaller the capacity, the more dusters have to be crammed in to keep the contents tight.



H. Bott, a New Zealand rider who has had a great run of successes on a 3½ h.p. Overseas touring model. In competitions this year of the Southern Hawkes Bay Motor Cycle Club he has on four successive occasions made fastest time and best performance on formula in hill-climbs, besides winning premier awards in other events.

UNIONS.

Fitted to a pipe which would otherwise be petrol-tight, these serve to indicate whether any petrol is actually passing. On the carburetter inlet pipe, they act as additional air ports to keep the engine cool; and on a twin, these unions vary in number from three to five, as two cylinders naturally require more air than one. A twin engine which proves too powerful may be made to run on one cylinder by slightly tightening one union; there is no known method of tightening both or all. The union on the exhaust pipe is to relieve back pressure.

ENGINES.

Anything that revolves with a stuttering sound. An apparatus for burning trouser-legs. An oil-slinger. The subject of engines is too extensive to be dealt with here, but a few points may be touched upon.

The engine is fitted into a cradle, attached to the frame by long bolts, threaded through holes so drilled as not to register with those in the lugs. Some engines are fitted with bearings during the first few miles. The average engine will get well run in in about five hundred, its owner sometimes at an earlier stage. Compression is a desirable quality in an engine, and may be readily counterfeited by making the piston a tight fit. It is said that an engine runs better if properly lubricated, but no actual data are available on this point. An engine will climb anything excepting when a dispassionate onlooker is present, and travel at any speed up to sixty when no stop-watch is available. More remarkable stories are extant about engines than about fish, and the narrators suppress the fact that Ananias heads their family tree.

THE SPEEDOMETER.

An instrument for enccuraging the terminological inexactitude industry. A common fallacy is to suppose that the rider fits one in order to discover the speed at which he travels: the reverse is the case. The most accurate speedometers are those in which the hand waggles over a space of five miles an hour either way, as this leaves a sporting

"Little things that help to kill big trouble."

Bates-built accessories are just as famous for excellent service as are Bates-built tyres. Everything from a belt to a puncture patch is thoroughly reliable and can be depended upon to do its job.

I have ridden several machines in the past twelve years but have never had one which gives me so much satisfaction as the

QUADRANT Combination.

Its even running is really remarkable and proves the sound way the Quadrants are built.

I have now ridden 427 miles since I left your factory, and it has never caused me one moment's anxiety. I have had no occasion to adjust any part, which is another proof of the Quadrant's sterling quality.

Those words were penned by an enthusiastic Quadrant rider — E. P. D., of Thornton Heath.

You, too, will share his enthusiasm if you ride the "query-less Q," for its service is always sure and none of those irritating "unexpected happenings" will ever mar the full enjoyment of the Tour.

Ask for particulars of our several models, including the 4½ h.p. **Sidecar Combination with B.S.A. Countershaft three-speed gear—£66 11 0.**

Useful Hints and Tips.—

chance that it may sometimes touch the correct figure. When telling your friends about it, take the highest figure; in a police court, the lowest. The maximum hand is a source of danger, and should be reset to zero before leaving the machine anywhere near a policeman.

REGISTRATIONS AND LICENCES.

Although it is said that some lawyers understand the regulations governing the issue of licences and registration of machines, there is considerable doubt as to their names and addresses. It is, however, common knowledge that registration is done by one authority, the issue of driving licences by another, and that the licence to keep a machine is obtained elsewhere; whilst the transfer of an old number to a new machine can be made for something or other, and from one owner to another for something else. Whether this information is correct the writer is not sure, and issues it without any personal guarantee.

CARBURETTER JETS.

The wise rider will experiment with different sizes of jet until he gets the best results, but it is not commonly known that jets are marked in the following way: A number of mixed sizes are put in a bag and shaken up; boys then take turns to dip for them, and pass them on to others, who have meanwhile drawn certain numbers from a second bag, which numbers are subsequently stamped on the corresponding jets. This information is derived from a comparison of jets and numbers, and it is now apparent why some carburetters burn less petrol with a .046 jet than with a .027.

HEAD LAMPS.

Manufacturers, recognising the desirability of making their accessories universally adaptable, take great pains to ensure that no lamp shall fit any other maker's bracket. Brackets are supplied with ⅞in. fittings for a 1in. bar, and *vice versâ*. Some lamps are designed to swivel sideways, to facilitate tyre repairs at night, but no special apparatus is necessary to effect this movement. The burner should be provided with a focussing device. When properly focussed, an inverted magnified image of the flame will be seen, dancing in the air a little ahead of the machine, which is pleasing, though some riders find it confusing.

Practical experience and scientific research have resulted in lamps being so greatly increased in efficiency that the 12in. size is beginning to supplant the smaller patterns. A new type will shortly be placed on the market, fitted with windows in the hood, through which the rider can see where he is going.

CLUTCHES.

Various principles are incorporated in the design of clutches, those most commonly employed being the cone and the plate system; expert opinions are divided as to which is the more unsatisfactory. Some clutches make up in fierceness what they lack in size; others atone for excessive bulk by want of grip. A clutch can be relied upon to grip when it is desired to effect a hurried disengagement in traffic; and to free itself easily when climbing a stiff hill in a non-stop trial.

As a form of humorous entertainment, the spectacle of a clutch start by a novice takes a lot of beating.

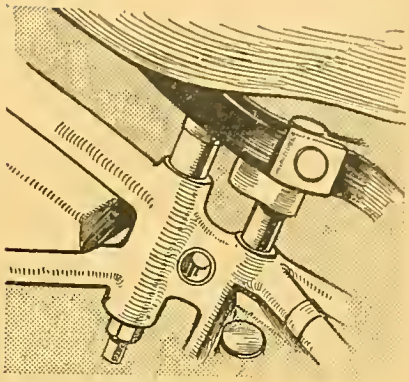
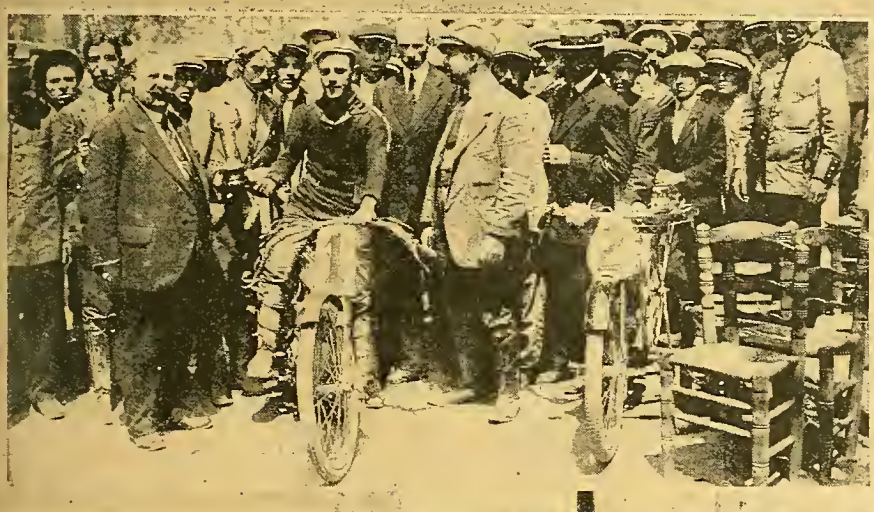
REAR SPRINGING SYSTEMS.



Spring saddle pillar on the 8 h.p. Thor—the latest American arrival.

WINNER OF THE KING OF SPAIN'S AWARD AT THE SPANISH NATIONAL TRIALS.



A motor cycle race was included in the recent Spanish National Trials, and our pictures show the winner of King Alphonso's Cup, Senor Josquin Barnola, in full flight and surrounded by an admiring group. Although competing against machines of considerably higher power, Senor Barnola, who is mounted on a 3 h.p. Royal Enfield, succeeded in accomplishing the fastest time of the day.

Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Patriotism.

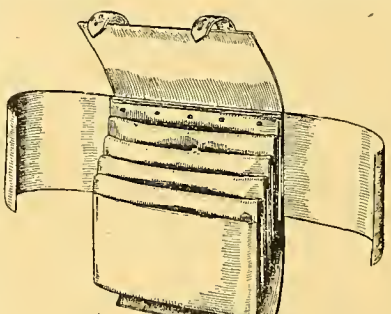
Sir,—A small, and yet great, point in "Ixion's" dissertation of August 26th deserves more prominence than the context provides for it. It is that he has foregone the pleasure of a Yankee mount on patriotic grounds.

Though I cannot obtain my fancy, I have also refused to purchase an imported machine. Quite apart from any opinion I may hold concerning American manufactures in general, or motor cycles in particular, it behoves every purchaser (for pleasure) to decide whether he will wait, if necessary, for delivery of a "native," and thus keep his money in this country, or buy abroad. If he experience difficulty in making the choice, let patriotism have a say, for it requires no lecture in economics to point the path of duty here.

H. J. SADLER.

A Tool Case.

Sir,—I have seen, with interest, the tool carrier suggested by "Uhique" in *The Motor Cycle* of August 19th. It would no doubt eliminate rattle, but the cost of fitting to existing machines would be rather high. The subject of tool kits is a sore one with me. When my motor bicycle was delivered to me last year it boasted a single tool-bag, suspended by two straps from the rear end of the carrier, and containing a King Dick spanner, valve cap spanner, screwdriver, and a sixpenny bicycle repair outfit. Of course, there was not much left of the lot after the first twenty miles, and I was rather amused when I saw "Ixion" praising the equipment of French motor cycles in the same issue.



Tool wallet described in accompanying letter.

To overcome the difficulty, I made a tool kit as follows: A strip of strong canvas (two plys) a little broader than the broadest tool carried, and of sufficient length, is folded every 3in. first one way and then the other, like a concertina, and the sides are sewn up almost to the top of the folds, forming pockets to receive the tools. Flaps are sewn on the first fold, and the upper edge of the canvas is riveted through a thin wooden board to a strip of leather as wide as the canvas. Straps are used to close the kit, and the tools, firmly held between canvas layers, never rattle. The tool kit is securely fastened to the carrier by clips and small bolts passing through leather and wood. The flaps are folded over the canvas pockets and held by the pressure of the leather cover: they prevent the loss of tools should the pockets wear through. When opened the pockets are at different levels owing to the lengths, not sewn, which is most convenient when putting the tools back in their respective pockets.

This tool kit has given me excellent service and great satisfaction, and I have found it much more convenient than the ordinary tool roll.

J. W. PARTRIDGE.

Paris.

Piston Rings.

Sir,—The attention of our clients Messrs. Allen and Simmonds, engineers and piston makers, of Reading, has been drawn to the description of a piston packing which appeared in your issue of August 12th. In this packing the rings were divided into segments, and closed at the joints by slotted plungers carried in recesses in the piston head, and forced outwards radially by springs.

It may interest your readers to know that Messrs. Allen and Simmonds are the original patentees and sole manufacturers of segmental packing rings, closed at the joints and expanded by slotted spring-pressed choke pieces or plungers of cylindrical form, in which the ends of the segments fit.

Our clients have created an extensive market for this type of packing, which, however, has now been almost entirely superseded by their well-known pressure-balanced type of segmental packing.

WHEATLEY AND MACKENZIE, Patent Agents.

The Position of the Brakes.

Sir,—I notice in your issue of July 15th a letter from "L.G.S.," in which he advocates the use of two foot-operated brakes in preference to the usual hand and foot brakes fitted to most modern machines.

At the start I must take it for granted that "L.G.S." intends that both brakes should be rear ones, as a foot brake operating on the front wheel is a great danger to the rider, since it cannot be applied as slowly as is necessary for safety.

Also, as "L.G.S." will know if he has ever ridden a machine with two back brakes, one good brake is just as effective in stopping any machine as two are. Besides which, when necessity arises for the brakes to be put on hurriedly there is a far smaller chance of side-slip if both front and back brakes are applied simultaneously.

In conclusion, I may add that two foot brakes are rather a lot to manage, especially if there is a clutch, or even a siren to be fitted on to the footrest and to be foot-worked.

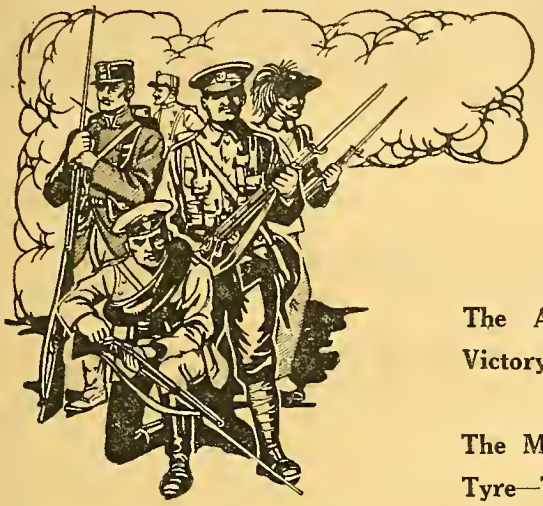
I feel that an apology is needed for having written so late after "L.G.S.'s" letter, but the case of a motor cycle with two foot-operated rear brakes has just come before me, and so I thought a remark on the subject would not be amiss.

A. STATHAM.

Double Countershaft Pulleys.

Sir,—I shall be much obliged if you will allow me space in your columns to make a few remarks upon the article which appeared recently in *The Motor Cycle* on the "Variable Pulley Countershaft Speed Gear." I am writing on behalf of my son, who is at resent doing his duty to his country somewhere in the Gallipoli Peninsular, and is therefore himself unable to reply to any criticisms directly referring to our patent No. 25,050, 1912, to which you have made reference.

We do not claim to have invented the expanding or double slidable pulley, which in itself has hitherto been a failure so far as its use on motor cycles is concerned; but this failure has been owing to previous attempts not suitably adapting the double-slidable pulley to the requirements and limited space of motor cycles. What we claim in our invention is that we have solved this difficulty, and are now putting on the market a simple and efficient multi-speed countershaft belt pulley gear which can be attached



To one End!

The Allies are fighting to one end—Victory and Freedom.

The Manufacturers of the Great British Tyre—The Clincher, are also working to one end—Victory over inefficiency and Freedom from Tyre Troubles.

B1 *In answering this advertisement it is desirable to mention "The Motor Cycle."*

to nearly every make of single-geared belt drive motor cycle in about half an hour without constructional alteration to the motor cycle.

With our patent the belts are always in perfect alignment and tension under all variations of gear, and this fact disposes of all the objections you raise with the exception of the question of the short belt.

Now, unless I have misunderstood you, I am at variance with your views on this question. I presume that your objection applies chiefly to the front short belt, and not to the rear short belt which is now being so universally used on chain-cum-belt driven machines. In this latter class of machine the countershaft pulley is larger in diameter than it is possible to have the engine pulley on the direct-drive single-geared machine, and therefore the objection to the shorter belt is disposed of. This is exactly the same in our patent, as the countershaft pulley is 6in. diameter.

Now we come to the front short belt. First, let us consider what are the objections to a short belt. I think the most important question is the one of "grip" of the belt on the pulley sides; but this only applies to the case where the driving and driven pulleys are of unequal diameter. The greater the difference in the diameters of these pulleys, the greater is the objection to the short belt; as the closer these pulleys are together, the less contact has the belt on the pulley faces, and therefore less "grip," with its consequent liability to slip. This, however, does not apply where the pulleys are both of equal diameter, as, whether the belt is a mile long or only a foot long, it has exactly the same frictional surface on both pulleys.

With our patent the difference in the diameters of the engine and countershaft pulleys is so little that the belt has the frictional surface of almost half the circumference of the pulley, even at the maximum variation of the gear. We have had this gear in practical test for the past twelve months, and over some of the worst hills in England, and the short belt (we adopted the Whittle because it is so pliable) has stood the test well and given no undue trouble; and having given the gear such a long trial with such satisfactory results, we feel justified in claiming that, if the previous attempts to utilise the double or sliding pulley on motor cycles have been a failure, then the difference between those patents and ours is just the difference between failure and success. W. WILBERFORCE WALL.

'Midst Scottish Crags.

Sir,—I should like to express my appreciation of an article which appeared in *The Motor Cycle* of November 19th last year from the pen of Mr. George D. Abraham entitled "Autumn 'Midst Scottish Crags." Having a week's holiday, and not being able to make up my mind where to go, I was looking over some back numbers of *The Motor Cycle*, and I came across this article, and, after calculating mileage and time, decided to make the trip. I was accompanied by my wife in sidecar and a friend and his wife and boy of four years of age on a similar combination. Our machines were the 1915 Matchless, and I may say that from start to finish of the 768 miles they gave every satisfaction. We set out on Saturday, August 14th, and, after spending the night at Penrith, reached Glasgow on the Sunday afternoon, and on the Monday we set forth for the mountains and lochs. Taking the advice of a friendly garage man, we did not go through Dumbarton, but turned off the tramlines to the right just before reaching this place, and thence on to Balloch, where we again joined Mr. Abraham's route. With this exception and a short deviation from Connel Ferry to Oban and back, we followed the route given in the article right round to Edinburgh. At Connel Ferry Bridge the charge was 4s. for each combination and 2d. each passenger. Mr. Abraham gives his charge as 5s. 4d. The road from here was very stony and loose. In places loose slate covered the road to a depth of three inches or more, but, fortunately, with the exception of a puncture from a sharp flint in my friend's back tyre near Loch Creran, we were free from tyre troubles till, at the end of 600 miles, I got a hob-nail in my front tyre. We were also very fortunate in having fine weather, no rain falling while we were riding from the time we left Glasgow till the following Sunday, when we were nearly home. The road by Loch Laggan was mostly very bumpy, and on arriving at Laggan bridge we had no difficulty in following Mr. Abraham's short cut over the moor to Dalwhinnie, where the road became first-class again. Callander to Stirling and part of the way to Edinburgh was not so good, pot-holes abounding. After spending a day in Edinburgh, we returned to Penrith by way of Galashiels, Selkirk, Hawick, and Carlisle, which was a splendid road, except near Edinburgh. All the party agreed that it was the finest holiday they had ever spent, and, although a good deal of rough road had to be covered, the scenery amply compensated for it.

In conclusion, I should say that anyone attempting this trip should carry a spare tyre or two, and a strong machine and sidecar is essential. Anything like a light combination would, I am sure, get shaken to pieces.

JOHN GIBSON.

Pay Day with the M.M.G.S.

Sir,—As your valued journal has been first and foremost in stimulating and aiding the recruiting for the Motor Machine Gun Service, I do not think it too much to ask you to use your influence again on behalf of those same recruits.

I understand from young men who have joined that a pay-day would be welcomed with no little joy. Evidently there must be a slackness somewhere, for young fellows who have left good homes, sacrificed good livings, and who always had plenty of cash, to be kept five or more weeks without so much as being paid a halfpenny, leaving them to be continually drawing on their savings or home finances.

We are not unpatriotic, but surely, Mr. Editor, this is no stimulus to young men intent on serving King and Country, and surely your paper can do something towards amending these financial difficulties.

Certainly this should never have been allowed, and if there is any material reason for such a state of affairs to hear of it through the columns of your paper would oblige

G. MAIN RUSSELL.

[THIS LETTER WAS SUBMITTED TO THE COMMANDING OFFICER OF THE M.M.G.S., WHOSE REPLY IS APPENDED.—ED.]

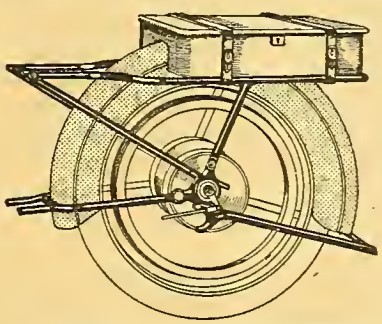
The statements contained in the above letter are entirely false. All men of the M.M.G.S. present in this camp, or in outlying camps with their batteries, are paid regularly every Friday.

If G. M. Russell will come here any Friday he can see things for himself. Meanwhile, it is his duty to substantiate his statements or make an ample apology.

Bisley, 3/9/15. R. W. BRADLEY, Lieut.-Col.

A Roomy Tool-box.

Sir,—Seeing correspondence on the subject in a recent issue of *The Motor Cycle*, I should like to draw attention to a good tool-box (in which I am not interested), the present pannier bag being, undoubtedly, too small.



Tool-box referred to in the accompanying letter.

I have an 8 h.p. Rex, which machines are fitted with a large metal tool-box. It is lined with rubber, and into it can neatly be packed a full tool-roll, chain parts, tyre outfit, spare tube, engine valve, oilcan, etc. A lock and two straps hold the hinged lid firmly, and the "rattle bogey" is non-existent. This tool-box is very strong, capable of carrying very heavy luggage, and is very neat and weatherproof. The frame is made of D tubing, and is fixed to the cycle frame, not the mudguard. In combination with a spring carrier it should approach the ideal. F 8768.

Motor Cycle Volunteers.

Sir,—Although not a member of the Motor Cycle Volunteer Corps, I am very interested in the movement, and I should feel very much obliged if I might trespass on your valuable space to reply to "M.B.'s" last letter.

First, as to the corps "playing themselves" at the foot of Style Kop, I may state that they were carrying out a

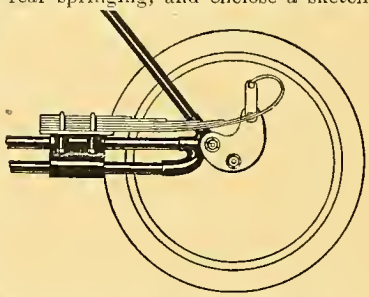
manœuvre previously arranged and advertised in the programme, and were not merely casually "acting the goat," as the tone of "M.B.'s" letter seems to suggest.

Secondly, with regard to the back door enlistment, not only has the letter from the M.M.V.C. answered this, but also it must be obvious that men who are sufficiently sporting to give up their spare time and money to carry out reconnaissances, despatch rides, etc., often under adverse conditions, must surely be sporting enough to enlist in the Regulars if possible. If "M.B." would see the corps at their usual work at any week-end he would be certain to alter his opinions. If the Regular Army were only seen at a tent-pegging competition, or the Navy only seen when giving a display for some charitable purpose, as was the M.M.V.C. at Style Kop, a different idea of their real duties would be formed.

Lastly, as to the "toy pistol" affair, does "M.B." object to anyone calling the attention of a friend who was passing by a little noise? AN UPHOLDER OF THE M.M.V.C.

Rear Springing.

Sir,—I am interested in the letters published in *The Motor Cycle* concerning rear springing, and enclose a sketch of an idea that has occurred to me. You will see that the only oscillating parts are the side plates carrying the back axle. I think this is an advantage over types with moving seat and chain stays. If sufficient support is given to the pivots connecting the side plates to the chain stays there should not be any side play. Double shackles or links could be used at the top if there was sufficient wheel clearance. The seat stays would have to be bent or split in order to clear the leaf spring. Also, as the side plates raise the chain stays rather much in relation to the axle, and a bent stay to lower the engine level would weaken the stay, double stays would make a stronger job of it.



M. L. HADINGTON.

Eliminating Weaknesses.

Sir,—Referring to your leaderette on this subject in *The Motor Cycle*, we can scarcely agree with your idea of sending out a commission to study the weaknesses of the various machines in use with the Expeditionary Force.

As you are no doubt aware, the various firms who are supplying motor cycles to the War Office have quite a number of qualified men in the A.S.C. who are effecting repairs to their particular make of machines. Surely these men (many of them well-known competition riders), who have been out here for a considerable period, and who have a peculiar knowledge of the conditions of use and of the machines, are better qualified to suggest weaknesses which should be eliminated than any commission which could be formed in England for this purpose.

A. B. WADE, Lce.-Corpl.
F. G. BALL (A.S.C.).

(B.E.F., France.)

[A properly constituted commission would have more authority than an artificer-mechanic, though doubtless the latter are capable men, and the very fact that the weaknesses have not yet been removed proves our contention that something more is needed.—ED.]

Mind and Machine.

Sir,—Has it occurred to you or to any of your readers that a psychic relationship may exist between the rider of a motor cycle and his engine, or, indeed, between the human mind and any piece of running mechanism? We speak of the sympathy between man and machine, of the response of the latter to the driver's will, without realising the literal sense of these expressions. I am convinced that the volition of the driver, together with a kind of affection for the engine under his control, is a positive force in the efficient running of a motor. It has often struck me that an engine accelerates, without mechanical inducement or manipulation, in direct reply to the mental suggestion of the driver. Neither is the theory unscientific. The influence of the mind on things termed inanimate is admitted by psychologists.

Inversely, the machine reacts on the consciousness of the driver. A sensitive motorist is aware of what is going to happen in the engine before obvious symptoms declare themselves. Just recently I was forewarned that my engine was about to knock, without the least mechanical indication, and with the motor running fast and smoothly.

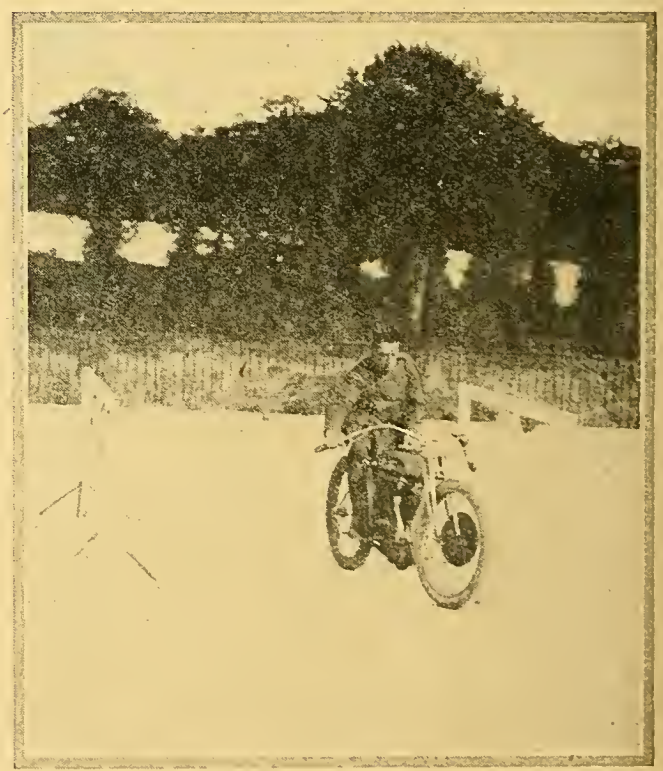
Again, it is not to be denied that a piece of mechanism has temperament and moods. There are certain qualities in engines which we cannot explain by mechanical reasoning. Some motors possess definitely moral attributes. A man whose temper is rough and uneven is never a successful motorist, and this is probably due quite as much to the fact that he lacks mental sympathy with the motor as it is to his violent manipulation. The cry of a slipping clutch plate is more than a mere noise of misused metal—it is the voice of pain!

In short, the question of the influence of the mind on machinery, and *vice versâ*, is an extremely interesting one, well illustrated by the experience of observant drivers, and opening up a new field of research and experiment. It may be noted, in conclusion, that *confidence* in an engine is an essential to its satisfactory running.

C. E. VULLIAMY.

The Supply of Sparking Plugs.

Sir,—One result of the present shortage of the best-known makes of sparking plugs, due to the demands of the war, has been a flooding of the market with cheap and little-known brands, hurriedly constructed and designed solely from the salesman's point of view. Such plugs can scarcely give satisfaction in use, and we particularly recommend caution in the purchase of plugs to-day. The safest plan is only to buy plugs of known worth and permanent reputation, even though it may mean a little delay in getting delivery. THE LODGE SPARKING PLUG CO., LTD.



BROOKLANDS MEETING FOR ARMY AND NAVY MEN.

Mechanic M. Newnham (R.F.C.), who rode a 7 h.p. Yale in the serpentine race. This new American arrival had huge handle-bars, which would alone have attracted attention.

The United Services Motor Cycle Race Meeting.

Great Success of the Second Army and Navy Meeting at Brooklands. 195 Entries

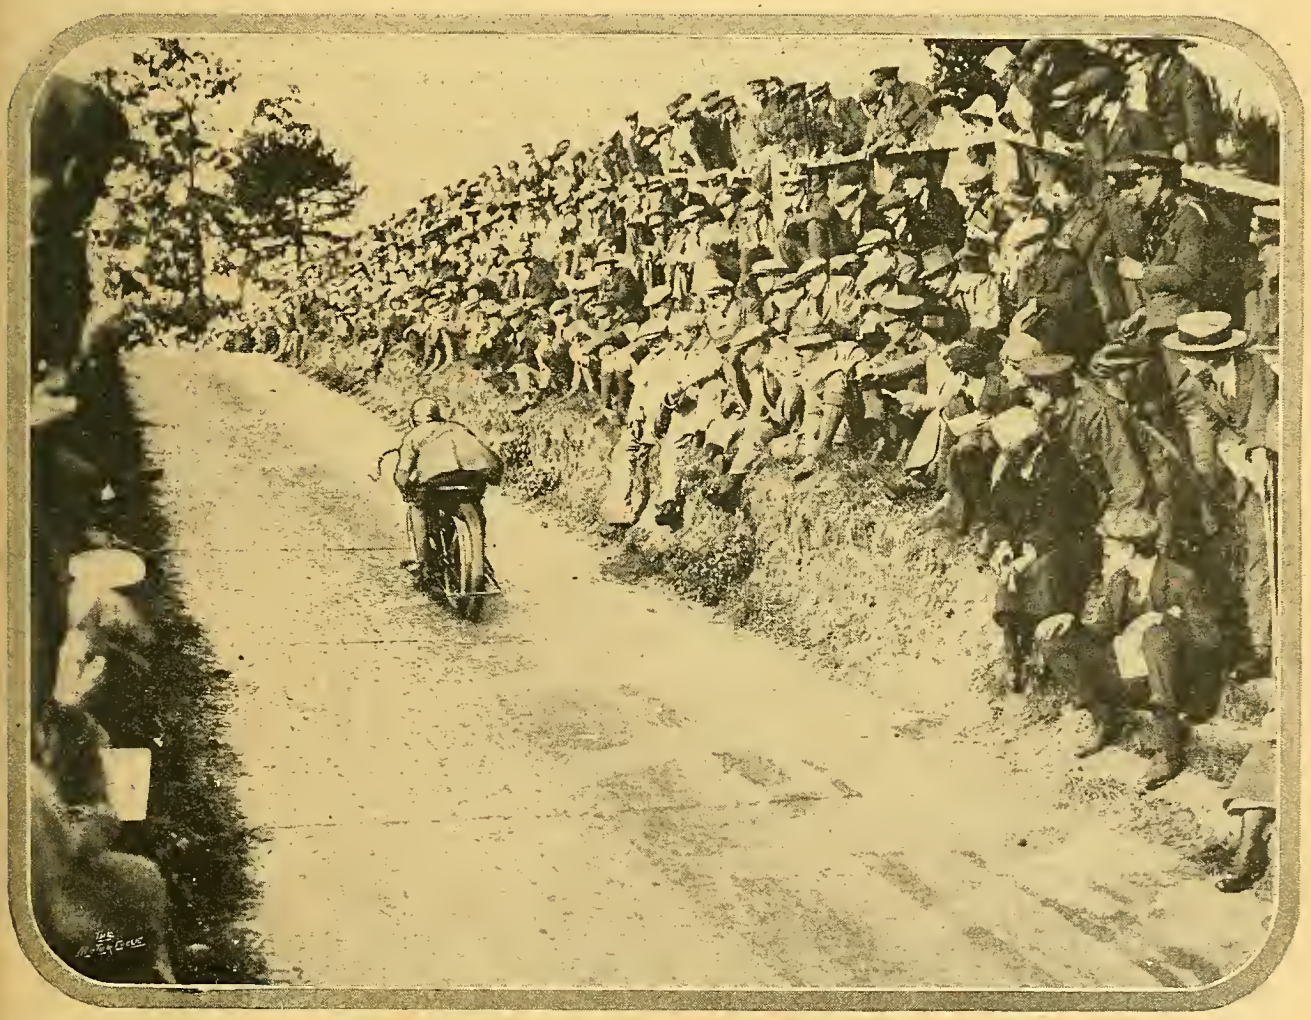
PEOPLE were kind enough to say that the All-khaki race meeting was a success; if this is so, the United Services competition was little short of a triumph. Shortly after 2 p.m. the paddock was packed with motor cycles, cycle cars, and cars, of all makes, sizes, types, and dates. Viewed from afar, the crowd assumed that drab neutral tint which showed that it consisted mainly of the soldier element. Nevertheless, the dull, businesslike colour was relieved by the bright dresses of the ladies, the blue of the brave wounded from St. George's Hill, the uniform of a Royal Naval officer, and the light blue-grey of a Flying Corps man of the French Army.

The general organisation of the meeting was excellent, and the work of the officials considerably simplified owing to the fact that the half-mile sprint races could be held on the finishing straight: this meant that the actual finish was opposite the bottom of the test hill, and therefore in full view of the two grandstands on each side of the track. Mr. Houghton's stalwart sergeants of the 25th Divisional Cyclist Company performed their duties splendidly, and kept the gates leading from the paddock to the track even as Horatius kept the bridge in the brave days of old. It was quite a "brain wave" on the part of Mr. T. W. Loughborough to send the competitors, after they had finished, back to the starting point under the members' bridge and behind the hill.

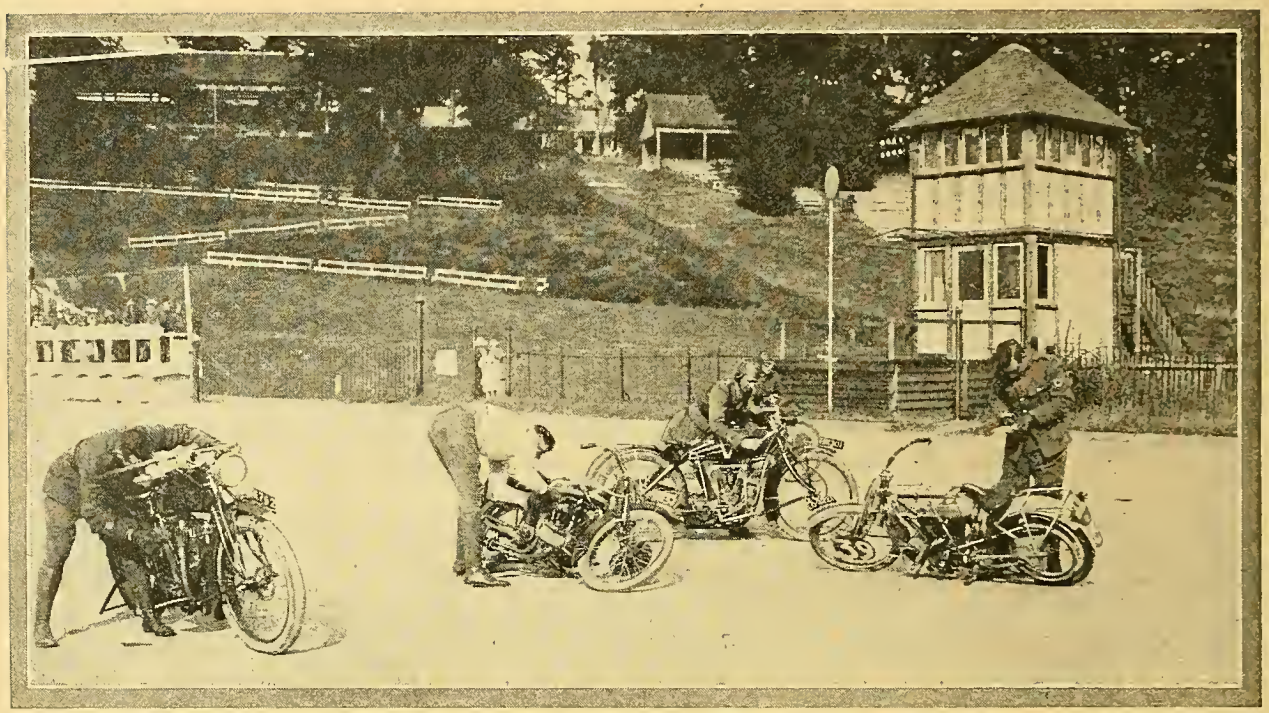
The start took place beyond the houses at the top of the straight, the unmended portion of the track being railed off by barriers. This was, unfortunately, rather narrow, and necessitated some of the events being run off in two, if not three, heats. There were no finals, the fastest men being accounted the winners, and in this way a certain amount of time was saved.

A Punctual Start.

If any fault could be found with the organisation, it was that the results and starters were not clearly and speedily announced to the public. Southcomb May, the hon. secretary of the M.C.C., and now of the M.M.G.S., did his best, but through lack of time, adequate assistance, and a proper notice board on the other side of the track, his efforts were of little avail. However, the meeting was organised chiefly for the competitors, who were all of the fighting forces (on this occasion the Royal Navy was well represented), and they really enjoyed themselves. The weather, too, was kind, and glorious sunshine favoured the whole of the meeting.



General scene at the hill-climbing contest, looking towards the top of the hill. Lieut. F. M. C. Houghton (the officer who suggested the All-khaki event to "The Motor Cycle") is seen at full speed on his Rudge.



AN AMUSING EVENT. Busy with really hot sparking plugs in the Plug Changing Contest. Most of the competitors wisely wore thick gloves.

The first event, which was down in the programme for 2 p.m., started punctually to the minute. It was the TWO-STROKE HALF-MILE SPRINT for motor cycles fitted with two-stroke engines not exceeding 270 c.c. There were six entries, and Sergt. Milner won easily. Result :

		mm.	c.c.	m.p.h.
1.	A. Milner, Sergt. R.E. (Levis)	60×70	198	38.7
2.	J. C. Bramwell, Pte. Bradfield O.T.C. (Calthorpe)	67×69	245	
3.	R. J. Slade, Flight Sub.-Lieut. R.N. (Villiers)	70×70	269	

The next event was the LIGHTWEIGHT HALF-MILE SPRINT for motor cycles with engines not exceeding 350 c.c. In this race too many competitors, considering the small amount of space available, were started together, and it was only thanks to the wonderful skill of the winner—Milner—that an accident was averted. Result :

1.	A. Milner, Sergt. R.E. (1-cyl. Diamond)	75 × 79	349	42.86
2.	F. H. Edwards, Pte. Artists Rifles (2-cyl. Douglas)	60.5× 60	350	
3.	C. L. Scott, 2nd Lieut. A.S.C.,M.T. (2-cyl. Douglas)	60.5× 60	350	

Next followed the MEDIUM-WEIGHT HALF-MILE SPRINT for TOURING MOTOR CYCLES with engines not exceeding 550 c.c. At the start Second-Lieutenant Guy, R.E., stripped the thread on a sprocket of his Scott and had to give up. The event was run off in two heats. S. R. Axford, R.N.A.S., suffered a derangement in the bottom gear of his Matchless, and could not start. Result :

1.	H. G. Hodgson, Corpl. R.E. (2-cyl. A.B.C.)	70×64	492	44.78
2.	S. W. Wright, Corpl. A.S.C.,M.T. (1-cyl. Triumph)	85×97	550	
3.	J. Bluhm, Sergt. Artists Rifles (1-cyl. Zenith)	90×77.5	498	

In the second heat of this race MacColl, who was riding a Sunbeam, had a nasty fall owing to his front tyre bursting. He rolled over and over, but fortunately escaped injury.

The next event was the MEDIUM-WEIGHT HALF-MILE SPRINT for RACING MOTOR CYCLES with engines not exceeding 550 c.c. This was run in two heats. In the second heat, in which, by the way, Lieut. Houghton, the joint secretary of the meeting, ran second, Sergt. Bluhm finished trailing his exhaust pipe on the ground. The first three in the first heat made the fastest times. Result :

1.	G. Kendall, Pte. D.L.O.Y. (1-cyl. Norton)	79×100	490	49.72
2.	H. G. Hodgson, Corpl. R.E. (2-cyl. A.B.C.)	70× 64	492	
3.	S. Wright, Corpl. A.S.C.,M.T. (1-cyl. Triumph)	85× 97	550	

Burning their Fingers.

Then followed the QUICK-CHANGE PLUG RACE for solo motor cycles of any description. The competitors had to ride a quarter of a mile, change a sparking plug lying in an envelope bearing their number, and return a quarter of a mile to the starting point. Some little confusion was caused by the arrangements being slightly altered at the last moment. On this occasion the competitors had to place the plug they had replaced in their own envelope. The competitors whose empty envelopes were left on the track were disqualified. The event was run in two heats. In the first heat Lce.-Corpl. Thompson (Douglas) was easily the best. In the second heat Pte. Charlesworth (Zenith) was quite the smartest both at arriving and getting away. The plugs were placed opposite the grand stand, and in full view of the spectators. Result :

		mm.	c.c.	Time.
1.	R. Charlesworth, Pte. N.L. O.T.C. (2-cyl. Zenith)	76×83	752	1m. 50s.
2.	H. F. Edwards, Pte. Artists Rifles (2-cyl. Douglas)	60·5×60	350	1m. 50⅗s.
3.	T. Thompson, Lance-Corpl. R.E. (2-cyl. Douglas)	60·5×60	350	

Then came the UNLIMITED HALF-MILE SPRINT for motor cycles of any description not exceeding 1,000 c.c. This event was run in four heats. It was noted in this and other races that at the start Hodgson's A.B.C. accelerated in a most extraordinary manner. In the first heat the first and second men were first and third in the final, while the winner in the fourth heat was second in the final classification. Result :

				m.p.h.
1.	G. Kendall, Pte. D.L.O.Y. (1-cyl. Norton)	79 ×100	490	50.28
2.	Noel Brown, Sergt.-Major (2-cyl. Indian)	82.5× 93	994	
3.	H. G. Hodgson, Corpl. R.E. (2-cyl. A.B.C.)	70 × 64	492	

The next event, the SIDECAR HALF-MILE SPRINT, was by no means well supported, as there were only six entries, and of these MacColl and Barker were knocked out before the event was run. C. L. Scott, Second-Lieut. A.S.C., ran a Singer light car unofficially, and came in second, but, of course, was not placed. Result :

1.	C. P. Openshaw, Flight Sub.-Lt. R.N. (2-cyl. Zenith)	90 ×77.5	986	46.15
2.	H. F. Edwards, Pte. Artists Rifles (2-cyl. Zenith)	85.5×85	976	
3.	G. J. Pidgeon, R.E. (Martin)			

A Test of Skilful Riding.

The SERPENTINE FAST RACE, open to solo motor cycles of any description, was a most interesting affair, and called for an excessive amount of skill. Barriers six feet apart were placed in sets of four at two intervals on the half-mile available, and competitors had to ride between them. Touching the ground with the foot was forbidden. Lieut. Boston, G.H.Q. Staff (A.J.S.), stopped and dropped his machine. Lce-Corpl. Thompson, R.E. (Douglas), rode with consummate skill and was heartily cheered. His perform-

The United Services Motor Cycle Race Meeting.—

ance was quite the neatest, and he was only beaten by engine power. Sergt. Milner, R.E. (Diamond), touched a barrier. Corpl. Hodgson, R.E. (A.B.C.), also failed. P. O. Kingdon, R.N.A.S. (Douglas), stopped his engine. Corpl. Wright, A.S.C. (Triumph), made quite a good performance. Art. Mech. C. F. Mossman (Zenith) touched a barrier. 2nd Lieut. F. M. C. Houghton, 25th Div. Cyclist Co. (Rudge), rode well, scraping the ground at intervals with his foot-rests. Assistant-Paymaster C. P. Marcel, R.N.R. (Indian), rode with considerable skill. Pte. Charlesworth, N. London O.T.C. (Zenith), fell. 2nd Lieut. O. J. F. Scholte, 3rd Beds. (Indian), made an excellent performance, which was heartily applauded. Of the two remaining competitors, one touched the ground with his feet, and the other stopped his engine. Result :

	mm.	c.c.	Time.
1. O. J. F. Scholte, 2nd Lt. 3rd Beds. (2-cyl. Indian)	82.5×93	994	1m. 24s.
2. T. Thompson, Lance-Corpl. R.E. (2-cyl. Douglas)	60 ×60	349	
3. C. P. Marcel, Asst.-Paymaster R.N. (2-cyl. Indian)	82.5×93	994	

Fast Speeds on the Test Hill.

The JUNIOR HILL-CLIMB for motor cycles of any description, with engines not exceeding 350 c.c., was won by the constantly victorious Sergt. Milner, whose Diamond, though it missed fire, was exceedingly fast. Result :

				m.p.h.
1. A. Milner Sergt. R.E. (1-cyl. Diamond)	75	×79	349	29.29
2. G. S. Boston, Lieut. G.H.Q. Staff (1-cyl. A.J.S.)	70	×91	349	
3. F. H. Edwards, Pte. Artists Rifles (2-cyl. Douglas)	60.5	×60	350	

Boston, like several other competitors in the hill-climbing events, approached the starting point with his engine running, and started by engaging the clutch.

Then came the MEDIUM-WEIGHT HILL-CLIMB, for motor cycles of any description not exceeding 550 c.c. In this event the performances of the A.B.C. and a Premier were most noteworthy. Result :

	mm.	c.c.	m.p.h.
1. H. G. Hodgson, Corpl. R.E. (2-cyl. A.B.C.)	70 × 64	492	32.6
1. G. W. Huntbach, Capt. M.M.G.S. (1-cyl. Premier)	83 × 85	493	
3. S. Wright, Corpl. A.S.C., M.T. (1-cyl. Triumph)	85 × 97	550	

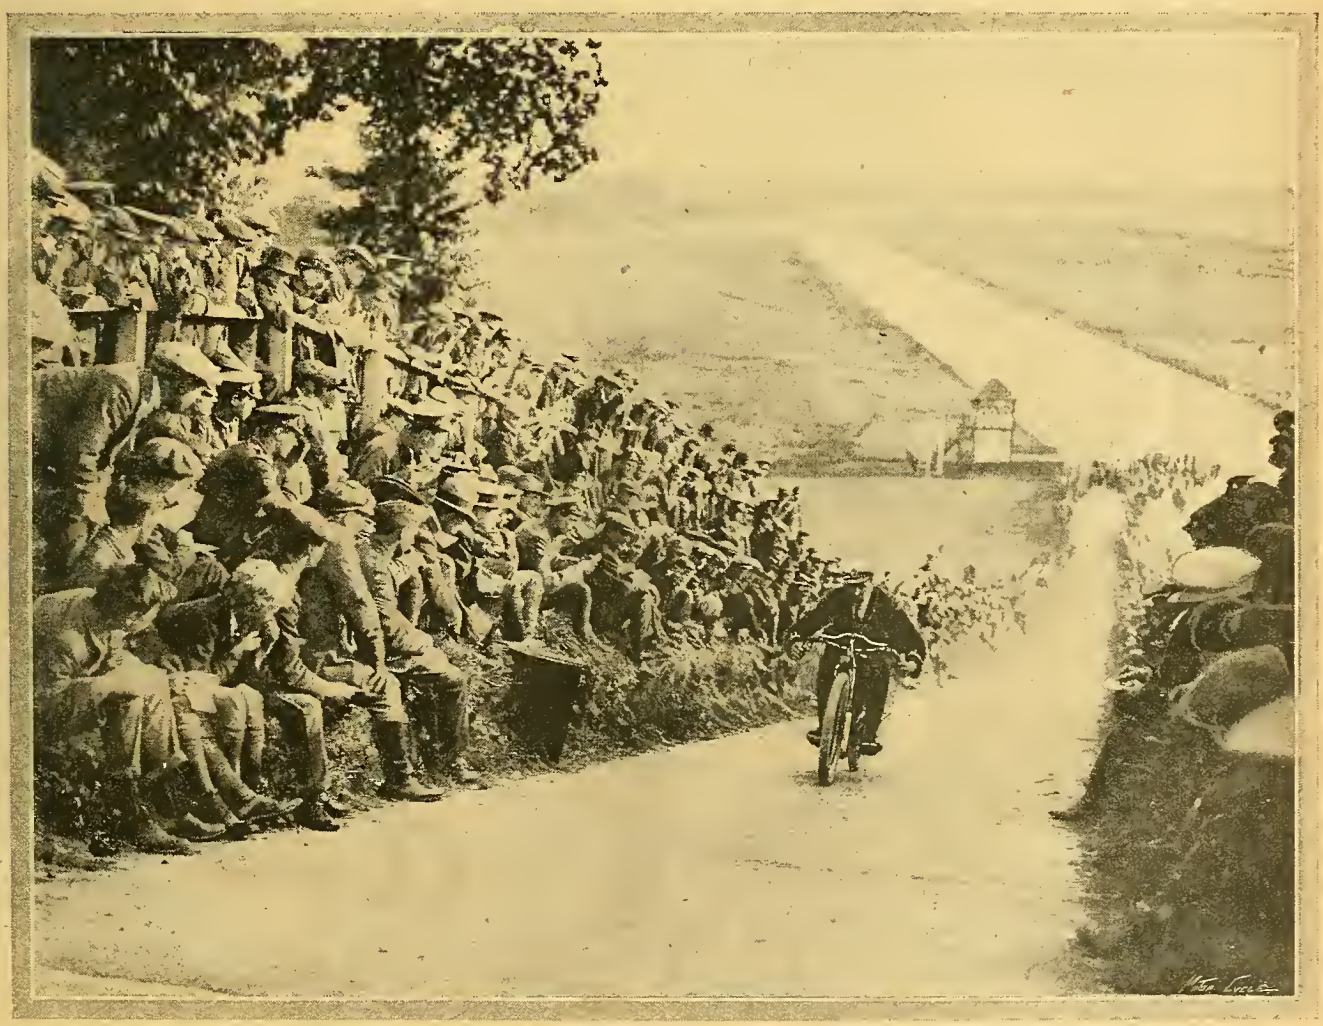
The final event was the UNLIMITED HILL-CLIMB, for motor cycles of any description, with engines not exceeding 1,000 c.c. Result :

1. O. P. Openshaw, Flight Sub.-Lt. R.N. (2-cyl. Zenith)	90 × 77.5	986	44.48
2. R. A. Waddy, Pte. Oundle O.T.C. (2-cyl Indian)	82.5 × 93	994	42.85
3. Noel Brown, Sergt.-Major (2-cyl. Indian)	82.5 × 93	994	

After the meeting the prizes were distributed by Mrs. D. F. Nicholl, wife of Major Nicholl, D.S.O., D.A.A., Q.M.G., one of the stewards. *The Motor Cycle* Cup was won by H. Graham Hodgson (A.B.C.), 9 points; next came A. Milner (Levis and Diamond), 6 points, who tied with O. P. Openshaw (Zenith), 6 points. This, the last Naval and Military motor cycle race meeting of the season, terminated with three cheers for Mrs. Nicholl.

NORTH COUNTRY HILL-CLIMB.

There is good promise in the way of entries for the Pen-y-ball open hill-climb on the 18th inst., writes Mr. Bullock, hon. sec. of the Liverpool Motor Club. There are nine classes to be decided on time only, the prizes will consist of War Loan vouchers, and the entire profits will be handed over to war charities.



A DASH UPHILL. Lieut. F. A. McNab, R.N.V., on the 1 in 6 stretch of the Brooklands test hill. He was riding a 3½ h.p. twin-cylinder Indian.

Motor Cyclists with the Colours.

Last week we met R. V. C. Brook, a leader in Midland motor cycle club circles, who is now a lieutenant in the R.N.V.R., and acting as inspecting engineer in the Royal Naval Air Service.

The National Relief Funds.

At the week-end the principal relief funds stood as follows:

	£	s.	d.
The Prince of Wales' Fund	5,471,473	0	0
The Queen's Work for Women Fund ...	164,393	5	11
The Weekly Dispatch Tobacco Fund ...	82,418	15	2
The Times Fund for Sick and Wounded	1,658,914	0	0
Belgian Relief Fund (exceeds)	835,000	0	0

A Motor Cyclist Aviator.

Mr. R. L. Charteris, who is a director of A.B.C. Road Motors, Ltd., was in the Royal Flying Corps Reserve when war broke out. He went over to Flanders in February last and sustained severe injuries to his head owing to a fall, caused by the engine of his aeroplane stopping while he was leaving the aerodrome. He is now back in England, and has received an appointment entailing the inspection of aeroplanes for the War Office. Mr. Charteris is an enthusiastic motor cyclist, and looks forward to the time when his company will be again in a position to supply the public with A.B.C. motor cycles without undue delay.

The Navy v. Army Hill-climb.

The above event will be run by the Streatham and District M.C.C. The date has been provisionally fixed for Saturday, September 25th. The hill on which the event will take place will be easy of access from London, Chatham, Bisley, and Aldershot.

CLASS 1.—Two-strokes up to 270 c.c.
CLASS 2.—Motor cycles up to 350 c.c.
CLASS 3.—Motor cycles up to 600 c.c.
CLASS 4.—Motor cycles up to 1,000 c.c.
CLASS 5.—Sidecars up to 600 c.c.
CLASS 6.—Sidecars up to 1,000 c.c.
CLASS 7.—Cycle cars up to 1,000 c.c.
CLASS 8.—Open to riders of Douglases.
CLASS 9.—Open to riders of Indians.

Entries, which cost 2s. 6d., should be forwarded to Mr. J. H. Jeffery, 2, Beemead Avenue, Streatham, S.W.

Progressing Slowly.

Mr. R. H. Lea, of Messrs. Lea-Francis, Ltd., who sustained an unfortunate accident some months ago which resulted in a broken leg, is now, we are glad to state, out of hospital, and is able to take drives in the country on a car.

The United Services Meeting.

THE NAVAL FLYING WING.—The naval wing was well represented. We noticed as a spectator Flight Sub-lieutenant W. G. McMinnies, and Flight Sub-lieutenant C. P. Openshaw, formerly secretary of the Oxford University M.C.C., was a competitor. By the way, it was not Openshaw who was mentioned in "Eye-Witness's" description of the aviator who fell out of his machine, hung suspended from a strap, climbed back to the seat, righted his aeroplane, and came safely to earth, but someone else altogether. Openshaw told us he had never been out of England since the war started.

THE ROYAL ENGINEERS (MOTOR CYCLISTS).—Sergt. Milner, who is at an R.E. training centre, was riding both his old love the Levis and a Diamond. He was well in the running for *The Motor Cycle* Cup, as regards marks, but he could not have won it, as he rode two machines.

THE ARMY SERVICE CORPS (M.T.)—Sergt. F. E. Barker was, unfortunately, a non-starter in all the events as he broke a connecting rod before the meeting began. Corporal W. Pratt did valuable work as a chief marshall.

"THE MOTOR CYCLE" CUP.—This time the aggregate prize presented by the proprietors of *The Motor Cycle* took the form of a handsome rose bowl. It was won by H. Graham Hodgson on an A.B.C., of which he was a private owner. The machine which, to outward appearance, was of standard design, was delivered in March this year. It is another triumph for a young and well-deserving firm, who, but for the war, would this year have assumed a well-merited place among our most successful makers.

THE PRIZE WINNERS.—The meeting was for officers and men. On this occasion the non-commissioned officers and men shone conspicuously as prize winners.

"MOTOR CYCLES AND HOW TO MANAGE THEM" is recognised everywhere as the standard handbook on the motor cycle. The sixteenth edition (revised) is now ready, and can be obtained from "THE MOTOR CYCLE" Offices, 20, Tudor Street, London, E.C. Post paid, 1/3 per copy.

SPECIAL FEATURES.

UNITED SERVICES MEETING AT BROOKLANDS.

THE MECHANICAL TESTING OF MET.

HINTS FOR BEGINNERS.

THE NAVAL ELEMENT.—The naval ment was far more pronounced on Sa day than on the occasion of the ". khaki" meeting. We were glad see it.

ENTRIES.—Twenty additional ent were accepted after the official clos date. This brought the total num to 195.

THE OFFICIALS.—Col. Holden, Assist Director Mechanical Transport, Capt. A. H. Loughborough, R.G. stewards, were unable to be prese We were, however, delighted to Col. F. Lindsay Lloyd and his fri Lieut. N. C. Neill, R.N.V.R., w turned up as spectators. Major D. Nicholl and Dr. A. M. Low, Lie R.F.C., did valuable work as stewar

MACHINES IN THE PADDOCK.—T variety of makes was extraordinary, novelties were few and hard to fi Quite the rarest vehicle there was 2 h.p. landau. Another type, t time a genuine motor cycle, was American newcomer, the Yale, ridc by an R.F.C. man. It had m peculiar handle-bars, and plated radi ing fins cast horizontally like the Mo sacoche. The overhead inlet valve neatly enclosed.

THE R.N.V.R.—The best kno member of the Royal Naval Volunt Reserve was our old friend Lie F. A. McNab. He has a real taste the sea, and looks a real sailor. was riding poor Jake de Rosier's twin-cylinder Indian.

Manufacturers and Government Requirements.

A week or two ago the two firms w have been supplying all the despat riders' motor cycles for the Governme (which, be it understood, has never qu represented their maximum outp received notice of a reduction in the W Office requirements, which means that larger number of motor cycles have be released for other channels. We belie we are right in stating that the surpl is enabling these firms partly to satis urgent Overseas orders.

The Clyno and P. and M. compan are apparently the only firms whc entire output of motor cycles is absorb by the British Government, and it wou appear that there is little prospect of change for some time to come.

Useful Special Constables.

Two Berkshire special constables who had had warning that a German was travelling by motor cycle from Gloucester to London, successfully waited and arrested him. He is now, we understand, interned.

Lightweights at North-country Hill-climb.

Class I. of the Liverpool Motor Club's hill-climb on the 18th inst. has been extended to include machines up to 275 c.c. Originally 250 c.c. was the limit imposed.

A Ride over Hardnott and Wrynose.

Since Mrs. Riley made her trip into Peel-land, as recounted in our last issue, she has accomplished a more ambitious trip, viz., the first sidecar crossing of Southern Lakeland from East to West. An account of this trip (with photographs) by Mr. G. D. Abraham will appear in our next issue.

Those Troublesome Tail Lights!

John R. Ashworth, of Rossendale, was summoned at Reedley Police Court, on August 26th, for driving a motor cycle without rear light. Defendant said he had been to Glasgow for a week's holiday, and when returning had an accident. He could not get anyone to repair his machine, and he had to sit up all night doing the work himself. When he looked to the rear light he found he had lost the generator. He purchased an electric light, and it answered for a time, but when he got to Kirkby Lonsdale it would not act. He then purchased a cycle oil lamp, and this acted until he got to Gisburn. It then went out, and it took him four hours to come from Gisburn to where he was reported. He used two boxes of matches in trying to get a light and spent 15s. 6d. He had to be at his work at six o'clock in the morning, but on account of the regulations he had to stay until it was light. Defendant pointed out he had lost two nights' sleep, and he was compelled to be at his work, for the firm were on Government work.

Supt. Thompson: I wish to withdraw the case. Defendant seems to have been punished enough.

The case was, accordingly withdrawn.

Some Indian, What?

The following advertisement has been extracted from the *Belfast Evening Telegraph* and sent to us by Mr. J. H. Welsh:

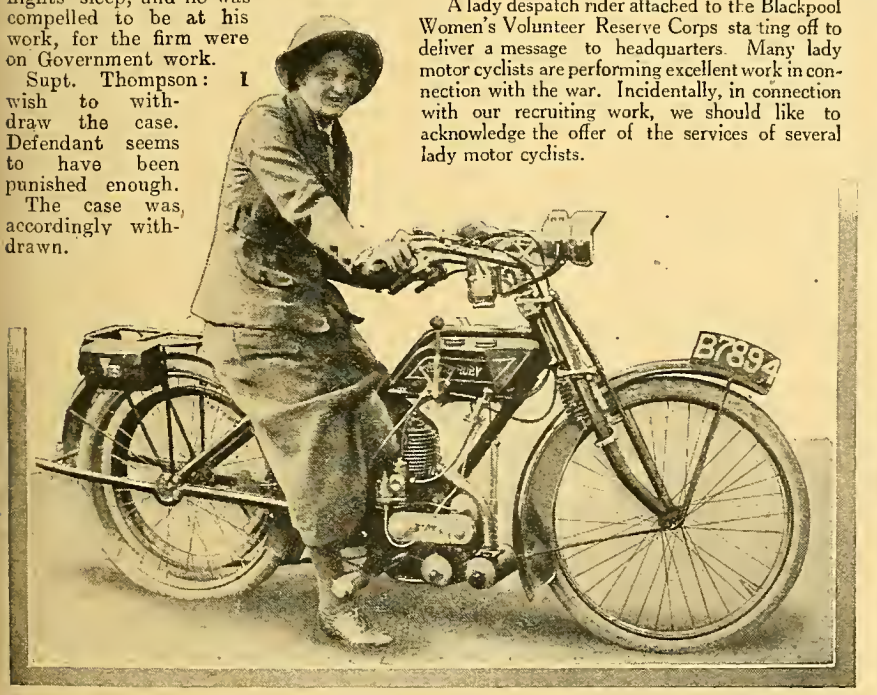
"For Sale.—1914 2¾ 3-speed A.J.S.; 1915 2¾ 2-speed A.J.S., new; *1915 h.p. Indian, new.*—Apply, Box 6,442."

Remarkable Recoveries of Speech and Sight.

The remarkable recovery of a despatch rider's speech and hearing has occurred in the case of Corporal Robert Beck, of the Army Service Corps, who became deaf and dumb whilst fighting in France. At the Palace Cinema, Aintree, he witnessed a humorous film which tickled him so much that he had to laugh heartily. Suddenly he felt a burning in his throat and a curious sensation in his ears as though they were about to burst. Then he heard a shout, and, to his surprise, found it was his own voice. Grasping the arm of a comrade he exclaimed, "Come on out, I've got my voice again." When leaving the hall, Beck seized the hand of the manager and thanked him for the funny picture; then, taking from his pocket the notebook and pencil which had been used for the purpose of carrying on his conversations in writing, he tore it in two and threw the pieces away. "No need for that now," he said, "I am speechless no longer." He then made his way to the military hospital to report his remarkable recovery.

Apropos of the above is the case of an invalid soldier who, according to report, was returning home blind, per the Allan liner *Hesperian* which was torpedoed last Saturday night. The soldier was upset from the lifeboat into the water and the shock was such that his sight was completely restored. So astonished and overjoyed was he that while still in the water he kept shouting that he had regained his sight.

A lady despatch rider attached to the Blackpool Women's Volunteer Reserve Corps starting off to deliver a message to headquarters. Many lady motor cyclists are performing excellent work in connection with the war. Incidentally, in connection with our recruiting work, we should like to acknowledge the offer of the services of several lady motor cyclists.



A.C.U. Repairer in Darkest Africa.

We do not suppose that many people make motor cycle tours in Uganda, but it is interesting to know that a repairer in that far off country has applied to the A.C.U. for official appointment.

Average Prices.

We give below the average prices for the various second-hand models offered for sale in *The Motor Cycle*. We quote those models of which at least five weekly averages have appeared during the past two months. Where it is possible to obtain a sufficient number of each model we also give the average for the past week:

Make.	Year.	H.P.	Last week's average.	Average for past 8 weeks.

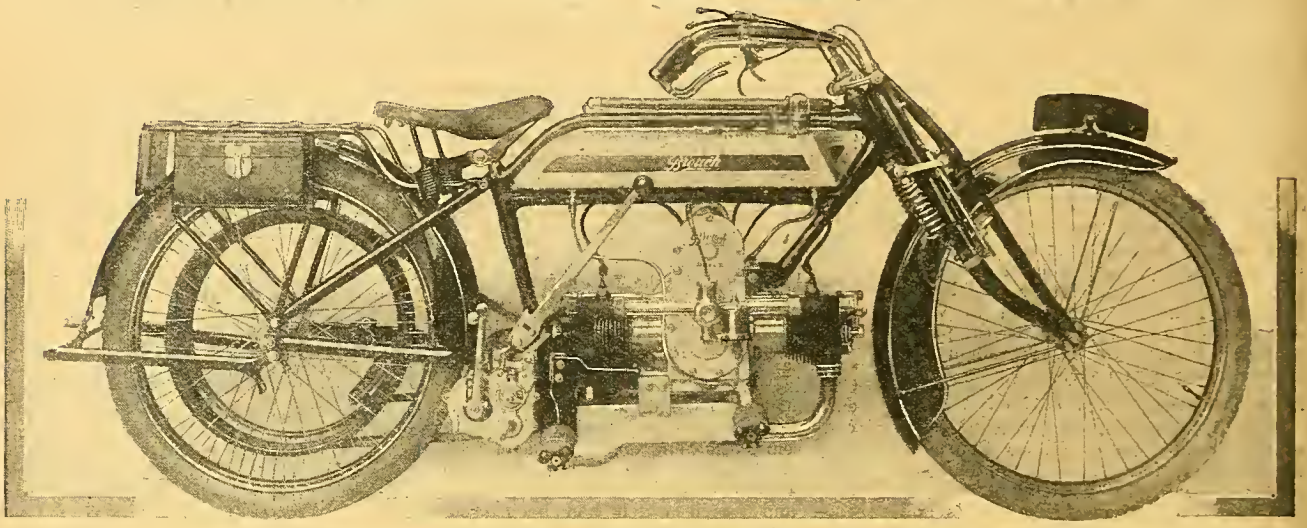
"	1913	6 Gradua sidecar	—	£45

"A Terrible Speed."

A motor cyclist was recently fined for travelling 34 m.p.h. on the Portsmouth Road at Thames Ditton. We know the trap quite well. It is justifiable when worked from east to west, as it comprises a dangerous cross-road. Travelling in the reverse direction, however, both sides of the cross-road are clearly seen, and there is absolutely no danger. Twenty-six miles an hour is enough to carry a conviction, whereas 30 m.p.h., provided the road is clear, is absolutely safe; 34 is certainly too fast. The Chairman of the Kingston Bench, when the case came on, said it was "a terrible speed for a Sunday afternoon!"

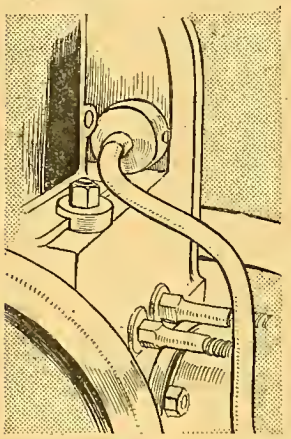
THE LATEST BROUGH.

Twin-cylinder Horizontally Opposed Engine, Three-speed Countershaft Gear.



The latest horizontal-engined Brough, fitted with Sturmey-Archer countershaft gear.

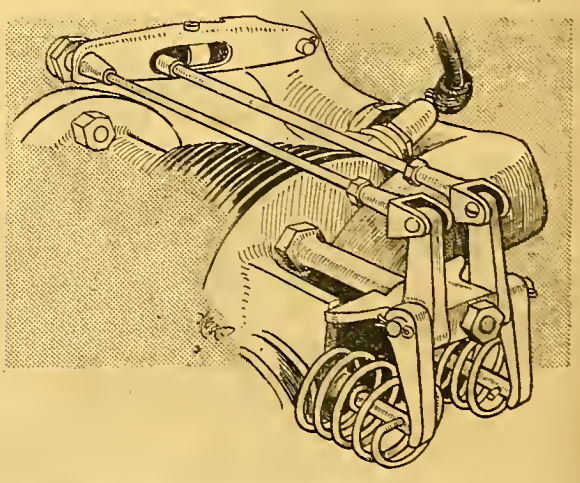
THE 3½ h.p. horizontally-opposed twin-cylinder Brough has undergone some slight modifications, and is now fitted with a Sturmey-Archer countershaft three-speed gear. The engine has a bore and stroke of 70 × 64.5 mm., 497 c.c. The cylinders are so designed as to be absolutely free from distortion by heat, the valve ports being made detachable and the exhaust ports provided with cooling flanges. The overhead valves are of large size, and make the engine very efficient. Provision is made to prevent the valve head from falling into the cylinder in the unlikely event of breakage. The pistons are specially light, and provided with three rings; in the case of the T.T. engine, light steel pistons are fitted, and the T.T. model is guaranteed to be capable of a speed of 65 m.p.h. on the road. The connecting rods and crankshaft are constructed of high tensile steel; the crankshaft is balanced and runs on large roller bearings, while the big end bearing is of phosphor bronze and adjustable. Special attention has been given to the camshaft, which runs on ball bearings, and the cams. The internal rockers are fitted with rollers to prevent wear, and Messrs. Brough claim that, after many months of research and experiment both on the road and on the bench, they have succeeded in designing a really silent valve gear combined with great efficiency. Riders who have been worried by noisy tappets do not need to be told how great an advantage that is. The tappets are, of course, adjustable.



Release valve and pipe from crank case, conducting waste oil away to the ground.

The lubrication has been carefully carried out, the oil being taken direct to the big ends and supplied equally to each cylinder. The oil sump beneath the crank case holds one and a half pints, and provision has been made for the lubrication of the overhead rockers. The method of holding the engine to the frame is by three bolts; these can be withdrawn, and the entire power unit, consisting of engine, carburetter, magneto, and silencer, can be removed from the frame in five minutes; on the other hand, the cylinders can be detached for cleaning purposes with the engine in position. The great accessibility of all parts is worthy of special attention; for instance, the contact breaker is quite clear of the flywheel, and the magneto itself, being driven through a dog clutch, is easily detachable and can be quickly replaced without disturbing the timing.

It is stated that the engine will start at the first kick even in the coldest weather, and will then tick over



Combustion head of 500 c.c. horizontal twin Brough, showing general arrangement of valve operating gear

Eleven Hundred Miles

in 3 days

from Inverness-shire to the West of Ireland with heavily laden sidecar and carrier, over the worst roads possible without one involuntary stop (except for a puncture), constitutes no mean performance even for

The Silent Grey Fellow

This remarkably fine achievement was accomplished last month by a HARLEY-DAVIDSON rider residing at Knappach, Kingussie. The magnitude of the test on frame and engine will be fully appreciated by riders who are familiar with the appalling condition of the roads in the West of Ireland

Full Marks and 1st Class Award

was won by THE HARLEY-DAVIDSON and Sidecar entered for the Dublin and District M.C.C. One Day's Trial

Proof again that THE HARLEY-DAVIDSON is the best all-round machine with powers far above the average. The seven mile grind up the Mourne Mountains and the roughness of the roads made no impression on the Silent Grey, which romped home without any trouble

The Only Motor Cycle with One Year's Guarantee

Model 11J, equipped with electric lighting and warning system is the motor cycle *sans pareil*. Fully described in the Grey Book, which will be sent on request

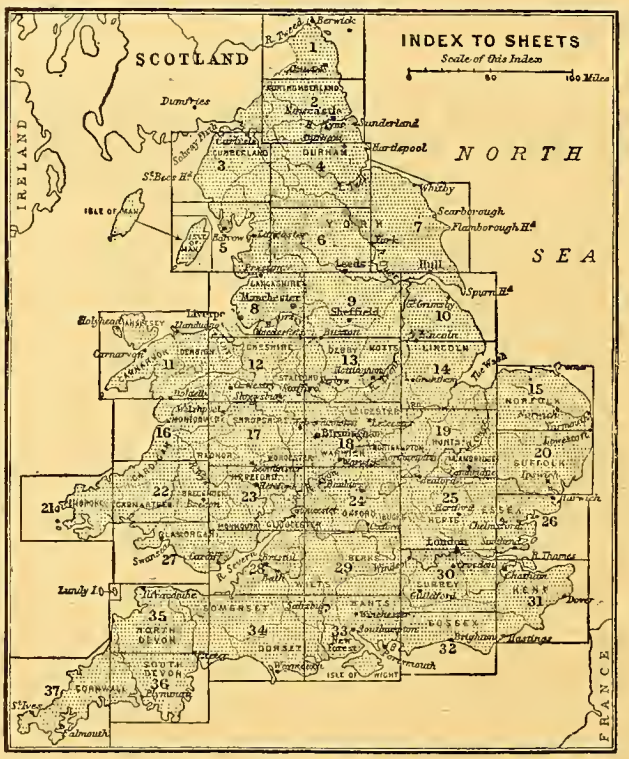
HALF INCH MAP
of ENGLAND and WALES.

(Bartholomew's.)



Please order section or sections required from this Key map.

Recognised everywhere as the best large scale map for motorists and motor cyclists.

(Scale 2 miles to an inch.)

¶ Roads are coloured red to distinguish First-class, Secondary, and Indifferent Roads for motoring, etc. Roadside Inns and Hotels are indicated.

¶ Contours of altitude are shown by various colours.

"THE TIMES" says of these Maps:

"They are beautifully clear and with every detail for all practical purposes."

England and Wales is divided into 37 sections, each section being dissected and mounted on cloth.

Price per Section, 2/6.

By post 2/8.

Price of complete set of 37 sections, £4 12 6.

Obtainable from—

ILIFFE & SONS LTD., 20, TUDOR STREET, LONDON, E.C.

(Remittance should accompany order.)

The Latest Brough.—

quite slowly, or if required exert as much as 7 h.p. for hours at a stretch.

So far we have dealt with the engine as being the most interesting part, but the cycle work is also attractive. The chain sprocket is mounted outside the flywheel; this design simplifies considerably the problem of encasing the chain in a really satisfactory manner. Two pairs of footrests are fitted. The rear brake is operated by the left foot, the front brake and the clutch by hand; Druid forks are fitted, and the front mudguard nicely valanced. Other standard fittings are Brooks saddle and toolbags, Amac carburetter, Dunlop tyres, Renold chain, and John Bull belt.

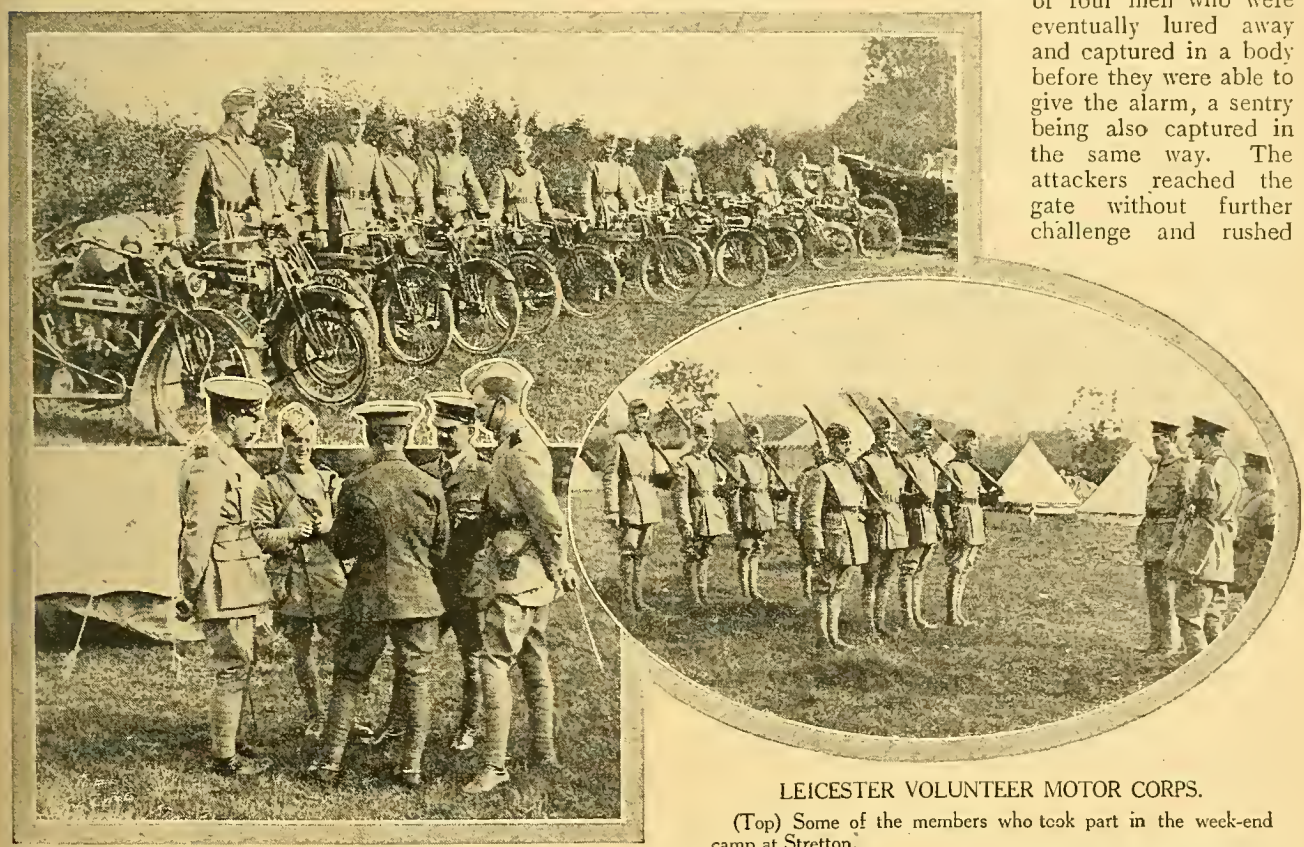
Messrs. Brough are busy making munitions, and have no Government contract for motor cycles, but yet they can number over 100 officers and men who are using their machines with every satisfaction.

With the Leicester Volunteer Motor Cyclists.

THE Leicester Volunteer Motor Corps recently spent a very interesting week-end with the Leicester Citizens Training Corps at the Little Stretton Camp. After parading at the Magazine on Saturday afternoon the contingent, under Commander C. F. Bray, proceeded to the camp.

After three hours' guard duty the corps took part in a "strategical reconnaissance" which was carried out on Saturday night. An attack on the camp was to be made by a large body of the motor corps, assisted by some of the citizens, while the defending party consisted mainly of citizens helped by a smaller section of the Motor Corps. The attack was conducted by Platoon Commander F. B. Roberts (acting adjutant), and the defence by Commander Blackney, with whom was Commander C. F. Bray.

Having assembled at Great Glenn, the attacking party commenced their operations at nine o'clock, taking advantage of all available cover, as the moon, continually breaking through the clouds, threatened to disclose their movements. It had been previously arranged that two sides only of the camp—the front and right flank—should be open to attack, so detaching a small contingent of men to act as a decoy to the enemy on the right flank, Commander Roberts with the remainder of his force made a wide *détour* to the extreme point on the left. Some clever scouting discovered the position of an enemy outpost consisting of four men who were eventually lured away and captured in a body before they were able to give the alarm, a sentry being also captured in the same way. The attackers reached the gate without further challenge and rushed triumphantly into camp. On Sunday Major-General Lord Ranksborough (formerly Major-General Brocklehurst) paid a surprise visit to the camp for the purpose of inspection, the men being paraded before him under Commander Clements. The former expressed himself as pleased with all he had seen, mentioning especially the drill and bayonet fighting of the Motor Corps.



LEICESTER VOLUNTEER MOTOR CORPS.

(Top) Some of the members who took part in the week-end camp at Stretton.

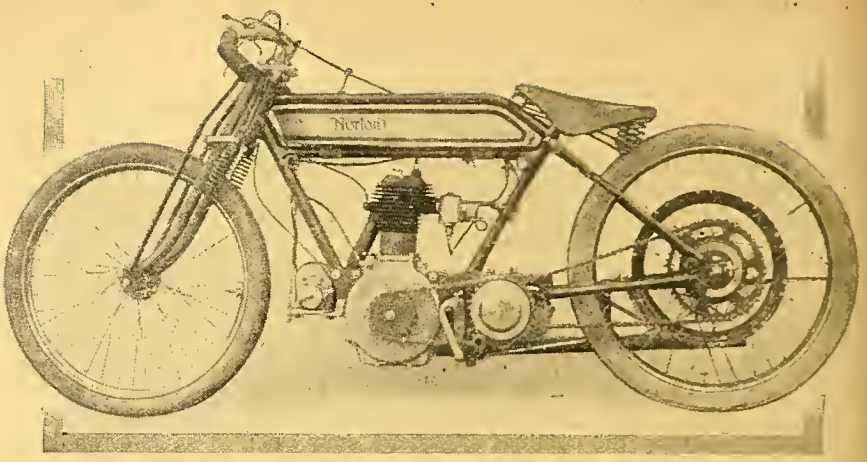
(Left) A council of war. On left is C. F. Bray (Commandant), on right F. B. Roberts (Adjutant), discussing with officers of the Leicester Citizens Volunteer Corps a scheme for the night operations.

(Right) Members of motor corps being inspected by the commanding officer of the camp before mounting guard.

B2T

A CHAIN-DRIVEN RACING NORTON.

ON the occasion of a recent visit to Brooklands we were lucky enough to meet with D. R. O'Donovan, the well-known Norton exponent, who showed us his latest chain-driven racing model. As the photograph indicates, it is a most attractive machine. Being designed purely for racing purposes, it is provided with a dummy gear box, serving merely as a support for the bearings of the countershaft. It will be noted that a large Binks racing carburetter is fitted, and a dummy belt rim for the brake, which is of ample dimensions. The machine is to be used for record-breaking.



A 500 c.c. chain-driven racing Norton has made its appearance. It is single-geared but has a countershaft drive.

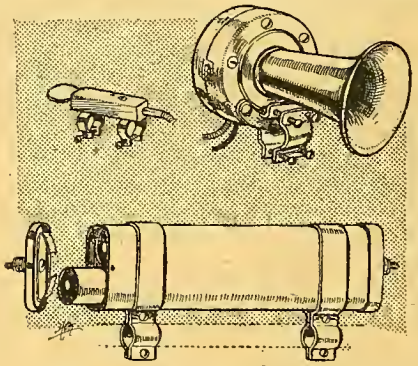
A NEW PLUG.

AN exceptionally neat and well made sparking plug specially designed for motor cycles is the A.C. Cico, which is now sold by Messrs. Brown Bros., Ltd., 15, Newman Street, W., at the moderate price of 2s. The insulator is large and substantial. The plug has a short body, consequently will conveniently go on any make of motor cycle. The electrodes, which are of efficient design, are claimed to be unaffected by over-oiling. The workmanship is good, and the plug is well finished.

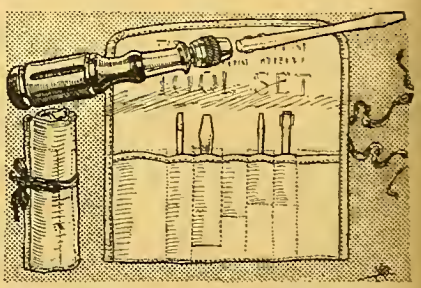
TWO DESIRABLE ACCESSORIES.

WE illustrate herewith two interesting accessories which are sold by the Benjamin Electric, Ltd., 1a, Rosebery Avenue, E.C. The electric horn is an excellent piece of work, well finished, and substantially made. This is a familiar feature, as numerous American motor cycles are fitted with it, such as the Indian, Excelsior, Thor, Harley-Davidson, and others. In cases where suitable electric equipment is not carried a battery, consisting of two dry cells enclosed in a neat metal case, is supplied, which can be fitted to the top, or any convenient tube. The interior parts of the horn are accessible for adjustment.

Another useful accessory sold by this firm is a set of screwdrivers, which form a handy addition to any motor cyclist's garage. The screwdriver is provided with a chuck end, and in the case are supplied screwdrivers of four different sizes, one of which is specially designed for reaching inaccessible screws.



The Benjamin Electric Horn, showing battery and switch.



The Benjamin friction drive tool set.

WOUNDED SOLDIERS IN THE PEAK DISTRICT.

THOSE employees of Messrs. Rolls-Royce, Ltd., who own sidecars recently took a party of wounded soldiers and some members of the nursing staff for a run into the Peak District. A start was made from Derby barracks at about 1.30 p.m., and, headed by a Rolls-Royce car, the party set off for Duffield, encountering a severe thunderstorm on the way. Thence the route led to Cromford and Grange, where a stop was made for tea. Haddon Hall was visited and the party returned through Matlock.

A sidecar outing for wounded soldiers was recently arranged by employees of the Rolls-Royce works at Derby, many of whom are enthusiastic motor cyclists.

THE "ZILLA" BELT
LEATHER & RUBBER.
(COMBINATION).

The BELT that is breaking ALL RECORDS. The ONLY Belt on the market which carries a GUARANTEED MILEAGE.

ANOTHER UNSOLICITED TESTIMONIAL.

88, High Street, Wincobank, Sheffield, 22nd July, 1915.

Sirs—I cannot speak too highly of the "Zilla." My machine is an 8 h.p., and I have done over 2,000 miles in the worst of weathers with the "Zilla" Belt with the greatest of satisfaction.

I might say I have tried each of the following (here follow the names of five well-known makes of belts), but only found success when I started using yours. I have put it to the severest of tests in Derbyshire and the Peak district, but have not known it to fail.

Yours faithfully, J. SMITH.

Now is the time to buy a belt that will PULL in all WEATHERS. SEND AT ONCE FOR NEW CATALOGUE and PRICE LIST.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

How to Descend a Hill.

Will you kindly let me know which is the correct method of driving down hill? I have a 1913 single-cylinder and sidecar, and have had the misfortune to break two exhaust valves in about three months. My friends say it is through lifting my exhaust when going down hill and not shutting off the gas.—B.F.

When descending a hill there is no objection to your raising the exhaust valve. The only danger is in partially raising the exhaust valve and allowing the engine to fire weakly, when the flame of the explosion attacks the edges of the valve and stem.

Motoring for an Invalid.

Will you kindly tell me what I can have fitted to a Bath chair to render it easy to push? My mother is an invalid, and we want to have some form of motor attachment, if possible, fixed to her chair to assist the pusher.—S.G.

We know of no motor attachment suitable for the purpose you suggest, though we have illustrated invalid chairs propelled by Auto-Wheels. Under the circumstances, we should say that the most satisfactory method of taking out an invalid would be a good sidecar fitted to a first-class machine. This would be much better than a Bath chair, and would be quite as comfortable. You could also have a windscreen and Cape cart hood.

The Legal Requirements re Brakes.

The other day, whilst engaged in a repair by the roadside, a constable noticed I had no front brake to my motor cycle. He took particulars from my licence, and said he should report me, as the law required two brakes. (1.) Am I liable to any penalty for only using one brake? (2.) Is this regulation generally enforced, *i.e.*, are there often proceedings taken?—J.M.H.

(1.) You are liable to a penalty for having only one brake fitted, but there is no need that the second brake should be fitted on the front wheel. On some machines two brakes are fitted to the rear. (2.) We do not think that this regulation is very often enforced, possibly because it is hard to tell, when the machine is in motion, how many brakes may be provided.

Insurance.

My motor cycle and sidecar is covered against all risks by a comprehensive policy issued by one of the leading insurance companies. I recently had the misfortune to break one of the chain stays of the frame through driving over rough roads with large pot-holes. The policy covers damage to the motor cycle and sidecar caused by "the direct result of accidental collision or impact with any object, etc., or by other accidental external means." Do you consider the case of my broken chain stay would be covered by the policy?—L.W.H.

It is not usual for insurance companies to pay compensation for accidents caused by rough or badly repaired roads. If your machine had been damaged by collision or a fall due to side-slip, you would have been covered by your policy.

Ignition Timing and Excessive Vibration.

(1.) How must I time the spark in the most efficient way for use with a 4 h.p. and sidecar? (2.) What would be the cause of vibration? Thinking it may have been through the small end or big end being worn, I removed the cylinder and found that by holding the connecting rod I can move it from side to side, but cannot see that it has any vertical play to speak of, although in the doing of this I get a noise which resembles what I notice when travelling.—W.J.W.P.

About the most satisfactory position for the spark to be timed is as follows: Piston dead centre (top) firing stroke; contact breakers two-thirds advanced; contact points just breaking. This setting is usually about right for any machine, but in some cases it may be found an advantage to set it a fraction more advanced, and in others slightly more retarded, but this can only be found by experiment. (2.) Excessive vibration may be caused by a number of causes, the chief being as follows: Loose flywheels; loose pulley; worn big or small end bearings; engine loose in frame. Side play in the connecting rod does not matter; it is up and down play that matters. Before trying this you should wash the engine out with paraffin. This removes all oil, and you are able to tell exactly how much play there is.

Damages in a Garage.

My motor cycle and sidecar were stored at a garage, when a gentleman driving in with a big car smashed into it, causing over £10 worth of damage. The outfit has to go back to the works for repairs. Have I any claim for hire of another machine while the other is away? His insurance company repudiates such a claim, and so I am placing it in the hands of my solicitors.—G.H.W.

We have submitted your enquiry to our legal adviser, who replies as follows: "Assuming that your correspondent is able to prove that the damage to his motor cycle and sidecar was done through the negligent way in which the big car was driven into the garage, then I certainly think that your correspondent would be entitled to recover, in addition to the actual damage, the cost of hiring another machine pending repairs. Decided cases show that damages may not necessarily be limited to the actual amount of injury done to the goods, but may also include compensation for consequential losses arising out of the deprivation of user. Your correspondent's solicitor will doubtless advise correctly on this point, which is dealt with in page 151 of 'Clerk and Lindsell on Torts,' a leading work on the subject."

Unsuitable Plugs.

(1.) My mount is a 2¼ h.p. two-speed two-stroke. I have done 900 miles, and up to the first 500 I did not seem to have any trouble, but now when I start up from cold the engine pulls well until I have done about five miles at 30 to 35 m.p.h., and then it starts backfiring. Can you please tell me the cause of this? (2.) Is 30 to 35 m.p.h. too great a speed to expect the motor bicycle to keep up, say, for two hours? (3.) How many drops of oil per minute should be given with drip feed at 30 m.p.h.?—L.J.B.

(1.) The trouble is probably due to your using an unsuitable plug, the points of which get incandescent, and cause pre-ignition after you have been running hard. Use a good single point plug with substantial electrodes. (2.) Of course, the speed is rather high for such a small machine. (3.) At 30 m.p.h. if kept up for a prolonged period, the oil drip should be kept running in an almost continuous stream.

Repairing a Blow-hole.

Having had my cylinder reground and new piston fitted, I find now a small hole about the size of a pin prick on the joint between the fourth and fifth flange from the top, probably a flaw in the casting. Would you recommend any of the following remedies: (1.) Filling up with iron cement? (2.) Could it be welded? (3.) Could it be drilled and riveted, being countersunk on each side?—E.S.L.

If the hole goes right through the cylinder steps should be taken to remedy it. (1.) We should hardly think that iron cement would be suitable. (2.) Welding would be much better. (3.) We do not think this would be at all satisfactory, welding makes a much stronger job of it.

READER'S REPLY.

Carrying an Extra Passenger.

My experience of a two-seated sidecar may be of interest to "J.F.K.," who writes in your issue of August 12th enquiring if a 6 h.p. Enfield is of sufficient strength to pull a tandem two-seat sidecar and two passengers. I have ridden a 6 h.p. Clyno, with a Millford tandem sidecar attached, for the past two years, covering some 10,000 miles, with splendid results. I have gone over roads of all descriptions, my preference being for unfrequented roads far from the madding crowd. At the present time I am holidaying in the Cockbridge district, in Aberdeenshire, where, as some of your readers doubtless know, river bed surfaces and single figure gradients abound. Particularly is that the case between Grantown-on-Spey and Ballater, which road I have covered more than once with my normal load of three in the sidecar—two children in the front seat and my wife in the back seat. The normal human load which the machine carries is within a few pounds of 30 stone, and to this has to be added the weight of spare wheel, spare tube, jack, tools, lighting outfit, and all the paraphernalia that provident motor cyclists should always carry. The sidecar is also fitted with a hood and windscreen. I have renewed my front driving chain twice and my back driving chain once, about a month ago. I had roller bearings fitted in the engine last winter. I have broken two exhaust valves. Beyond that I cannot remember any trouble that was not easily righted by a "mechanical amateur." With regard to the sidecar, the back carrier plate originally fitted was not strong enough, and it broke. This plate was replaced by a stronger one, which has now been in use for more than a year, and I have no doubt it is absolutely safe. In addition, I had an auxiliary sidecar connection fitted from the near front corner of the chassis to the Clyno lug right below the petrol tank. This stay counteracted the closing up tendency in taking left-hand corners and the spreading apart tendency in taking right-hand corners, which was quite noticeable when there was only one front connection. It should also be noted that the front sidecar seat is not comfortable for a tall passenger, but the back seat is as luxurious as that of any sidecar I have seen. —LF 2278.

EXPERIENCES WANTED.

"R.E." (Stafford).—General experience of Harcourt radiators.

"P.W.T." (Southsea).—Grade multi-pulley for use with a 3½ h.p. Precision.

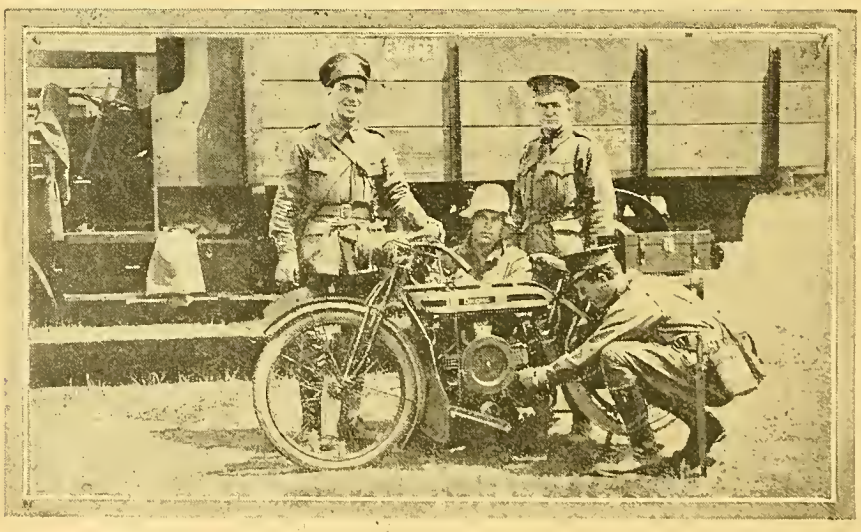
"J.E.S." (I.O.M.).—2½ h.p. Torpedo. Reliability, speed, hill-climbing, and consumption.

"Sapper" (Woolwich).—8 h.p. Zenith (clutch model) for solo work. Reliability, highest average speed, and hill-climbing.

"E.M." (Birmingham).—2¾ h.p. Douglas (ladies' model) and sidecar. Reliability, comfort, and ease of starting.

"S.W." (Hants.). — Adjustment of B.S.A. carburetter for ease of starting. General experience of Binks carburetter.

"J.M.W." (Birmingham). — 7 h.p. Indian (clutch model D) and sidecar. Tractability, hill-climbing, consumption, and suitability of 4 to 1 gear.



Australian despatch riders tuning up a Douglas. The photograph was taken in the Near East.

RECOMMENDED ROUTES.

Put *Your* Advertisement

in

THE MOTOR CYCLE

—and be *sure* of speedy and satisfactory results.

"Must be Hard to Beat."

"I may say your paper as an advertising medium must be hard to beat, as a single advertisement brought me thirteen replies for a free-engine wheel, which I disposed of. You may use this if you desire." HAROLD E. MONTEITH.
12, Gladstone Place, Stirling.

"Sold within half-an-hour."

"I should like to mention that a few weeks ago I advertised a second-hand machine in *The Motor Cycle* and had eighteen enquiries, and sold the motor within half-an-hour of the issue of your paper." F. J. MAW.
47, Skelton Road,
Forest Gate, London.

"A Shoal of Replies."

"One insertion in Miscellaneous column of *The Motor Cycle* brought a shoal of replies, and every article sold. We are unable to answer every one."
BARKER & CO.
Automobile Engineers,
Bradford Road, Huddersfield.

"Could have Sold Gear 40 times over."

"I deeply regret to disappoint Mr. —, but through the advert. (in *The Motor Cycle*) I could have sold gear about forty times over. Several wire money orders received, also cheques."
A. G. GARTON.
140, Porter Street, Hull.

"Each advert. a Great Success."

"I have had several advertisements in your paper, and each has been a great success. A short time ago I advertised an F N. engine, and as a result spent quite a small fortune returning postal orders. It was sold by wire the day *The Motor Cycle* was published, and about six weeks afterwards I had an enquiry from India. One advertisement in *The Motor Cycle* is worth half-a-dozen in any other paper." JOHN W. WALKER.
Buchlyvie, Stirlingshire.

"Forty Answers."

"I was very pleased with the advert. in your paper, having had about forty answers." (Miss) D. JACKSON.
Fairfield, Birchington, Kent.

There is
NO DOUBT
as to the
SUPERIORITY
of
THE MOTOR CYCLE
for
Miscellaneous Advertisements

It is proved week by week that quicker and better results are obtained through this journal than any other medium. :: ::

Read
THE EVIDENCE
of
ADVERTISERS

¶ **This remarkable success of "The Motor Cycle" is attributable to the fact that it has the largest circulation of any paper of its kind and is read by the right sort of people.**

"Results of ad. Excellent."

"*Re* my advt. in *The Motor Cycle* of the 10th inst., No. 6839. Although the machine was sold before issue, I received through your paper thirty replies—some of these from York, Derby, Wilts, Hants, Dorset, Sheffield, Cardigan, etc. — and several callers, two of which arrived at the same time, and were willing to bargain. I consider the results of advt excellent." E. H. COLE.
4, De Castro Terrace, Canterbury.

"Undoubtedly IT."

"A fortnight ago I advertised a side-car, which I sold the same morning as your paper came out; also a B.S.A. motor cycle, which I sold directly afterwards. I could have sold it five times over again. Your paper is undoubtedly IT." F. MERRIMAN.
"Highbury," Beech Tree Lane,
Cannock, Staffs.

"The Usual Success."

"Following the sale of my B.S.A. combination through the medium of your valuable paper, I advertised a cover and tube, and am pleased to say that the *usual success* was attained, same being sold next morning following day of issue. I was compelled to return several cheques and money orders." F. MERRIMAN.
Beech Tree Lane, Cannock, Staffs.

"Very pleased with result."

"I thought I would like to acquaint you with the success of my advertisement appearing in *The Motor Cycle*.
The same evening I received several calls; the second caller purchased machine at quite a satisfactory figure! You can guess I am very pleased with such a result, and more so as it is the second machine I have sold through your paper with similar dispatch."
EDWIN T. DEACON.
"Falconhurst," Blagdon Road,
New Malden.

2¾h.p. Villiers, 2-stroke, 2-speed, and free engine, latest model (1915), speedometer, and all latest accessories and spares, quite new; £38; write appointment any evening.—Bradford Bros., 116, Boundaries Rd., Balham, S.W. [2038

Vindec.

£11.—3½h.p. Vindec, mag., spring, adjustable, overhauled, perfect.—15, Primitive Place, Beaufort, Mon. [2061

VINDEC Special and sidecar, 7-9h.p., 2-speed, Peugeot engine.—Stirling, Garage, Stockwell St., West Greenwich. [2090

Werner.

WERNER, 2h.p., low, Hellesen, Amac, suit beginner, ride away; £6.—53, Chelsham Rd., South Croydon. [X5965

Williamson.

WILLIAMSON, new, 8h.p., water-cooled, sidecar combination; £99/5; exchanges quoted.—Motories, 68, Horton St., Halifax. [0706

WILLIAMSON, 8h.p., latest model, water-cooled combination, coachbuilt sidecar, done 2,000, as good as new, extras included; £82, or close cash offer.—27, Rylett Rd., Shepherd's Bush. [2363

8h.p. 1914 Williamson, water cooled, fitted with superior 2-seat, coachbuilt sidecar, complete with accessories; price £65; any severe trial given.—Wauchope's, 9, Shoe Lane, London. [X6151

Win-Precision.

3¾h.p. Win-Precision, 1914, coachbuilt sidecar, 3-speed, free engine, P. and H. lamps, new tyres, excellent condition; £38.—Brydon, 44, Evering Rd., Stoke Newington. [2199

Wolf.

WOLF, 4h.p., 1914, S.A. 3-speed, new tyres, splendid condition; £30.—Woodger, 307, Goldhawk Rd., W. [2234

Yale.

YALE Motor Cycle in stock, 8h.p., 2-speed, kick start; 60 gns.—Jones, The Broadway, Muswell Hill. Sole agent for N. London, trade and retail. 'Phone: Hornsey 2562. [7636

Zenith.

ZENITH, 1912, 6h.p. J.A.P., Gradua gear, Canoelet sidecar, complete; £40.—Lock, Louth, Lincs. [2339

ZENITH, 1913, 3½h.p., and sidecar, in splendid order; £36, or offer; any trial.—Corley, 88a, High St., Merton. [2080

ZENITH-GRADUA, 4h.p., 1913, tyres good, all in good condition; £32, or offer. — 88, Batterses Rise, Battersea. [2243

1914 9h.p. Countershaft Zenith, red, excellent order, property of officer; £55.—Captain Ker, Buffs Depot, Ashford, Kent. [X5921

ZENITH, 1914, 6h.p., Gradua gear, engine and tyres in perfect condition, very fast; £45.—Zenith, 12, Mulberry Walk, Chelsea. [2105

ZENITH, 1915, 4-5h.p., countershaft Gradua, clutch, new, only run 20 miles; 60 gns.—Lieut. Scarborough, Royd Lodge, Halifax. [X6186

Repairs in War Time.

FROM evidence which has reached us, it would appear that some private owners of motor cycles are inconsiderate enough to imagine that they should receive the same prompt attention to repairs as they have been in the habit of receiving in pre-war days. Difficult repairs have been sent to the various firms who specialise in such work, and, on account of more than usual delay in executing the repair, readers have been moved to complain. But we venture to remind motor cyclists in general that the conditions throughout the engineering industry are abnormal, and it behoves riders therefore to exercise a reasonable amount of patience in dealing with firms in the motor and allied industries. The difficulties these firms have to contend with owing to the shortage of men and material are enormous and almost beyond comprehension unless one has a knowledge of the actual situation. Every branch of the business is affected. Letters cannot be replied to promptly, as so many of the clerical staff have answered their country's call, whilst, of course, the engineering side is even more seriously affected, owing to many firms devoting practically all their energies to the production of munitions of war. Indeed, some of the leading firms find themselves quite unable to execute repairs for private customers, and it is only a few weeks ago that we announced, on behalf of a leading manufacturer, that no promise of delivery of repairs could be made in the future owing to the amount of Government work on hand; and, further, the company in question discouraged users of their products from sending machines to the works for repair.

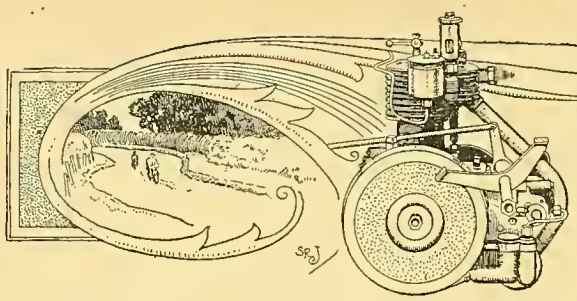
From conversations which we have had with leaders in the motor industry, we are forced to the conclusion that some members of the public are most inconsiderate at the present time, quite failing to realise the difficulties of the situation. England, owing to her insular position, is suffering less from the war than any other of the Allies. We are lucky, indeed, to be able to enjoy our favourite pastime. Consequently, a little greater consideration should be shown to those who are doing their best to keep the ball rolling in face of practically insuperable difficulties.

Government Work for Rejected Motor Cyclists.

WE have good reason to know that there are very many practical motor cyclists who have been rejected for military service by reason of some slight physical defect, which in no way affects their working capacity in civilian life. Among these are men sufficiently confident in their abilities to apply for positions either as despatch riders, or gunners, or sidecar drivers in the Motor Machine Gun Service. Some are rejected on account of flat foot, varicocele, hammer toes, loss of a finger, or slight spinal curvature, yet are in other respects in perfect health and suffer no ill-effects from the disabilities named.

We have a list of such men in our possession which, though not large, could no doubt be considerably extended by ventilating the subject, as from private conversations we are convinced that the cases we have instanced must be typical of hundreds. It does not need emphasising how wrong it is to keep at home many able-bodied men who are ready, nay anxious, to go to the Front, but who cannot be spared from the particular work they are performing, when men unfit for military service and able to perform such work are ready and willing to do so. A case came under our notice the other day of a batch of able-bodied youths desirous of enlisting who were stopped at the last moment by their employers, who, it should be added, were on Government work, but exercised their influence apparently without a thought that the men's occupation was by no means so skilled that substitutes could not quickly be found from the ranks of men unfit for the fighting forces.

An Index to the advertisements in this issue will be found on the page facing the back cover.



HINTS FOR BEGINNERS.

Some Elementary Tips on the Driving of a Motor Cycle.

(Concluded from page 246.)

IN cold weather carburetters are apt to freeze if the vaporisation is as it should be. This is not a fault in the carburetter but in its position, and the difficulty can be overcome by fitting a warming device, such as an air intake pipe which takes its supply from the neighbourhood of the radiating fins. Petrol itself does not freeze at ordinary temperatures, but benzole freezes readily, so in cold weather a little petrol should be mixed with it. Benzole gives very good results (except for the failing just mentioned), and a slightly increased mileage per gallon. Many carburetters can be used unaltered with benzole, but, generally speaking, a smaller jet is desirable, and the float may be slightly weighted, as benzole is heavier than petrol. An engine very seldom knocks when benzole is used, as, a higher temperature being necessary for its ignition than in the case of petrol or paraffin, pre-ignition is almost impossible.

We do not propose in this article to deal with carburetter tuning, as we may take it for granted that the instrument is sent out by the makers correctly suited to the engine, and that it will give satisfaction if properly handled. The rider should, therefore, aim at giving as perfect a mixture as possible, remembering that too much air is better than too little.

Lubrication.

It is very necessary to use only the best brands of oil, and preferably the particular brand recommended by the makers, who have in all probability tried a great variety and know what is best suited to their engines. The rider should remember, if using drip feed, that the oil flows much more slowly in cold weather, and should adjust accordingly. The same thing applies to some of the mechanical oiling systems, that in use on the 3 h.p. Enfield, for instance, and although, *ceteris paribus*, an engine is more likely to overheat in hot weather, lack of oil will cause overheating far quicker than a summer temperature, and, strange as it may seem, the motor sledges in a recent Antarctic expedition suffered much from overheating through this cause. Too much oil means a dirty engine, not only in the cylinder, but inside the pistons and in the crank case, and shorted plugs, but these are minor troubles in comparison with the worn bearings and damaged engine which may result from lack of proper lubrication. If the plugs get rapidly foul, or oil blows out of the crank case at the tappet and joints, it is advisable to examine the piston rings and see that the crank case release valve is in working order.

The function of a release valve is to maintain a partial vacuum in the crank case. This results in a two-fold advantage: (1) it keeps the oil from working out through the bearings, and (2) it enables the engine to turn over with greater freedom than would otherwise be the case. The valve opens when the pressure in the crank case exceeds atmospheric pressure, as the piston falls and closes as the piston rises, thus preventing air from re-entering the crank case.

Descending and Ascending Hills.

When descending steep hills, especially those which are unknown to the rider, great care should be exercised to prevent the machine gathering so much speed as to get out of hand. It is much easier to control the speed from the start than to reduce speed quickly in an emergency. Therefore, on really bad hills engage the low gear before the speed increases, and the engine will be found to be a most efficient brake. If a friction clutch is fitted it is a good plan to stop the engine on hills where the brake can be relied upon to do all that is necessary in retarding speed, remembering that when starting the engine up again by means of the impetus of the machine the high gear should be employed, the exhaust valve raised, and the clutch let in gradually. Some machines are provided with a variable gear embodying a free engine position but no friction clutch. While it is possible to coast down a hill on such a machine with the engine at rest, restarting the engine means a dismount, with its consequent delay, for if the gears were engaged with the machine in motion damage would most certainly result to the gears, and possibly to the engine.

When climbing a hill on a variably-geared machine it is better to drop into a lower gear while the engine is still turning over quickly and easily than to wait till it begins to labour. The road speed at which a change is desirable will vary with machines of different gears, but will lie between 10 and 20 m.p.h. in most cases. In changing down there is no need to lift the exhaust valve, for it is desirable that the engine should have the opportunity of quickening up a little during the brief time while it is free; the gear is then engaged without shock or jar. When the change is from low to high, of course, an opposite state of things exists, and a momentary lift of the exhaust tends to produce an easy change.

Another point in changing gear is worth noting. When it is desirable to lower the gear at a corner and the throttle has been previously closed to reduce speed, the engine does not pick up speed when free, so that it is desirable to apply the brakes to some extent and prevent the impetus of the machine from revolving the engine unduly fast when the low gear comes into engagement. This particularly applies when the drop between the gears is considerable or the speed of the machine at all high. The type of gear in which each speed is engaged by expanding rings, as in the case of the Enfield or P. and M., is eminently suited to a novice and very convenient to any rider.

Broken Inlet Valves.

My paragraph of August 19th last brought a shoal of letters, from which it appears that the 1914 engine of a certain first-class machine suffered from faulty inlet valve design. I thought one of the earlier correspondents was trying to pull my leg when he asserted that he had broken seven inlet valves in 750 miles, but later letters go far to make his claim credible. In one or two cases the makers appear to have exchanged the engines gratis, and the evidence to hand is all against seizure of the stems in the guides. I fear I must leave the mystery unsolved, as the cams do not appear to have had a very quick or high lift, and weaker springs effected no cure, whilst the firm's policy of giving a new engine in extreme cases eliminates the supposition that the valve metal was at fault. The makers are said to have played about with the faulty engines in their research department for three and four weeks at a time, and finally to have despaired of curing them. The 1915 engine is entirely free from the fault. A rider of another make of engine has experienced similar trouble, and says that the manufacturers blamed a quicklift cam, adopted at the request of the firms for whom they manufacture engines. He forwards a sample valve, which strikes me as far too light for the h.p. involved, and undoubtedly shows signs of being too close a fit in its guide. Readers in general need not worry about their inlet valves, for I have never broken a mechanical inlet valve, despite the enormous mileage and variety of mounts which lie behind me.

Leg Room.

As the few readers privileged to know me in the flesh are aware, I am a dumpy little rotund personage, with short legs; and so I feel the inherent defects of certain riding positions more than lanky, leggy riders can understand. Some of our designers appear to take it for granted that all heavyweight enthusiasts are bow-legged giants of 6ft. 6in. or thereabouts. For example, my 4 h.p. Douglas has a tank which narrows towards the rear, and is easily embraceable by my nether limbs, which resemble those of Mr. Quilp; but the machine is spoilt (from this standpoint) by a projecting carburetter, which has worn a deep recess in the calf of my left leg. My 6 h.p. Motosacoche has a parallel-sided tank of enormous width, which hoists the soles of my boots about 2in. above the footboards, and makes me look as if I were hung on a clothes-horse to dry; while matters are made worse by the vertical rod of the Enfield two-speed gear, which does for my near leg what the Douglas carburetter does for my right. Surely, most motor cyclists assist their adhesion to the machine by thigh-gripping the tank, and makers ought to remember that some of us are stout and short—well-nourished bantams, in fact.

Cleaning a Cycle Car.

What the first day greasing is to the motor cyclist, a body "in the grey" is to the passenger man. My invariable rule, where passenger machines are concerned, be they coach-built sidecar, cycle car, or light car proper, is to get the factory to agree to supplying the body in its first coat of "filling" or unvarnished ironclad grey, and to paint and varnish it royal blue or claret, or whatever the hue may be, a week before I sell it. If it is a long job to furbish up the complex details of a motor bicycle, it is a far worse infliction to conclude a long run at 11 o'clock on a cold wet night, and to know that it is your bounden duty to spend another hour or more in a draughty, ill-lit garage, hosing the mud off your precious coach varnish. It is true that you may leave the body untouched till morning—in which case much elbow grease and furniture polish will be needed to remove the spots and stains which will assuredly come out when all is dry again; it is true also that you may content yourself with hosing off the mud, and leaving the rub and dry-up till morning, in which case spottiness will be less marked. But if you don't run to a handy lad about the house and have a liking for instantaneous bed after a night's ride, get your body "in the grey." It will never look extraordinarily smart, but it will maintain a modest appearance of comparative decency on the minimum of labour.

Electric Lighting for Two-strokes.

An increasing number of riders employ the baby two-stroke for local pottering in the immediate neighbourhood of their homes. Many such owners are engaged in businesses which entail a certain amount of night-riding, interspersed with very frequent stops. The lamp of a mount employed in such work is something of a problem; good illumination is needed, and yet a bulky lamp is completely out of place, whilst acetylene generators seldom behave kindly under frequent extinguishings. I believe the best solution is a dry battery electric outfit, as the dynamo is far too cumbrous for a wee machine. For example, Ward and Goldstone supply a 6-volt outfit for 26s., including a satchel for storing the battery. The cells give about seventy hours' light, and cost 6s. per set. The same period of illumination on carbide would cost less money, but would include twenty times more trouble. There is no need to leave the lamps alight during a business call, as the machine can be lifted on to the footwalk and propped against the wall of a house, except in very busy thoroughfares. The only indispensable extra is a removable plug switch, to prevent urchins playing about with the lamp during the owner's absence inside a house. I do not think that this and similar dry battery outfits have received the attention they deserve from two-stroke enthusiasts. Of the more

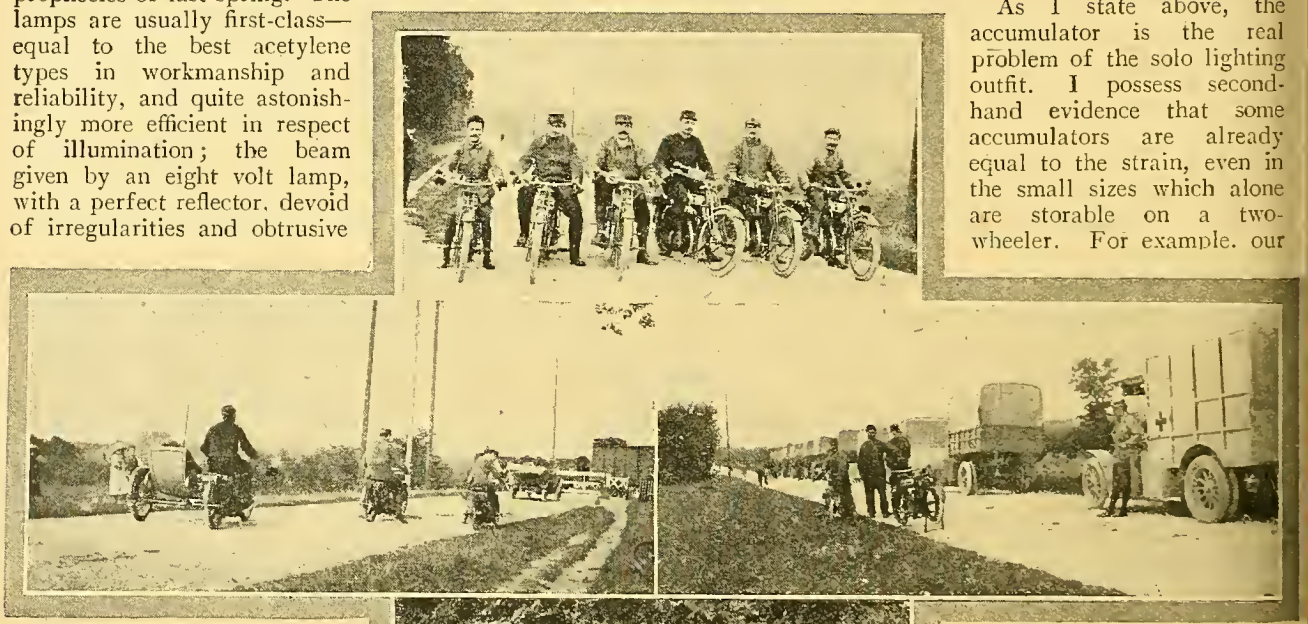
Occasional Comments.—

elaborate dynamo outfits, the type supplied by the Motosacoche people is easily the lightest, but its cost (£6 15s.) may be a little too high for lightweight users, as it represents a high percentage on the cost of a £25 or £30 machine.

Six Months on Dynamos.

I have now been doing my night work with the aid of lighting dynamos for nearly half a season, though, curiously enough, I am still without appreciable experience of two or three of the best known outfits. Up to date my chequered vicissitudes bear out the prophecies of last spring. The lamps are usually first-class—equal to the best acetylene types in workmanship and reliability, and quite astonishingly more efficient in respect of illumination; the beam given by an eight volt lamp, with a perfect reflector, devoid of irregularities and obtrusive

BRITISH-MADE MOTOR CYCLES ARE LARGELY USED BY OUR FRENCH ALLIES.



Our photographs show a group of three-speed Rover machines attached to a lorry convoy on their way to the Front.

details, is magnificent, and has increased my night speed by at least fifty per cent.; they will have a huge vogue when twenty-hour trials recommence. The dynamos have so far given no trouble of any sort or kind. The wiring details and switches seem to stand up well, and rain does not affect them as one might expect, considering the exposure and vibration to which they are subject. But the batteries are the very dickens. I should be ashamed to tell how often I have detached them for separate charging at a garage; how often I have cleaned the accumulated filth of corrosion from their terminals; how often the cells have gone to the repairer for internal treatment. The deductions are twofold. First, it takes a quite uncommon breed of accumulator to withstand the perpetual vibration to which rather makeshift storage on a motor cycle subjects them. Second, it is stupid to expect a light and small accumulator to behave perfectly under the high rates of charging and discharging which motor cycle use demands. No competent electrician would dream of employing such patterns of cell for operating a hooter. But here's the rub: we cannot accommodate accumulators of the bulk and weight which science suggests unless we have a sidecar in which to store them, and a thumping big engine to laugh at the weight of our accessories. This detail problem will hamper the progress of electric lighting on solo machines for some time to come. The system is already efficient on sidecar machines, provided the price is not scamped by including a toy accumulator, but I should not dream of using it for serious long distance solo work at present, except on certain conditions.

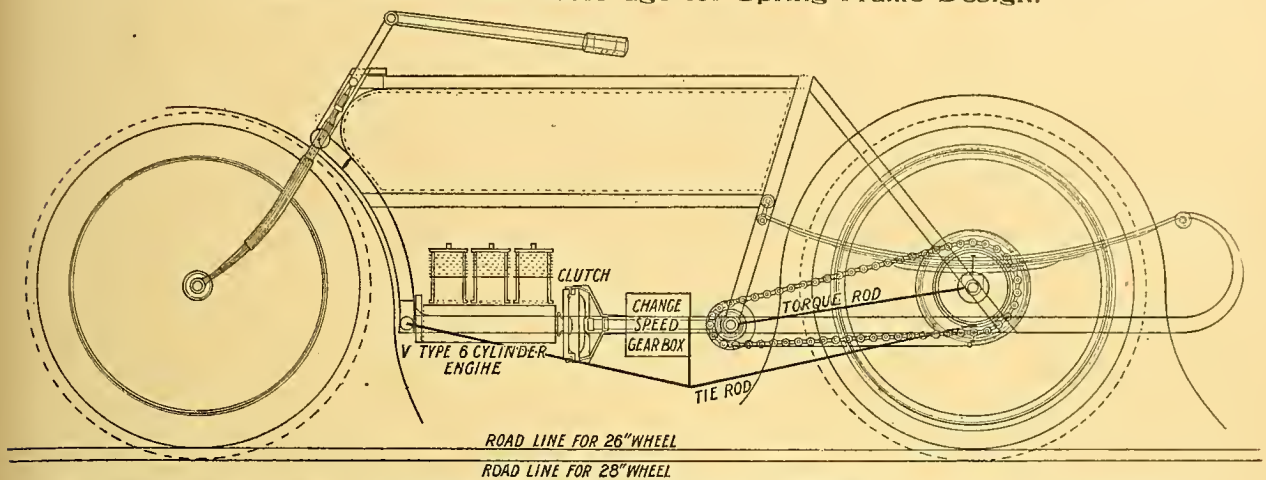
Electric Lighting for Solo Work.

As I state above, the accumulator is the real problem of the solo lighting outfit. I possess second-hand evidence that some accumulators are already equal to the strain, even in the small sizes which alone are storable on a two-wheeler. For example, our contributor "Auriga" used a Fuller Block accumulator throughout last winter, without recharging, and without the aid of a dynamo, and this battery is light and compact; while two of my friends speak very warmly of the behaviour of two foreign accumulators, used with and without dynamos respectively. But some vendors of dynamo sets provide wholly unsatisfactory cells, and it is a costly and awkward matter to substitute cells of higher class, as, for instance, when the standard cells are of an unusual shape, and the carrying case includes the switchboard and springblade connections. If I were marketing a solo set, my first and chief interest would concentrate on the accumulator. I should test every conceivable type, and I would not advertise until I was absolutely satisfied that the cells were up to their work.

["Auriga's" 40 a.h. accumulator was recharged in April last simply as a precaution and stored through the summer: it is now in excellent condition.—ED.]

"The Motor Cycle" and Rear Springing in 1906.

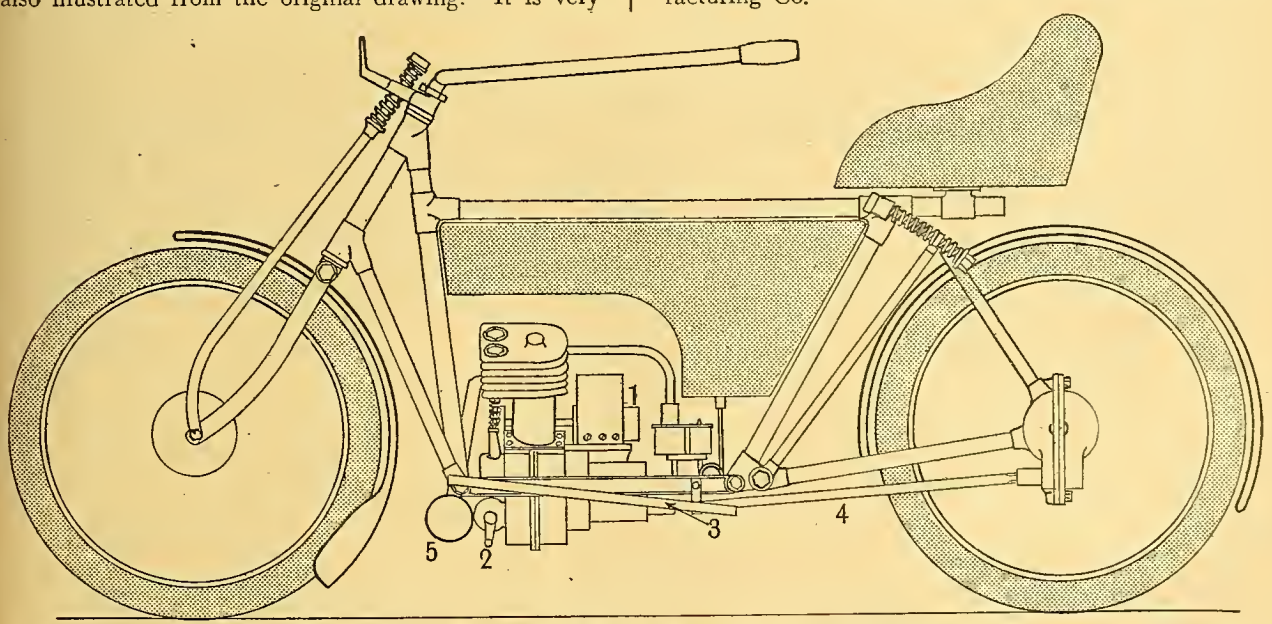
Prizes Awarded Nine Years ago for Spring Frame Design.



The winning design in *The Motor Cycle* Improvement Competition, submitted by Lord Tollemache. It has a 7-8 h.p. six-cylinder V type engine, countershaft gear box, and frame sprung fore and aft.

AS far back as the year 1906, *The Motor Cycle* was, as now, advocating the use of rear springing for motor cycles, and some very interesting designs came to light during a competition known as *The Motor Cycle* Improvement Competition organised by this journal in that year. The designs gaining first, second, and third positions all incorporated a rear springing device of some kind. The winning design, submitted by Lord Tollemache, which is illustrated from the original drawing, contains some very novel ideas. The rear springing is carried out by means of two half-elliptic springs supported at their farthest extremity by a substantial extension of the bicycle frame. This design would hardly conform to modern ideas so well as that gaining third place, also illustrated from the original drawing. It is very interesting to note that this design was submitted by Mr. Alfred Scott, the well-known designer of the famous Scott motor cycle. It is curious that in his letter accompanying the design, Mr. Scott mentions that he does not favour an open frame. Of course, as everyone knows, the present-day Scott is one of the very few machines which are turned out with an open frame as standard. The rear springing device in this design is very simple, the drawing being practically self-explanatory, the rear portion of the frame working on a pivot and supported by two spiral springs beneath the saddle.

The second prize design, submitted by Mr. Pilkington, incorporates the cantilever seat pillar, which was shortly afterwards adopted by the Rex Manufacturing Co.



Design also embodying a spring frame, for which the third prize was awarded to Mr. Alfred Scott, of Leeds. The parts numbered are: (1) Magneto. (2) Starting handle. (3) Footboards. (4) Propeller-shaft. (5) Silencer.

Scottish Officers and their Pleasure Mounts.

JUDGING from the number of officers one sees speeding up and down the valleys in many parts of Scotland, it would seem that the motor cycle is even more popular among men of the Highland and Lowland regiments than it is in the flatter districts of the South. This state of affairs is not surprising when one considers the conditions that prevail in the North. About most of the valleys many beautiful mansions are situated, and the sons of these houses have turned out like men to join regiments of their own district, so that, during the initial part of their training, some of them are within reasonable reach of home, and a motor cycle is all they require to enable them to spend their leisure hours most advantageously. Up or down the valley they go, then, at dusk, returning to the military centres late at night or in the early morning, so that for an hour or so each day their passage along many of the roads resembles a military procession. A finer, tougher set of young fellows it would be hard to find anywhere.

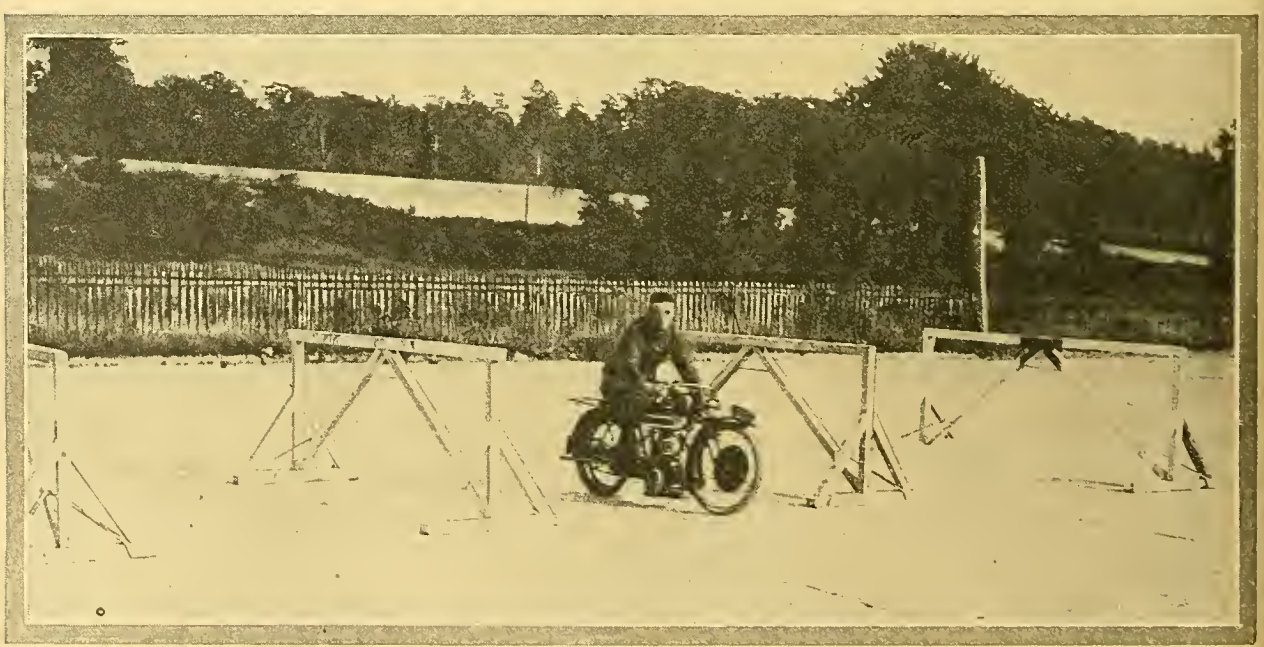
The variety of machines is also very interesting. Not a few light cars are about, but, as in England, the lightweight motor cycle, snapped up at the last moment, predominates in numbers.

That these little machines have proved of immense value in meeting the sudden demand of the last twelve months is obvious everywhere. As officers' mounts they are hard to beat, and many of the men now riding lightweights would be without machines at all were it not for the timely arrival of the little two-stroke. But these men, to-day new to the pastime, will not be content with the diminutive two-stroke after the war, and manufacturers of luxurious touring machines will then have something for which to thank the cheap lightweight of to-day.

But in addition to the little two-stroke, a wonderful variety of old jiggers is to be seen konking at full throttle through many of the Scottish dales during the twilight hours. Now an old Triumph shoots gamely by, followed by the bellowing discharge of an ancient Rudge. A new Lea-Francis brings up the rear, and though it seems to be travelling at half the speed, one notices that it is far ahead when the next corner is reached. A tiny two-stroke splutters round the bend at a good twenty-five; a big twin Indian dribbles behind it at twelve. Then come more old Triumphs, a Scott and a Douglas, and struggling manfully to overtake the whole procession, heedless of revs. and rattles, flies a rusty and very ancient P. and M. Everyone runs his mount full out on each straight bit of going, and, considering the very mixed sample one sees on the road, surprisingly few breakdowns occur.

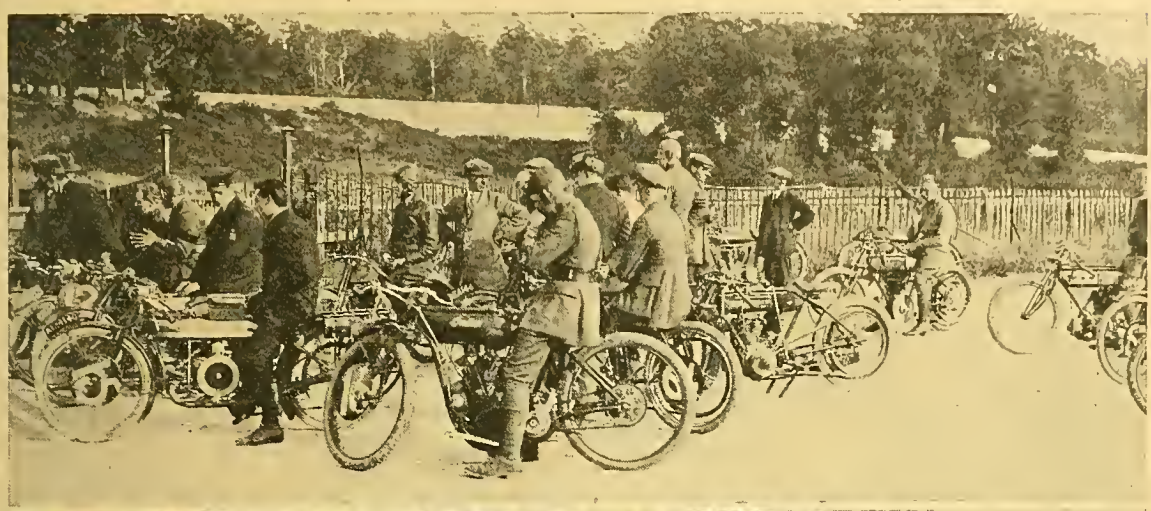
Most of the main roads in Scotland are good and reasonably level, while good fishing or shooting is usually to be obtained within a few miles of the military centres. Thus, even though home be out of reach, the officer of sporting tastes is able to make good use of his mount. As a rule the roads follow the rivers, and at many points machines are to be seen stacked up in the gutters while their owners find a happy relaxation from their military duties in an hour or two with rod and landing net.

Not much shooting is done, since it is impossible to organise parties, but seldom before have the Scottish moors carried such quantities of game as they carry this year. But while an hour at the river side can be occasionally snatched, it requires time to walk up the moorlands, and consequently the same story is told in every valley—game in abundance, but no guns available. As was the case last season, many estate owners are organising scratch parties—the village grocer, cobbler, and poacher—to walk the moors.

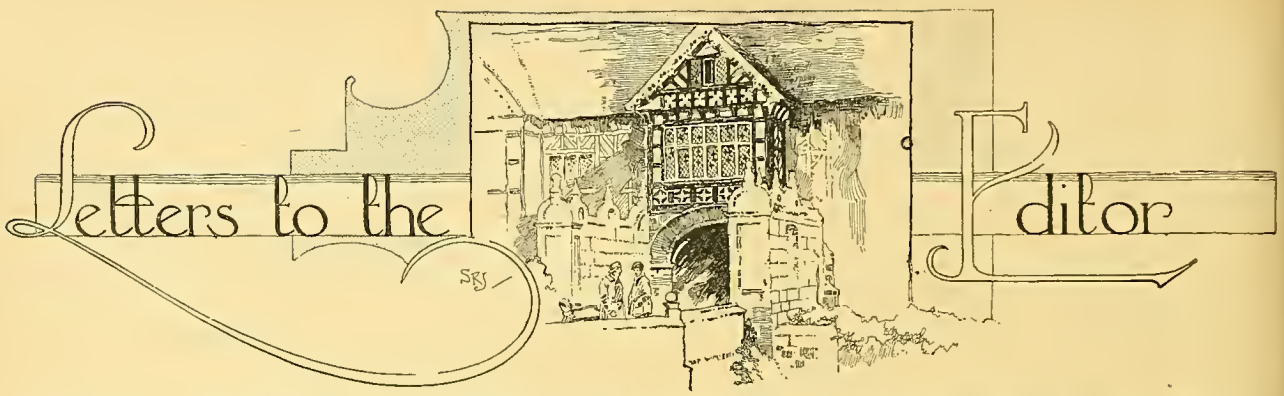


THE ARMY AND NAVY MOTOR CYCLISTS' MEETING AT BROOKLANDS. Sergt. A. Milner, R.E., riding a two-stroke Levis in the Serpentine race.

THREE PHASES OF A BROOKLANDS RACE IN PICTURES.



(1) Lining up for the start. (2) Are you ready? (3) Go!



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Physically Unfit.

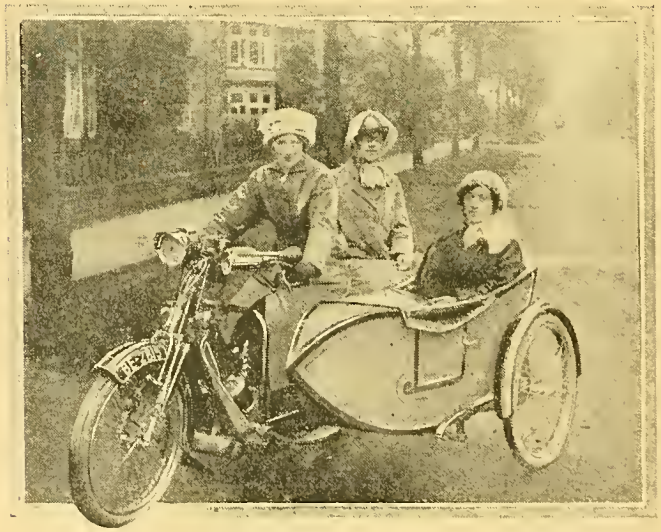
Sir,—I was most interested in the letter by "H.M.B." upon the physically unfit. I myself came home from New Zealand just before the war broke out owing to lung affection, brought on by exposure in the New Zealand bush and on the gum fields; also I have farmed in Canada, worked on the railway there as a navvy, and generally roughed it much more than the average man. Like "H.M.B.," I look well and strong, and have had much to put up with from interfering humbugs; but as I have tried twice for the Army and once to go to Servia with the Red Cross, my conscience is quite clear. NORMAN LAWSON.

Piston Rings.

Sir,—I read with interest your article recently on piston rings. I hardly like the idea of peaning a ring to get spring, as there is a danger of getting out of shape and being off and on at the points. Also in peaning the width is bound to be altered.

Another thing I should like to know is why makers turn rings thick and thin? I find the wear takes place at the thin part, and really not worse at the thick, *i.e.*, vertical wear. No doubt the majority of broken rings are due to vertical wear at the thin part.

My method of making rings is to have the same thickness all around. Turn the ring 1-64th larger than the cylinder cut gap, and fit in. Then spring the ring open to the required spring by means of a piece of strong iron wire, put in the fire, make red hot, and cool out in water. This I have done and found successful, the spring remaining on after cooling out. MOTOR CYCLIST.



The Misses Reeve and their Scott sidecar outfit. In sending the photograph Miss Reeve says: "Perhaps the publication of it will induce other ladies to follow our example. My sisters and I have glorious spins."

Paraffin Lamps.

Sir,—Now that winter is upon us, and the lighting question looms once more in our minds, may I be allowed to advance a plea for the more extended use of paraffin oil? There are those who will unthinkingly accuse me of being out of date, but when the problem comes thoroughly to be considered in view of the present Defence of the Realm regulations, it will be seen that paraffin has claims on the ground of sufficiency, simplicity, and economy.

Sufficiency.—In the pre-war days, when one was allowed to enjoy the fruits of the labour of keeping acetylene generators in order in the shape of a good light, and the expenditure was worth it, acetylene rightly held the entire field, but now, when if one has a good light one is compelled to dim it so that it becomes but a mere rush light, I claim that a paraffin lamp such as taxis use for side lamps is amply sufficient, and no dimming is necessary. The point of simplicity is so self-evident that it is unnecessary to deal with it. Economy.—A halfpenny-worth of oil gives about twelve hours' steady light.

As regards rear lights, I have made a perfectly satisfactory one from a Lucas cycle lamp (Pioneer pattern), to which I have fitted a Barton paraffin burner. I am at present making experiments with a 5in. lens mirror paraffin oil head lamp, and if successful will communicate the results to your readers. V. C. RAYNER.

Mind and Machine.

Sir,—I have read Mr. Vulliamy's letter and your editorial comment on the psychic relation between man and machine with much interest, tinged, I am fain to confess, with a little amusement.

In your comment I venture to think that you have confounded "sympathy" with "skill." A piece of machinery does not possess a soul: nothing does unless it has the power of will. It is conceivable to argue that an animal, even an insect of the lower creation, may possess a soul, but both are possessed of a degree of what the Latins termed "anima," and even if they cannot think or reason, they at least have instinct, which is not very far removed from reason.

But when we come to an inanimate piece of machinery it is obvious that it cannot possess any of these attributes, in that it is entirely dependent on some outside human influence to operate it. Were such a psychic phenomenon, as suggested by your correspondent, possible, it would be feasible to operate a machine by volition alone, without in any way touching the levers. There is no doubt whatever that a motor bicycle will run better with what you term a "sympathetic" driver, but in my opinion the term is a misnomer, the term "skilful" being the real word wanted.

The analogy between the motor cycle and *its* rider and the horse and *his* rider is, I venture to think, unfortunate. The possessive pronoun shows why, for the horse being an animate being can and does possess an actual power of thought transference with a rider to whom he is accustomed, or even to a strange rider whom he recognises as specially "sympathetic" (the right word in this case).

What Mr. Vulliamy practically asks us to accept is the possibility of telepathy between an animate being and an

Safe at any angle.

THE scientifically designed ridge on each side of the dome-shaped tread grips the road the moment your machine heels over. Normally this ridge is off the ground, therefore is never under wear unless the machine is inclined to one side.

This ensures *permanent* protection—in fact, a Bates-built tyre at the end of its life often has more skid resistance in it than many a new tyre of another pattern.

The thick tread of a Bates-built gives a high degree of comfort and security; whilst its ability to stand up to the roughest roads represents true tyre economy.

Bates-built tyres are being supplied to the
British War Office,
South African Defence Force.

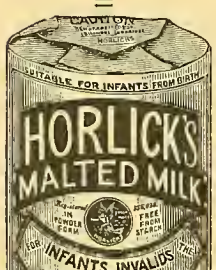
ZENITH MOTORS, LTD.
HAMPTON COURT, ENG.

The Food Drink which promotes fitness and efficiency is

HORLICK'S MALTED MILK



A glass of Horlick's is always the best invigorator. Taken before a ride it will give strength and endurance, and after strenuous exertion there is no better pick-me-up. At all times it gives and maintains fitness and stamina, and is especially useful to men on Active Service.

SUPERIOR TO TEA, COFFEE, COCOA, AND BEEF EXTRACTS.
READY IN A MOMENT WITH HOT OR COLD WATER ONLY. NO COOKING.
Served in Hotels, Cafés, and Railway Refreshment Rooms.

Also available as delicious food tablets to be dissolved in the mouth.
Relieve hunger and thirst and prevent fatigue.

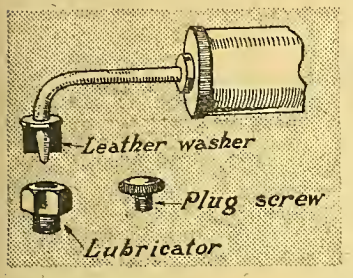
Supplied in Sterilised Glass Bottles, at **1/6, 2/6, 11/-,** by all Chemists and Stores.
The Tablets also in convenient Pocket Flasks at **6d.** and **1/-** each.
Liberal sample sent post free for 3d. in stamps.
HORLICK'S MALTED MILK COMPANY, SLOUGH, BUCKS.

inanimate object; and I have yet to hear of even strange tales from the Orient to confirm such a view. His letter is interesting, as anything putting forward some new thing is interesting to us just as it was to the old Athenians. But the cold light of reason is likely to turn down his contentions.

M.S.

The Lubrication of Spring Forks.

Sir,—I have often been impressed with the lamentable manner in which spring fork spindles are usually lubricated. The lubricators provided are almost always choked with dirt, which seems to delight in congregating at their base, and, in consequence, the oil never reaches its goal.



My own machines are now fitted with lubricators as shown in the sketch; and you will see that if a thick leather washer is fitted to the nozzle of an ordinary oil injector this can be pressed tightly down on to the lubricator and oil forced right along the spindles in a cleanly manner until its appearance at the ends gives ocular proof of its effectiveness.

E. C. FRANK EVANS.

A Long Distance Record—And a Sigh for Spring Frames.

Sir,—Can any reader beat the following? Up to September 1st I have ridden a three-speed 1913 Triumph 40,267 miles, using the machine on practically every day for two years and six months. The machine failed me on two occasions only, once breaking a piston ring and on the second occasion bursting a pulley flange. The cost works out as follows:

Licences, etc.	£2	10	0
Refits and repairs	32	0	7
Fuel	27	16	5
Oil	3	15	9
Cycle oil		10	0
Tyres	30	14	3
Belts	5	14	3
Carbide		9	2
Depreciation	40	0	0
	£143	10	5

Roughly .85d. per mile.

Except for the fact that the three-speed gear is, and has been for a long time, out of action, the machine is running almost as well as when it was new.

Having almost eliminated the item depreciation, my running expenses during the coming winter should not exceed ½d. per mile.

But, oh! for the day when the Triumph Co. introduce a rear sprung motor cycle. My backbone is growing old, and every month pot-holes seem to get deeper.

A. W. TOMLINSON, R.N.

Honister Hause.

Sir,—Whilst on holiday in the Lake District, I attempted and climbed Honister Pass from Buttermere, with sidecar and passenger.

The first attempt was abortive owing to the whole combination slewing round in the loose stuff; only the prompt action of my passenger in jumping out and pulling at the sidecar averted disaster. We returned to the foot of the pass with my friend dragging at the carrier, the machine being almost totally unmanageable owing to the loose surface.

The second attempt was made too cautiously, and the wheel came to rest half-way up. We returned again in the same careful manner, and, leaving the machine, walked half-way up mapping things out.

The third time we had better fortune. The first bad gradient was taken all out—perhaps a doubtful method when so much depends on tyre grip, but success justified it. The bad bend at the top was totally unexpected, even where all things were unforeseen. The sidecar lifted, and in correcting this the front wheel was nearly broadside on, but continued to steer fairly. This I consider inexplicable. The remainder of the hill, although horribly steep and with surface entirely disintegrated, was comparatively easy.

We left Keswick at 2.30 p.m., and crossed the notorious Newlands *en route*. We got back at 5.30, the task accomplished. This, I think, compares very favourably with the performances of two well-known competition riders, who some time ago spent four days before being successful, notwithstanding the fact that they had in spring a road undisturbed for months, whilst we, on September 2nd, found it after a busy season's use. The coaches which ascend the new road *via* the quarry descend the Buttermere side with skidding pans on the wheels, and the passengers have to walk. These skids plough the road surface until it resembles a shingle beach or a river bed.

My machine is a standard touring 6 h.p. Bradbury combination fitted with Wood-Milne tyres. The engine never faltered the last time up, and the way the tyres gripped was truly marvellous. I have no connection with either firm beyond being a very well satisfied customer.

F. WOOD.

Two Sound Machines.

Sir,—I should be glad if you would publish my remarks on two machines I have had—the first and the last—as I feel that too many intending purchasers are put off by people continually stating that these machines are worthless and shake to pieces in a few months.

The two I refer to are the F.N. two-speed single and the 7 h.p. Indian twin. The F.N. I purchased third hand, very battered by rough usage (and a 1911 model, too, which shows that it was rather old). This machine did over 10,000 miles to my knowledge, and pulls better now than when new, owing to the fitting of a B. and B. carburetter. This shows that this machine deserves a pardon from critics who are not in a position to judge. My only trouble was oil occasionally getting on to the platinum points. I wish this had been my worst trouble with some of the more popular mounts, some of which needed rebushing in 1,500 miles.

As for the Indian, it has already outlasted my 6½ h.p. N.S.U., and still I cannot find one particle of wear in this machine. Its reliability is the most remarkable feature about it. This Indian has never yet konked, has never coughed right out, and has never yet failed to start on the fourth stride.

REAR LIGHT.

Birriwa, N.S.W.

A HAPPY TRIO. It is remarkable how canine pets are lovers of motoring. The subject has often been dealt with in the motoring press. Our picture shows an Irish terrier which can find a secure perch on the top of the tank or on the carrier, so long as he can accompany his master. The machine is a twin-cylinder A.I.S.

Double Countershaft Pulleys.

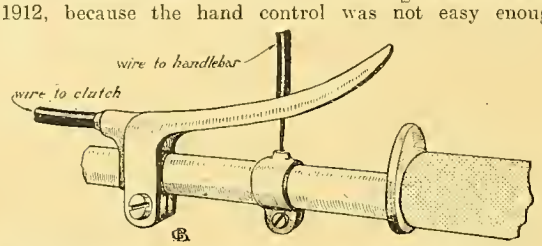
Sir,—Referring to Mr. Wall's letter in *The Motor Cycle* of September 9th *re* double expanding countershaft pulley gear, I have had this identical gear running on my machine for the past three years, and can confirm Mr. Wall's statements in every particular. I find it simple, cheap, and reliable. The ratios are 5 to 1 down to 12 to 1. What more can one expect? I have ridden through miles of mud and snow with never a sign of belt slip. Why the gear is not more widely used I cannot imagine. I should be glad if someone would point out the defect which has consigned several patents to the limbo of forgotten things.

There is a patent in existence, of which I have the name, number, and date, which seems to me to have anticipated Mr. Wall's, unless it is only possible to patent the application of a principle and not the principle itself.

LOUIS DUGDALE.

Double Clutch Control.

Sir,—There is a point in your issue for August 26th which is of much interest. I refer to the hand and foot controlled clutch. I fitted such a control to an engine-shaft clutch in 1912, because the hand control was not easy enough,



and also the movement of one notch in the control freed the clutch. The accompanying sketch explains it all.

One advantage might be mentioned. The handle control could be set so as to give a slight slip with throttle half open when in traffic. Then, if the throttle were half opened at the same time that the foot let in the clutch, the irritating experience of stopping the engine would be avoided.

BA 620.

South Wales and the Wye Valley.

Sir,—I have read with very great interest the account of the trip entitled "Through the Length and Breadth of Wales" in one of your recent issues. The account afforded me peculiar pleasure, because I have been over most of the ground myself, and remember even the vile hills at Fishguard and the pot-holes on the coast road. I know it is not practical in an account, necessarily brief, such as your correspondent gives, to enlarge on the beauties of *all* the ground traversed, but I would wish to draw your readers' attention to a district disposed of in a few words in that account, viz., the run from Llandrindod Wells to Llandovery and Carmarthen. I have had the privilege as well as pleasure of spending a month recently in the centre of that district, motor driving for the Red Cross Society (for such was my way of utilising my holidays for the cause of the wounded), and if the author had only known, and, instead of taking the direct road Llandrindod to Builth, had travelled *via* Rhayader (some thirteen miles longer), he could have included the wonderful waterworks at the latter place that supply Birmingham, as well as travelling through the magnificent scenery of the Wye Valley. Then, again, having left Builth about eight miles, if he had taken the road to the left—to Llangammarch Wells—instead of what is considered the direct run to Llandovery (a difference of only a mile or two), he would have obtained an extremely interesting view of the Irvon Valley and Llanwrtyd Wells from the southern road, which is more elevated than that on the north of the river. The country about there is full of bold mountain scenery, with soft-hued valleys alternating, and I am sure it is through ignorance of the splendid variety of the landscape that the district is not more largely patronised by motorists of all kinds. Llangammarch Wells, for example, is a fine spot to take as a centre, being equidistant from a number of "crack" views and places of interest, from the above-mentioned Wye Valley scenery on the north to the unexcelled view from the summit of the Sugar-loaf on the south. There are many "trips" in the neighbourhood very popular with those who know them, and one of the finest, as well as the most exciting from the motorist's point of view, is the circular run of twenty-three miles Llangammarch, Garth, Abergwessin, Llanwrtyd Wells, Llangammarch, which nobody who visits the locality, own he either a 40 h.p. limousine or a 3½ h.p. motor cycle, would dream of missing. The place is rich in good hotels—it is the only barium water district this side of Germany, I believe—from the big hotels a mile up the Lake Road to the Cammarch, on the main road, and very central for tours. A few of the gradients are a bit stiff, but that is a common failing of mountainous districts. I would commend the district to your readers. AN IRISH HEADMASTER.

Belfast.

A Curious Short.

Sir,—As a despatch rider at the Front, I eagerly look forward to *The Motor Cycle*, which is sent to me every week, as many a pleasant hour is spent reading and discussing the contents. I assure you I appreciate your valuable journal very much out here. I did so at home, but I do so even more now.

Perhaps, for the benefit of other readers, I might be allowed to explain a curious trouble I had with a Douglas lately. This certain machine (as is often the case with the Douglas) had a glazed waterproof mud shield, which is stretched down just behind the front mudguard. The fault was a persistent misfiring in the front cylinder at anything over about 15 m.p.h., either on high or low gear. The engine fired all right in both cylinders when on the stand at any speed, also on the road under about 15 m.p.h., either high or low gear. Everything was tried and looked over—contact breaker, and commutator of the magneto, h.t. cable, valves, and several plugs tried, but in vain: the misfiring still continued when over the said speed. I may say the machine was tried on the stand in a dark room, but no leakage of current was visible, and the engine fired quite evenly on both cylinders at any speed.

One night I had to go with a despatch, and at last found the root of the trouble. When going over about 15 m.p.h. the wind bulged the mud shield inwards till it touched the terminal end of the plug of the front cylinder, and so short-circuited the current. When slowing down the shield went back to its normal position, clear of the plug. The plugs had no waterproof terminals fitted. The fault, of course, was the mud shield not being adjusted tightly enough.

I have cured many a fault on a motor cycle, but I thought this was the limit, and that it would interest some of the readers of your valuable paper.

G. A. SEMPLE, Lance-Corpl. A.S.C., M.T.,
Despatch Rider, B.E.F.

Motor Cycle Volunteers.

Sir,—I should like to inform N. Randolph that Lieut. M.B. did attend the first khaki meeting at Brooklands, and, instead of weeping, he competed, thereby spending a very enjoyable afternoon.

Two of the foremost arguments brought forward by the supporters of this movement seem to settle the question:

(1.) All members must sign a statement that they are ineligible for military service.

(2.) Numbers of men who received their preliminary training in some M.V.C. have since enlisted or have received commissions.

These two statements are by no means consistent. In conclusion, may I remind N. Randolph, with all courtesy and quite impersonally, that Lord Kitchener has called for another 300,000 men. ALEXANDER LINDSAY.

SUMMARY OF CORRESPONDENCE.

A Loan of Petrol.—Will the driver of a 6 h.p. Bradbury sc., who lent two gallons of petrol to the rider of a Douglas on August 22nd, send his name and address to R. G. Clarke, 130, Brownside Road, Cambuslang?

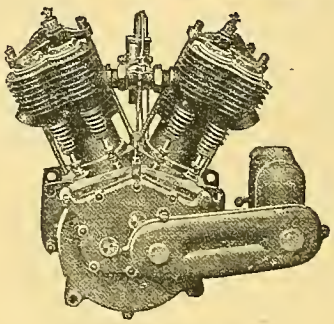
A·J·S

FEATURES



The A.J.S. 6 h.p. Engine.

The Engine of the A.J.S.

is the outcome of 16 years' high-class experience in the design and manufacture of internal combustion engines, and is distinguished for SILENCE, POWER, FLEXIBILITY, and ABSENCE OF VIBRATION — features which are the direct result of the A.J.S. policy of close and studied attention to the question of detail.

In the A.J.S. Engine the usual noise arising from Valves, Timing Gear and Transmission are entirely absent, the Exhaust is wonderfully silent, and the whole unit, in design and build, so near to perfection as to result in the A.J.S. machine being PRACTICALLY INAUDIBLE when travelling under ordinary conditions.

The Cylinders are of a design which ensure the merit of EVEN COOLING — a point in which the A.J.S. has always been pre-eminent — and which also permit of their quick and handy removal when necessary.

Before passing into the Erecting Shop every A.J.S. Engine is submitted to a thorough running test under its own power, having to reach and maintain a Standard of Efficiency, far in excess of the nominal rating, and before leaving the Works, every complete A.J.S. machine receives a thorough, searching Road Test at the hands of Expert Testers.

Now ask for copy of Catalogue describing all A.J.S. models.

Cork Club's Hill-climb.

(1) W. J. O'Connell passing the starting line on his 2¾ h.p. Douglas.

(2) Sergeant Hughes, R.E., at full speed on his 4 h.p. Triumph. Hughes won the Two-stroke Military Class on a Levis.

THE Cork and District Motor Cycle Club held the penultimate event of its competitive season on Wednesday last week, when a series of hill-climbing competitions were held on a hill near the city, on the road leading from the Lough to Ballinhassig. The number of events held during the summer has not been as large as usual, owing to the absence of so many members of the club on active service, but a number of those who are still in training were able to take part in last week's trial. There was a special class for single-cylindered two-stroke machines confined to members of the Forces, and this was won by Sergt. Hughes, who made a very good climb on the 2 h.p. Levis on which, earlier in the afternoon, Fitzgerald had made the fastest climb in the under 300 c.c. class. The length of the hill was about half a mile, and as the steepest portion of it did not exceed 1 in 8 there was little opportunity for the use of variable gears. The fastest time of the day was made by C. B. Franklin, the well-known Indian rider, who covered the distance, with a flying start, in 38s. on a 3½ h.p. single-cylindered machine. The hon. secretary, R. S. Russell (2¾ h.p. Douglas), made the best time in the under 350 c.c. class, and, like Franklin, he, too, won the class on *The Motor Cycle* formula.

The results on formula were as follow :

UNDER 300 C.C. CLASS.—1, M. J. Fitzgerald (2 Levis), time 56⅖s.; 2, J. Gibbins (2 Triumph), 72⅖s.; 3, Staff Sergt. B. Pangbourne (2 Levis), 79⅕s.

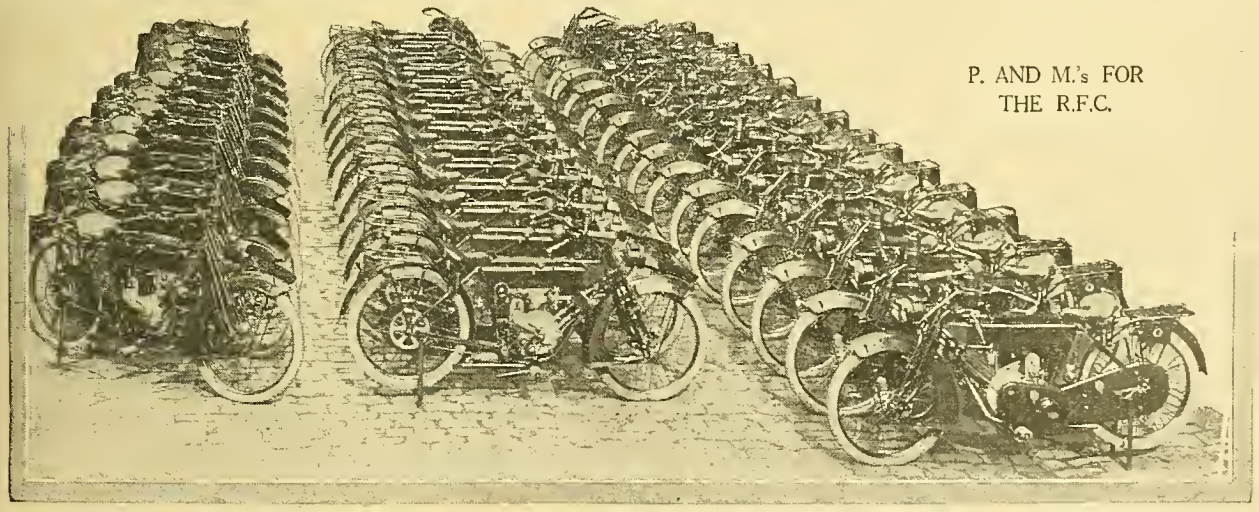
UNDER 350 C.C. CLASS.—1, R. S. Russell (2¾ Douglas), time 42s.; 2, D. Lucy (2¾ Douglas), 52⅕s.; 3, M. English (2¾ Douglas), 57⅕s.

UNDER 600 C.C. CLASS.—1, C. B. Franklin (3½ Indian), time 38s.; 2, E. G. Jack (3½ Rover), 46⅕s.; 3, R. Swanton (3½ Indian), 51s.

TWO-STROKE CLASS (confined to military men).—1, Sergt. B. Hughes, R.E. (2 Levis), time 57⅕s.; 2, Corpl. E. B. Russell (3½ Triumph), 66⅖s.; 3, Staff Sergt. B. Pangbourne, R.E. (2 Levis), 71s.

CAR CLASS.—1, Lieut. Pike (D.F.P.); 2, W. J. Callaghan (Humber); 3, M. English (Humber).

The result of the hill-climb places R. S. Russell at the head of the aggregate competition for the shield presented by Mr. M. English for the rider scoring the greatest number of marks in the season's competitions. Up to Wednesday week, Dooley was leading. The reliability trial for the Pike Cup will decide the destination of the shield.



P. AND M.'s FOR THE R.F.C.

One week's delivery for the military wing of the Royal Flying Corps. A batch of over forty P. and M. motor cycles fitted out complete with lamp, horn, and Kempshall tyres. They are of dull finish, with the exception of crank case and sundry parts. It may be added that the R.F.C. already have over five hundred P. and M.'s in use.

Motor Cycle Exports and Imports.

Government Machines not Included in Board of Trade Returns.

THE American motor cycle industry is awake to the opportunities with which the war has provided it. On August 19th last the *Motor Cycle Illustrated* of New York published a leader emphasising the fact that Germany, France, and England will do about £2,400,000 less trade in motor cycles, ordinary bicycles, and parts with foreign countries than they did in 1914. In 1914 the war prevented these exports showing their usual increase, and the actual shrinkage in such exports must be contrasted rather with the natural rise which 1915 would have brought in normal times than with the figures for 1914 or 1913. The American Government departments inform our contemporary that the fall in British motor cycle and cycle exports alone will be more than 50% as compared with 1914, a fall which probably represents an actual shrinkage of at least 75% on the sum which would have been realised in times of peace.

The exact situation is a little difficult to analyse. The Board of Trade returns for August, 1915, show that we exported motor cycles and parts to the value of £79,866 during last month, and imported machines and parts to the value of £38,582. On the surface these figures indicate that, despite shrinkage of exports in this line, we still rank as a "creditor" nation, and not as a "debtor" nation in this sphere of industry. But in view of the fact that our factories are so largely engaged on munition contracts, it is difficult to believe that we are exporting more machines for civilian purposes than we are importing. An observer would be tempted to suppose that the £79,866 exports include all machines bought by the War Office and Admiralty for war purposes, and possibly all the machines supplied to Allied Governments as well. Against this *The Motor Cycle* has ascertained definitely from the Board of Trade that machines bought by the Government and transported in Government ships do not figure in the Board of Trade returns. Motor cycles bought by the Russian Government are shown in our returns, and, incidentally, there has been a weekly supply going to our Ally for some time past. It is, therefore, possible that our actual exports of motor cycles and parts, for purely civilian purposes, still exceed our imports for the same ends.

However, these facts do not affect the patriotic contention. Even supposing that our motor cycle exports still show a slight cash balance in favour of this country over our motor cycle imports, there are many spheres in which the imports vastly exceed the exports, and in which this nation is, for the moment, a debtor nation, and is falling more and more deeply into debt; the adverse balance is bound to increase so long as the war lasts, and we are compelled to avail ourselves of America's offices.

The wording of the explanation mentioned above is contained in the following official communication from Whitehall:

[COPY.]

From the Assistant Secretary of the Board of Trade.

The Editor, *The Motor Cycle*,
Hertford Street, Coventry.

Sir,—With further reference to your letter (G.S./E.M.W.) respecting the figures given in the "Monthly Accounts relating to Trade and Navigation of the United Kingdom" for the exports of motor cycles during the war, I am directed by the Board of Trade to state that they now understand from the Custom House that all motor cycles shipped to foreign countries for warlike purposes are included in the Trade Returns of the United Kingdom, unless taken from British Government Stores, *i.e.*, unless they have been bought by the Government in this country and are exported on Government ships. Of the exports of such motor cycles no records are kept.

I am, sir, your obedient servant,

(Signed) H. FOUNTAIN.

A Lancashire Road Puzzle.

WILL any reader who has lately traversed both the direct Warrington-Wigan-Preston route and also the R.A.C. avoiding route *via* Ormskirk and Rainhill give us his opinion as to which is the more desirable? Last month we tried both routes—the tramline section on the advice of an intelligent Warrington policeman—and found that our experience bore out his opinion, viz., that the improvement effected to the road surface of late now renders it the more desirable route of the two—though neither is pleasant. If both routes were equal in length, then the balance would be in favour of the avoiding route, but a road must be bad to necessitate forty miles being covered in preference to thirty when time is an object.

Again, the so-called avoiding route is very badly signposted, though it is supposed to be clearly marked throughout by the R.A.C. Friends have confirmed our experience that it is not possible for a stranger to travel over this section without stops to make enquiry, and the Lancashire labouring classes do not seem to know the best way to the next town.

We wonder if the R.A.C. is alive to the fact that Tarmac is not now unknown in the Warrington-Wigan stretch. At any rate if a representative could be spared to try both sections again, measuring each accurately and subsequently giving his report, the R.A.C. would confer a benefit on thousands of motorists who have perforce to use this badly cut up route to the north with its maze of tramlines and cobblestones.

MOTOR MACHINE GUN BATTERY'S MASCOT.

The 10th battery of the M.M.G. Service in the trenches in Flanders has a mascot, a Flemish dog, and Gunner Hoult, of the Woolwich Club, relates how it has just been "decorated" with a tricolour bow from a tuck box, a gift from Mrs. Hardee. This battery has been in the trenches for several weeks. A photograph of a section of the battery to which Gunner Hoult is attached appears on the next page.

"THE MOTOR CYCLE" RECRUITING SECTION.

Vacancies in the Royal Flying Corps and Royal Engineers' Signal Section.

THE following are among the latest recruits accepted for the Motor Machine Gun Service by the Editor of *The Motor Cycle:*

H. F. Birchall	S. Hilhouse	H. Neville
H. Bird	L. A. Hogg	W. H. Probert
P. Bolger	A. Holroyd	A. Pullen (Johannesburg)
G. Burke	W. Howard	P. Robinson
G. Evans	H. Ingham	E. Sampson
P. Hardy	A. E. Jackson	F. Walker
A. G. Head	E. G. Maynard	I. Williams

Recruiting for motor cyclists has ceased temporarily for the M.M.G.S., the motor cyclists above-named being men who have passed through the Excelsior Training School. A few more expert cyclists of good physique can be accepted for the training school.

Ernest Smith, of Birmingham, maker of the Regal motor cycle, has closed down the works and enlisted in the M.M.G.S. as a mechanic.

All car drivers and artificer-mechanics enlisting in the Army Service Corps are now put through a practical and theoretical test at Grove Park before being finally approved.

Experienced car drivers and motor cycle mechanics are wanted for the M.M.G.S. Pay, 6s. per day. Applicants should mention age, height, and experience, and enclose two original references from previous employers.

Royal Engineer Despatch Riders.

A call for motor cyclists has been issued by the Royal Engineers, which has absorbed most of the names on the waiting lists of the different Motor Cyclist Reserve Committees appointed by the War Office. Furthermore, we are advised that the West Lancashire Divisional Area, the North Midland Divisional Area, and the South Midland Divisional Area have received notification from the authorities that a number of motor cyclists will be required monthly until further notice. This is good news, as, in the past, motor cyclists have had to be content to have their names on the waiting list for many weeks after being passed before being called up. A great many, indeed, got so tired of waiting that they subsequently joined other branches of the Service which required recruits immediately.

A prospective despatch rider must give a demonstration of riding, and undergo an examination of his knowledge of the machine and his ability to put in order any derangement. To carry out this examination, experienced motor cyclists in different centres were appointed as Inspecting Officers by the Government.

A section of the 10th Motor Machine Gun Battery in the trenches in Flanders. Gunner Hoult, of the Woolwich Club, is at the extreme right.

The secretary of the Motor Cyclist Reserve Committee in the West Lancashire Divisional Area is Mr. S. W. Phillpott, 60, Lime Street, Liverpool, and he invites motor cyclists in his district to make personal application to him for positions as despatch riders; they should attend with their machines.

Recruits in the North Midland Divisional Area should apply to Mr. W. H. Bishop, Inspecting Officer, Bolton Road, Wednesfield, near Wolverhampton.

Motor cyclists in the South Midland Divisional Area should write to Mr. Geoffrey Smith, Editor, *The Motor Cycle*, Hertford Street, Coventry, for particulars of the service and also an appointment.

It will save needless correspondence if we mention that transfers to the R.E. cannot be arranged, and the following general particulars apply:

Applicants must be experienced motor cyclists; age, 19 to 38; pay, 2s. 6d. per day, plus 6d. after completion of training, all recruits being made corporals on attestation. Enlistment for duration of war. The minimum height is 5ft. 3in.

Vacancies in the Royal Flying Corps.

It will interest those readers who have applied at various times respecting positions in the Royal Flying Corps to hear that the R.F.C. is now open to take a certain number of motor cyclists for despatch work. The men accepted must have a good practical knowledge of the running and upkeep of their machines, and before being finally accepted will require to pass a test both in riding and mechanical knowledge. The rate of pay is 2s. per day as second-class air mechanics, with enlistment for four years in the Army and four years in the reserve, or for duration of war only.

Applicants should first fill in the form printed below.

Application to join the .....

Name .....

Address .....

.....

Age ..... *Height* .....

Chest measurement .....

How long have you been a motor cyclist? .....

Can you do running repairs? .....

Have you had any previous military training, and, if so, when? .....

.....

Are you medically fit? .....

Occupation .....

When free? .....

A Lady's Record Ride in Lakeland.

The First Sidecar Crossing of Southern Lakeland from East to West.

By GEORGE D. ABRAHAM,
Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc.

At Cockley Beck Bridge, between the passes of Wrynose and Hardknott. The road is seen curling up the latter pass.

OVER the worst hills in England with a lady driver! The words sound adventurous, and anyone who crosses the Passes of Wrynose and Hardknott by motor is not likely to forget the outing whatever the sex of the expert in charge. If the weather conditions be those of the present season, which has been damp to say the least of it, the excitements of the expedition may be excessive.

Thus when Mrs. Mary Riley brought her Enfield sidecar along, and, pointing to the sturdy "two-year-old," said to the writer, "Can we manage it?" the answer was not encouraging. One remembered famous experts and their futile efforts to climb Wrynose Pass. Only one made a clean ascent. This was a few months before the English Six Day Trials in Lakeland, and the later history of the passes, as learnt from the farmers who live "on the spot," is soon told. Despite innumerable attempts, either three or four cars only had crossed the passes, and about six motor bicycles had also succeeded. About eighteen months ago Frank Smith on his Clyno brought the writer from west to east in perfect weather conditions, and after descending the upper part of Wrynose towards Fell Foot Farm, the return journey was made to Eskdale the same day.

Our chances did not look hopeful. However, recent improvements in machines, as well as in the experience and skill of drivers, made one loth to pour cold water on the lady's good intentions. A cloud burst on Wrynose did that more effectively when the auspicious day arrived. This was one of cloud and sunshine as we set forth for Southern Lakeland, with an experienced pillion rider as ballast and a heavy camera outfit as probably the most important passenger of all. The busy main trunk road to Ambleside was followed. Though lady drivers and riders were much in evidence, this was almost the only sign of wartime in the district which has proved so popular in these stirring times. Innumerable war workers and fighters have enjoyed for a brief time the peace of the eternal hills.

At Ambleside we chose the quickest and best way to the foot of Wrynose, and this enabled us to avoid the unpleasantness of overtaking the crowd of morning coaches which set out daily for Little Langdale by the usual route, and thread the narrow roads. Our

way lay first to Elterwater, with the Langdale Pikes looming grandly ahead. Shortly after crossing the bridge beyond the little village we turned sharply and steeply to the right. The writer's warning cry of "bottom gear" enabled the steep and immediate ascent of Owlet Hill to be made in lively style. This capital mile-long hill of good surface has distinct merits as a new test climb, which fact will doubtless be recognised in future trials. From its crest, high up amongst the bracken and rocks, there was a wonderful peep of Wrynose Gap ahead.

Cumberland Humour.

Heavy masses of grey vapour rolled across the grim mountain barrier in front, and for a few minutes of clearness a thin line, like a curly grey silken thread, was seen winding up to the only gap in the scattered crags. It was an impressive sight, but one which did not daunt our driver. At Fell Foot Farm, where the real struggle of the day began, we had a homely greeting. "Queer mak' o' men to trust your lives to that!" said the old dalesman, pointing to the lady and the machine. The writer reminded him of the Cumbrian saying, "Good stuff laps up in laal bundles!" But this did not suffice, and we swung outwards from Fell Foot remembering the farm folk's parting shot, "Th' kettle will be boiling when ye come back!"

At the outset it was easy work. The road, once so thronged with through traffic but now neglected, was grass-grown and stony. It rose gradually to an awkward turfy turn of considerable steepness. This has proved the limit of many a motor's endeavours, and an ominous hole in the wall below showed where not long ago a motor car had come off second best. We almost repeated the same performance. There was assurance in the gripping powers of the new Palmer rubber-studded tyre, and the driver decided to trust more to speed, despite the advice of the pillion passenger, who was now far below having elected to walk up the Pass.

Just on the "hairpin" bend the driving wheel failed to grip on the steep wet turf—the brake-locked wheel was useless, and we slid bodily backwards straight for the wall. The writer made a record exit from the sidecar. Then by instant aid of a sturdy push and the presence of mind of the driver, who steered the driving wheel on to some stony surface, the situation was saved as well as a repair bill for the stone wall.

Local Road Repairing.

At the second attempt this difficult spot was overcome by taking the slippery corner at lower speed and more widely, thus finding a hold on the less turfy middle part of the roadway. A rainstorm chased us up the next half-mile of easier ascent, and with three aboard the Enfield climbed splendidly and steadily. We had heard at Fell Foot that local talent was somewhat proud of recent road repairs on Wrynose. The writer has learned from previous experience to beware of so-called repairs to mountain ways. On this occasion it seemed that considerable portions of the boggy fellside had been planted on the road, and the Enfield plunged into the yielding mass viciously. There was much "mud-slinging" both by machine and riders, but fortunately the road repairers were not within earshot, or they might in future mend their ways. This was the only involuntary halt in what would otherwise, at the second attempt, have been a non-stop climb up Wrynose Pass.

After a safe restart, which the soft-gripping Enfield clutch made easily possible, the upper half of the Pass was climbed. The writer watched the performance from the safety of *terra firma*. It was certainly a thrilling sight, and one did not envy the position of the pillion rider, who seemed to spend most of his time bouncing in mid-air. The so-called surface was composed of jutting rocks, loose yielding stones mixed with turf, and 1 in 4 was the prevailing gradient. Jumping, sliding, squirming, and to the accompaniment of a lusty roar, the machine fought its way upward under the delicate control of its driver. It was a vivid demonstration that skill rather than strength is the main factor of freak hill work of the most extreme variety. Up and up into the gap over the final most difficult section the only visible fragment of life and movement in the grim mountain fastnesses threaded its perilous way. Finally, after growing smaller and smaller, it disappeared from sight through Wrynose Gap, and peace dwelt once more in the lonely heights.

STONE DENOTING BOUNDARY OF THREE COUNTIES.

One of the most remarkable topographical curiosities in the country—the Three Shire Stone on the top of Wrynose Pass (1,270 feet above sea level). It marks the spot where the three counties of Lancashire, Cumberland, and Westmorland join.

A Lady's Record Ride in Lakeland.—

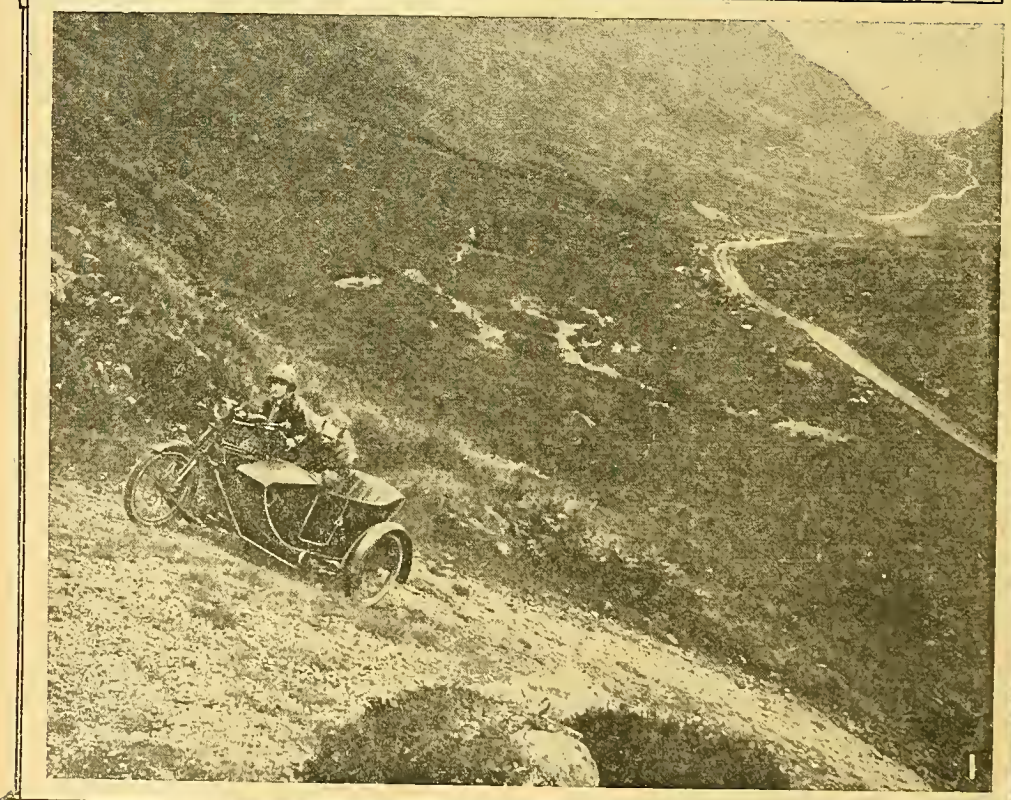
Then the writer joined the others, the camera did its work, and we followed the upper reaches to the crest of the pass, 1,270 feet above sea-level. There one of the most remarkable topographical curiosities in the country was inspected in the shape of the Three Shire Stone. It marks the spot where the counties of Lancashire, Westmorland, and Cumberland join. The grey granite obelisk, standing high and lonely amongst the wilds, was remembered as an emblem of dissension so far as the three counties are concerned in the new road scheme which has been delayed so long. Years have passed and they have failed to apportion their responsibility for the various sections. But the need of a good road from east to west across the screen of lakeland mountains cannot be neglected much longer. Of late months military reasons have demanded it, and those of us who have searched for hidden aeroplane bases in the inaccessible south-westerly area specially realise its importance. Then, mostly on a mass of sliding stones, we slid slowly and carefully down into the cloud-filled depths on the west side of Wrynose. Through a surfeit of moisture from rain and water splashes Cockley Beck Farm was safely reached.

The Ascent of Hardknott.

There was no rest at this out-of-the-world spot, about midway between the two passes, for Hardknott had still to be conquered. Unlike the ascent of Wrynose, which, except for the one initial grassy corner, was singularly straight, that of Hardknott was remarkable for its succession of "hairpins." There were thirteen of these problems to negotiate, and a sudden, double left and right series at the start proved only slightly less difficult than one grassy turn about halfway up the climb.

There were some thrilling moments on the lower section. During an unpleasant skid the prospect of flight through mid-air into the rugged depths of the torrent-filled gorge on the left seemed to startle the lady driver. A splendid recovery was made and, except for a momentary sliding delay on the halfway grassy hairpin, the climb was made non-stop throughout. Under the wet conditions this was a unique performance, especially as no rope or chain was used on the driving wheel. The rubber-studded Palmer tyre was largely responsible for success, and the excellent slow-running of the J.A.P. engine, the whiles it developed great power, made the need for extra gears rather less apparent. It was rumoured that the Enfield makers may shortly add two more speeds to their present standard, and in these days, when sidecar outfits go everywhere, the addition would demonstrably be an advantage.

On the crest of Hardknott the clouds were wafted aside like a huge white curtain, and we looked down the beautiful valley of Eskdale to the sea, 1,290 feet below. From the gloom of grey and purple crags, the way



(1) The first lady sidecar driver tackling the lower hairpin on Hardknott Pass. Wrynose Gap, with the road curling from its crest, is seen in the background.

(2) Climbing the first grassy corner at the foot of Wrynose Pass.

dipped over into the sunny depths on gradients of brake-trying steepness. On the most trying bit of 1 in $2\frac{7}{8}$ the scenery was glorious; but it looked better when seen from the mountain side than from a seat in the sidecar. Those upper zigzags on the Eskdale side of Hardknott Pass must be considered the most trying part of the crossing of the two passes in either direction.

The Roman Camp above Eskdale.

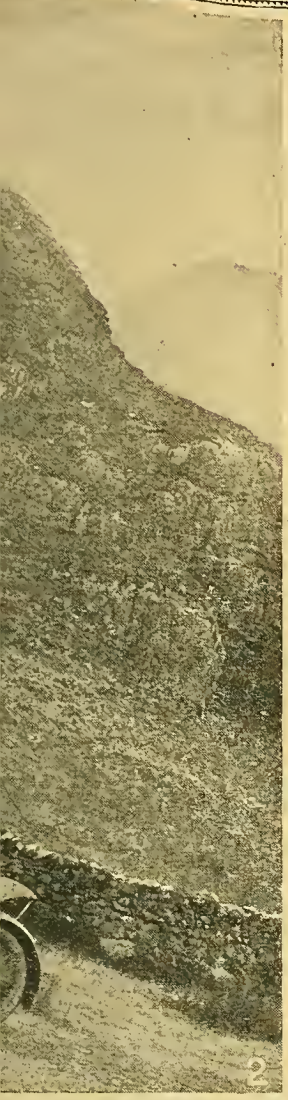
Halfway down the descent, upon the right-hand side and on the more level section, a call was made at the Roman Camp, which is one of the most remarkable in Britain. The remains of the wayside inn and shrine were noticed. The great fort and its many buildings which stand at a slightly higher level were also of interest in these modern warlike times. It was impressive to stand by the old look-out fort which commanded the seaward approach by road and the narrow gap of Hardknott through which the savage Brigantes hurled their attacks. Afar off lay the sea and the golden sands, where the bricks were made that built the now ruined and storm-swept structures. All seemed at peace. Yet as we stood amongst the bracken there came a dull roar echoing in the vast solitudes of Scawfell. Great guns spake the voice of war from the testing grounds.

The lower part of Hardknott Pass, though steep and curly, was remarkable more for its sylvan prettiness. On the steepest part, where

A Lady's Record Ride in Lakeland.—

so many motor adventurers have ended their upward attempt, the retaining wall had again been repaired. Not so long ago it was carried away by a large car which, by good fortune, failed to reach farther than the edge of the gorge in its backward slide. With the aid of ropes the local farmers rescued the wanderer from this perilous position. Once amongst the larches the surface improved, and soon we were speeding down Eskdale to civilisation at the Wool Pack Inn. This altogether delightful resting-place was found to be under new management, and to all motorists who explore Western Lakeland it will prove a veritable oasis in the wilds. The temptation to linger after a sumptuous meal was resisted, and with the glory of the setting sun lighting the seaward prospect, we hurried northwards by the coast road through Gosforth and Egremont. Loweswater, Lorton, and Whinlatter Pass gave the quickest return to the starting point.

Thus, despite adverse weather conditions, what is probably the most severe road test in the country had been carried out successfully. The perfect running of the Enfield outfit—there had never been a moment's faltering—was only matched by the skill of the driver. Now that a lady has shown the feasibility of motoring over the much neglected passes, surely they will be included in the next official trials in Lakeland. Mere man can scarcely refuse the challenge!



(3) Descending Hardknott, amongst the craggy wilds of Eskdale.

(4) Up into the Gap of Wrynose. The roughness of the road and the wildness of the scenery are well shown. Mrs. Riley is seen approaching the summit on her 6 h.p. Enfield sidecar

Amuseful Hints!

An Irish reader writes: "I enjoyed the 'Useful Hints and Tips' in last week's issue, and hope to see this feature continued. By the way, should not the article have been called 'Amuseful Hints,' etc.?"

Adjustable Lamps.

The seizing of an adjustable motor cycle lamp at Woburn, as already mentioned in our columns, had its sequel on Friday last, when the owner was fined £1 and the lamp confiscated. The magistrates informed the unfortunate motor cyclist that they could have confiscated the whole vehicle, a motor cycle and sidecar.

Racing at Portmarnock.

The programme of the last race meeting of the season at Portmarnock on Saturday last was made up of a trio of events. The sidecar event was the least supported, but it was rather a scratch entry, and making a good handicap with so many unknown quantities proved a difficult task. A similar remark also applies to the veterans' handicap, in which Dr. Shiel's L.M.C. was so much faster than the machines to which he was asked to give starts that he was leading at half distance, and won much more easily than the eleven seconds that divided him from the second man would suggest. A Harley-Davidson sidecar was successful in the passenger class; but Walshe, who was second on a B.S.A., would have been the winner had he not had the misfortune to unship his passenger in going over a water gulley.

T. E. Green had not been seen in any Irish competitions during the season, as he is now serving with the Mechanical Transport Section. He was having a few days' leave in Dublin, and borrowed an old Rudge, but apparently he spent little time in tuning it up.

The results were as follow:

FOUR MILES VETERANS' HANDICAP.

	Time.
1. Dr. Shiel (3½ L.M.C.), scratch ..	5m. 54s.
2. R. P. Hurse (4¼ B.S.A.), scratch ..	6m. 5s.

TEN MILES SCRATCH RACE (under 600 c.c.)

1. C. B. Franklin (3¼ Indian) ..	13m. 39s.
2. T. E. Greene (3½ Rudge)	14m. 29s.

SIX MILES SIDECAR HANDICAP.

1. H., "Davidson" (7-9 Harley Davidson), scratch	9m. 6s.
2. R. Walshe (4¼ B.S.A.), 30s. ..	9m. 43s.

National Relief Funds.

At the week-end the principal relief funds stood as follow:

	£	s.	d.
The Queen's Work for Women Fund ...	164,524	3	5
The Weekly Dispatch Tobacco Fund ...	83,076	2	6
"France's Day" Collection	21,843	2	0
Belgian Relief Fund (exceeds)	860,000	0	0
The Times Fund for Sick and Wounded	1,668,236	16	10

Imports and Exports of Motor Cycles.

As was only to be expected, the trade of this country decreased enormously at the outbreak of war, and the export value of motor cycles and parts dropped from £125,860 in July, 1914, to £77,121 in August, 1914. The motor cycle trade suffered not only from the general depression, but also from the fact that many hundreds of motor cycles were taken over for war purposes by the Allied Government, and also because the manufacturers have been engaged to a large extent upon the manufacture of munitions. Now that the Board of Trade returns have been issued for August, we are able to compare a month's trade with the same month under war conditions, and we find that there is a welcome increase in the value of exported motor cycles and parts of £2,745, although the actual number of motor cycles exported has dropped from 1,324 to 1,092.

Compared with last year the imports have, of course, increased to a very large extent, the number of motor cycles being 645 last month, compared with 97 for the corresponding month of last year; but the total number of machines and parts, while approximately four times that of last year, is only about double the 1913 figure. The figures are as follow:

IMPORT VALUE OF MOTOR CYCLES AND PARTS.—August, 1915, £38,582; August, 1914, £9,577; August, 1913, £19,284; July, 1915, £37,827.

EXPORTS OF MOTOR CYCLES.—August, 1915, 1,092; August, 1914, 1,324; August, 1913, 1,130; July, 1915, 881.

EXPORT VALUE (INCLUDING PARTS).—August, 1915, £79,866; August, 1914, £77,121; August, 1913, £67,714; July, 1915, £64,601.

Seven foreign-made motor cycles were re-exported during the past month in addition to parts to the value of nearly £2,000.

SPECIAL FEATURES

A LADY'S RECORD RIDE IN LAKELAND.
SPRING FRAMES IN 1906.
FAULT FINDING AT THE FRONT

Accident to a Well-known Rider.

E. Kickham, who now has an ag in Bristol, was, near Salisbury, teac a pupil how to drive a sidecar, when latter charged a bank, throwing the senger out. A steam lorry coming behind unfortunately ran over Kickh left foot, causing a fracture. We glad to hear that he is making r progress.

Very Heavy Fines.

If the report in the local pres correct, a motor cyclist was very hea fined at Cardiff recently. He accused (1) of driving a motor cyc a speed dangerous to the public, (2) driving negligently, (3) of ignoring signal of a constable. The alleged s was from 20 to 25 m.p.h. (defen put it at 8 m.p.h.), and he ran in motor car which turned a corner, was thrown off his machine. Whe he did any harm to the motor ca not is not stated, but his fines on three summonses amounted to £42. defendant said he was unable to because his foot brake was broken, fortunately for him, he was not moned on this count.

Toronto M.C.C.'s Hill-climb.

There was a large crowd of ri in attendance at the first hill-c of the season, which took place Davisville on July 17th. The hill is of the worst in the neighbourhood being very steep and possessing a rough surface and three sharp bends

Grampians Road Good.

A Scottish authority states that the road over the Grampians is in good condition, there not having been a long enough spell of dry weather to break up the surface as usual.

Bromley Baker's P. and M. Sidecarrier.

A Bromley baker has just acquired a P. and M. and sidecarrier. The latter is complete and detachable, therefore at the week-ends he fits a pleasure type sidecar attachment. This has advantages over removing the carrier box and fitting a sidecar body, but is, of course, more costly.

Honour among Thieves (?)

A young man was recently sent to a Borstal Institution for two years at the London Sessions for being concerned with two men in breaking into a warehouse and stealing a motor bicycle and sidecar. The prisoner, Walter John Newman, aged 17, and the two men tossed up to decide who should wait outside the warehouse while the others entered. Newman lost, and then each took an oath not to "round" on the others. When arrested he refused to disclose anything about his confederates, but when remanded he gave their names, which has enabled them to be traced to Glasgow, but we understand they have not yet been arrested.

Average Prices.

We give below the average prices for the various second-hand models offered for sale in *The Motor Cycle*. We quote those models of which at least five weekly averages have appeared during the past two months. Where it is possible to obtain a sufficient number of each model we also give the average for the past week :

Make.	Year.	H.P.	Last week's average.	Average for past 8 weeks.

Illegally Equipped Motor Cycles.

At Garstang the other day, four motor cyclists were fined £1 each for not having two independent brakes on their machines. It is up to manufacturers and agents to see that their machines are properly equipped to comply with legal requirements before sending them out.

The Zeppelin Raid.

It was a curious sight the other night, when the Zeppelins were over the London district, to see motor cycles and sidecar combinations proceeding without lights. This mostly happened when it was all over, and we actually saw a policeman tell a sidecarist to light up. This was well over an hour after the raiders had gone home.

A Death in the Dardanelles.

The Cork and District Motor Cycle Club may well be proud of its record in connection with the war. The proportion of its membership that has joined the Forces is quite as high as, if indeed it is not higher than, any similar organisation in the United Kingdom. All the motor cyclists attached to the 10th Division Signal Company were members of the club. Although a great many of the men who joined have already seen much active service both in France and the Dardanelles, it was not until last week that a death took place amongst them. W. J. McCann, a prominent member of the club and a well-known figure in Irish competitions, has died of dysentery in Gallipoli, where he was serving as a despatch rider. Another prominent member of the club, Lieut. Haynes, of the 6th Munsters, has been wounded at the Dardanelles, and is now in hospital at Oxford.

Hill-climb, Army v. Navy Motor Cyclists.

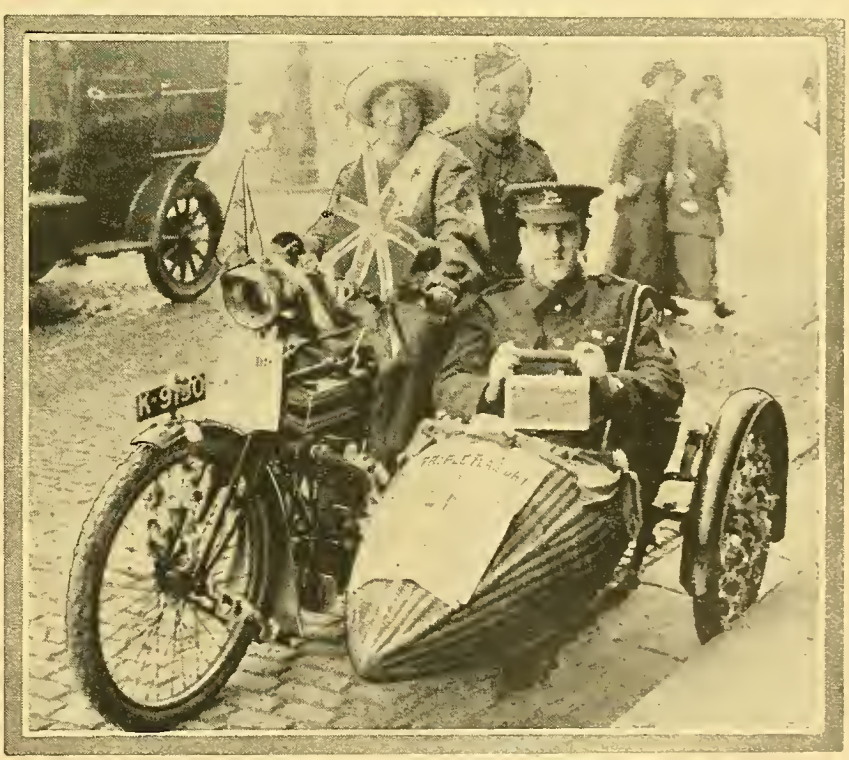
The complete regulations for the Army and Navy hill-climb on September 25th, organised by the Streatham and District M.C.C., were issued last week. There are ten classes, the first nine to be decided on *The Motor Cycle* formula, which is $\frac{C \times T^2}{W}$, whilst the other class will be decided on time.

Midland Section of the Fosseway.

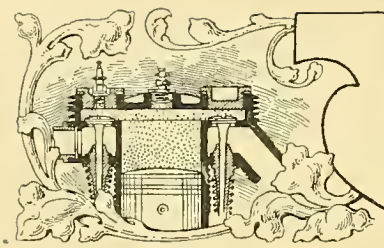
Last week-end we traversed the Fosseway between Leicester and Newark, and found that the road surface had, in common with most other roads throughout the country, considerably deteriorated in the last six months. The Leicestershire section was, as usual, by far the worst stretch, the Tarmac of the Notts end, withstanding its heavy traffic, in good style, yet showing signs of wear in many places.

Out-of-date Signposting in Leicester.

Any motorist desiring to travel North along the Fosseway may easily go wrong in Leicester, for when nearing the outskirts of the city there is an out of date signpost pointing to "Melton Mowbray and Grantham." This is the right road for Newark and Lincoln, and though the Fosseway has been in splendid order for two years, the authorities have still to think about erecting a proper sign. Incidentally, we should have thought that one of the local motor clubs would have brought about this necessary improvement. Not until one gets nearly to Syston is there any sign denoting the Fosseway to Lincoln, but on the Fosseway the signposting is excellent.

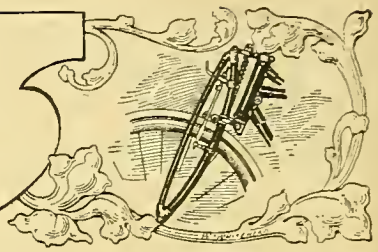


TRIPLE FLAG DAY IN LIVERPOOL.
A local sidecarist, Miss McNabb, does two kind actions at once—takes two wounded soldiers for an outing and collects for charities.



FAULT FINDING.

An Amusing Competition at the Front.



THE following account of a fault-finding competition, enjoyed by the despatch riders of the 2nd Division (in action) within a few miles of the fighting line, may be of interest to readers of *The Motor Cycle*.

It was decided that such a competition, besides providing much sport and amusement, would at the same time be of material value in making the competitors acquainted with intricacies of their mounts. Consequently the artificer had first of all a busy day in thinking out all the wily little dodges and traps imaginable.

Apparently, in England, at the present time, men training for despatch riding work are put through the mill in this respect as a part of their training. But most of the despatch riders of the 2nd Division have been right through the retreat from Mons and right through the war up to the present point and have not had this advantage, though it is undeniable that one and all are thoroughly efficient riders in spite of this. It would have been practically impossible to have held such a competition before the actual date, as the Division has been continually on the move. The C.O. readily gave his consent, and was quite keen on the result.

It appeared that nobody knew anything about the rules regulating such a competition, so it became necessary to draw up rules of our own. The competition as a matter of fact was decided on merit, comprising logical conclusion and coolness.

All the machines were 2¾ h.p. Douglases barring two Triumphs; below, unless otherwise stated, Douglas is assumed. The following is a list of the choicest faults with remarks.

Details of the Faults.

1 (K.B.R.)—Front cylinder exhaust valve fitted with rotten spring which had been heated red hot and all the temper removed, and one thickness of insulation tape passes round back cylinder inlet valve to prevent it from seating.

This competitor knew his machine so thoroughly that he suspected the inlet valve trouble; on inspecting the tappet clearance, he subsequently soon found the rotten spring.

2 (T.B.L.D.)—The high-tension wires to magneto crossed over so that both cylinders fired on induction stroke; also the jet choked up with silver paper.

The jet trouble was soon found, but the crossing over of the leads was a puzzler, and nearly caused this man to tamper with his timing.

3 (S.J.A.)—Induction pipe plugged up with rag, and one h.t. wire internally disconnected from carbon brush.

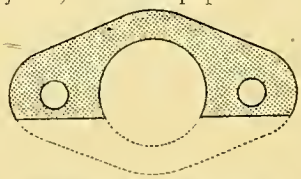
This man tried to get a spark at the plug which was out of action, and went straight to his magneto. Eventually he found the ignition trouble and attempted to start the bicycle with no result, at least for the time being.

4 (W.L.)—Carburetter air gauze completely bunged up so as to be unnoticeable unless held up to the light, also one plug shorted internally.

The plug was easily found, but the other was a teaser.

5 (W.R.)—Carburetter passage from jet to float chamber blocked (N.B.—There is no inspection hole on Douglas carburetters for this passage), and both h.t. wires disconnected internally from carbon brushes.

6 (H.B.)—Carburetter joint leaking air. (N.B.—these carburetters are attached by means of a flanged joint; the thin paper washers were removed from the joint and, instead, thick cardboard half washers inserted, so that the appearance was normal from the top, but there would be a gap if one lay on one's back and looked upwards from underneath.)



Cardboard washer cut away to admit air into induction pipe.

This gave a lot of trouble. If the carburetter were well flooded and the machine run hard with extra air lever shut it would give about twenty explosions and then cease. This unfortunate competitor probed about with a piece of copper wire, and found all the passages clear, eventually only finding the actual trouble at the last moment.

7 (N.W.)—Inlet valves not working at all, rockers having been entirely removed; also small trouble.

N.W. soon discovered the valve trouble and asked for the rockers, but was unfortunate enough to replace the timing wheel so that the wrong marks came together. Hence he had to dismantle again, and still found, much to his annoyance, that the machine was *hors de combat*. Occasion will be found to refer again to this competitor later.

8 (P.F.)—Magneto contact breaker internally shorted. (N.B.—The small central bolt which keeps the contact breaker on is insulated normally from the rear of contact breaker by small fibre bush which can be seen by peering down recess at back. This recess was plugged up with silver paper and the contact breaker screwed tight home.)

This was discovered, but it is a very neat little trick which would puzzle many experienced motor cyclists unless they know their contact breaker thoroughly, as the silver paper becomes part and parcel of the piece and has the appearance of being quite normal.

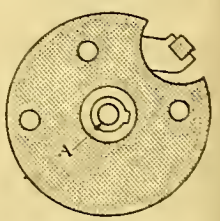


Diagram of back of contact breaker. "A" denotes point where silver paper washer was inserted.

Other competitors were J.B. and C.L., who had practically

MACKINTOSH OVERALLS
PURE PARA.

Pure Para Mackintosh Jacket.... Price, **36/9.**

Trouser Overalls, of finest quality. Price (without seat) .. .. **22/-.**

With seat, **26/3.**

These Overalls are made of the very best material, and the quality is unobtainable elsewhere.

In waterproof goods especially does it pay to use the best, because you are buying more pure rubber for every extra shilling you spend. The more rubber in a garment the longer it will keep waterproof.

BINKS
CARBURETTERS ON 2-STROKES

These grand little machines are wonderfully improved by fitting a Binks, it makes them **run slower without 4-stroking,** start easier and makes them tick over when in free, and greatly increases the mileage per gallon.

WHY NOT AT ONCE IMPROVE YOUR MACHINE.

I send on approval for 2 weeks' trial, and return your money, less examination fee, if you are not delighted with it.

TESTIMONIALS EVERY DAY.

"I have fitted the Carburetter and I find it does on my Allon 2-stroke 40 more miles to the gallon than with the carburetter sent out with the machine."

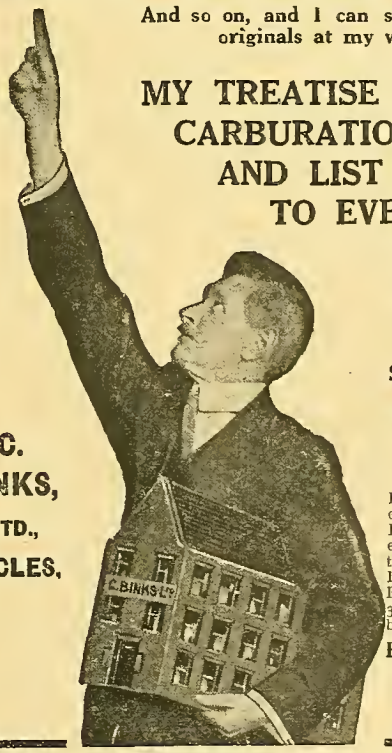
"I can now run at just half the speed without any 4-stroking. I am thoroughly satisfied."

"I have now got the jets right, and on my Calthorpe can do 115 miles to the gallon, and the power is marvellous."

"My machine is quite another thing since I fitted the Binks. Very little 4-stroking, 120 miles to the gallon, and terrific power."

"I have now got my Calthorpe to a fine state of perfection. It does 120 to the gallon with the hot air pipe, and runs very slow. The starting is marvellous. I can just sit on the saddle and give the machine a jerk forward and off she goes, and soon the speedometer is dithering between 35 to 40 miles an hour. If other Calthorpe riders get exactly the same Binks outfit as mine they will then have a machine that is practically perfect."

And so on, and I can show you the originals at my works.



MY TREATISE ON CARBURATION AND LIST FREE TO EVERYONE.

PRICE 49/-

With Spare Jets and full instructions.

C. BINKS, LTD., ECCLES.

Did you notice the easy way in which Pte. Kendal won every race he entered for at the Khaki Meeting at Brooklands, on his 3½ Norton, beating big twins?

He used a BINKS.

Hercules

—the Sidecar the ladies love.

LOOK! the lovely springing, the folding luggage grid, the safe attachments are just perfect. That's the Sidecar I want—with the beautiful lines and adequate protection in all weathers and so comfortable. We will send for a catalogue to-night, study the specifications and the pictures and then we can decide just which model will suit us best. Here's the address—

TO SKILLED ENGINEERS

Wanted Immediately

for munition work of the highest importance, large number of highly skilled men. Skilled men at present engaged on any work not required for the War are earnestly requested to make application at once to nearest Labour Exchange, mentioning this paper and No. A803.

The standard district rate will in all instances be paid, with bonus, and overtime. The average weekly earnings of similar men at present employed are very high.

TOOL SETTERS, for automatics, capstans, millers, spline millers, profilers, and small repetition work.

PRESS TOOL SETTERS, for large and small power and hand presses and drop stamp setters.

UNIVERSAL MILLERS for tool work, and to be trained as tool setters.

TOOLMAKERS, including tool turners, grinders, fitters, smiths and hardeners.

PRESS TOOL MAKERS.

TURNERS for shell production.

A suitable allowance towards the cost of removal to the district where employment will be given will, in certain cases, be made. Only highly skilled men are wanted and no man already engaged on War work should apply

Fault Finding.—

repetitions of the previous troubles. Both used excellent methods of tracing their troubles throughout. There were other various faults, but the above gives the more outstanding ones.

Amusing Incidents.

Several amusing incidents occurred in connection with the competition which are worth recounting. For instance, before his machine had been tampered with one competitor put a minute blob of sealing wax on every joint, hoping that, if it escaped the detection of the unsuspecting artificer, it might help him to localise the fault.

Of course, the artificer twigged at once and wasn't long in breaking all the joints and then tampering with the machine (and piling on the trouble into the bargain) and finally arming himself with a similar piece of wax and going over the bicycle with fiendish glee and an eye to deception.

In all cases it was deemed advisable to throw dust into the eyes of competitors by throwing dust and mud on to parts which had been tampered with, and in some cases burring nuts and screws which had not. A few unwary birds were caught in traps like these.

And now I must narrate a little yarn against the artificer, that is myself. Being the principal adjudicator I was not normally a competitor, but after the first day's competition the fellows surprised me by bringing out my Triumph and coolly informing me that I was expected to locate the faults which they had put their heads together to impose upon my machine. Nothing loth, I commenced to attack the job surrounded by a ghastly mob and found, without more than a moment's delay, that I was getting no spark.

Having satisfied myself that it wasn't the plug, I was just going to set about the magneto when providentially I found a pin stuck through my high-tension wire and hidden well within the guiding tube. On attempting to start my engine on the stand, however, there was no result. I took a rough glance at the timing and found that all was well, and just for fun I again looked at my high-tension wire, and found the same pin had been stuck in again whilst I had been looking the other way. This caused great amusement, but the engine still wouldn't go when it had been removed. Various funny remarks were passed by the crowd, chiefly by N.W., who suggested that perhaps it was the lamp. This audacious fellow was due for the morrow's competition, hence I was able to take easy revenge by giving him a hard task. He who laughs last, laughs best.

A Problem for Readers.

The trial proceeded amid great amusement, albeit great disadvantage to myself, and I soon found the carburetter was all right, all passages being clear and petrol level correct, but still very little result.

I will put the trouble in the form of a problem:

Symptoms.—Good spark, timing correct throughout, plenty of compression, all carburetter passages clear, petrol level correct, throttle and air slides working, no carbon deposit in cylinder, petrol itself pure. Engine will go if throttle be opened fairly wide, but will not go slowly.

For anybody who possesses a 1914 Triumph this may prove a very neat little problem. I may say that it took me an hour or so to discover the trouble, and even then, though I say it to my own disadvantage, I had to be given a hint.

The prize was won by P.F., but K.B.R. and N.W. were good seconds. B.R.R.

DESPATCH RIDERS AT THE FRONT.

Reading from top to bottom the pictures show—(1) A despatch rider rounding a well-graded curve in pretty surroundings. (2) In a communication trench. (3) Despatch riders after a swim. (4) A fine stretch of road.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Two-stroke Lubrication.

I have had some trouble with a 2½ h.p. two-stroke. It is very oily and smoky. The plug easily soots up. I changed a 28 jet for a 26, but it is no better, and now I can only give a very little air. Should I use less oil with the petrol or reduce the amount of the drip feed? I have so far followed the directions given, but once when I used petrol alone in the tank it ran particularly well.—R.E.F.

Surely if the engine is fitted with a drip feed lubrication system the petroil system is not needed, so we should say you can safely use petrol alone in the tank, and keep your drip feed running to a reasonable extent.

Petrol Consumption on a Two-stroke.

(1.) I have recently bought a two-stroke motor cycle fitted with Senspray carburetter, No. 30 jet. I get an average of about 70 to 80 m.p.g. I have tried both a 26 and 28 jet, but when I advance the air lever it immediately starts to backfire and slow down. With a 30 jet I can run with the air lever fully open and the throttle lever in the same position. (2.) I shall be glad to know how I can get a larger mileage per gallon, as I understand that I should get at least 100 m.p.g. I have a friend with a similar machine with a 28 jet who gets 120 m.p.g. I may also state that when travelling from 15 to 20 m.p.h. the engine fires like a four-stroke. How can I remedy this?—J.W.

(1.) There is no doubt that a 26 or 28 jet is too small, as you should be able to give a certain amount of air, at the same time improving the running. (2.) The difference in the miles per gallon between yours and your friend's machines may be due to the fact that he is a lighter weight than you; his machine may be geared more suitably, or it may be in better condition than yours. To get the best results, you should make sure the engine is in perfect order, piston and cylinder quite free from carbon, rings free, etc. Unfortunately, this habit of four-stroking is a fault from which many two-strokes suffer, especially when running light on down grades, etc. It is usually due to faulty carburation or choked exhaust. See *The Motor Cycle* for September 2nd, page 231.

Auto-wheel Taxes.

Is it necessary to take out a licence for an Auto-wheel? If so, what licences are necessary?—T.R.

Yes; you have to take out full motor cycle licences for an Auto-wheel. These will be: Local taxation licence, available until December 31st, 1915, and obtainable from any Post Office, £1; registration, obtainable from any county or borough council in the United Kingdom, 5s.; driving licence, obtainable from your local licensing authorities, 5s. An Auto-wheel attached to a pedal cycle is legally a motor bicycle.

Overheating and Loss of Power.

What is the cause of overheating and loss of power? I cannot open the throttle without causing misfiring. The rings seem all right, and I have ground the valves in. Would I be able to put a sidecar on my machine, a 3½ h.p. single-cylinder, with a multi-pulley attached?—B.B.

The trouble seems to be due to your using too large a jet. This would account for the overheating and loss of power, and the engine would choke when you opened the throttle. A variable pulley gear would be of some use to you, and would certainly be of assistance when you are using a sidecar, which the machine should pull quite well.

Chain Adjustment.

I have a 1914 two-speed clutch model Indian. (1.) When the machine is on the stand and the rear chain is removed, the back wheel revolves freely, but when the chain is replaced and the gear is in the neutral position I cannot spin the wheel more than half-way round. The gear box is adjusted correctly, and the chains are not too tight, so I think the clutch is too tightly adjusted. Can you tell me how to dismantle it, as two of the spindles on which the rollers revolve are loose on the back plate? (2.) What is meant by adjusting chains at the tight place? Should I measure the sag of chain at top or bottom, and what should this sag be in each chain? (3.) Kindly tell me how to alter carburetter to suit benzole.—WHITE ROSE.

(1.) The fact that you cannot spin the wheel freely with the chain on is probably merely due to the resistance of the grease in the gear box. To dismantle the clutch, it is only necessary to undo the four adjusting nuts, when all the plates can be withdrawn. (2.) To find a tight place, turn the wheel gently round, and note when the chain is least slack, then adjust the chain till it is not quite taut (there must be no strain on it). You will probably find an up and down play on the slack side of the chain when the wheel is turned. (3.) Use a slightly smaller jet, and place a small copper washer on the float to weight it, as benzole is heavier than petrol.

Too Strong a Mixture.

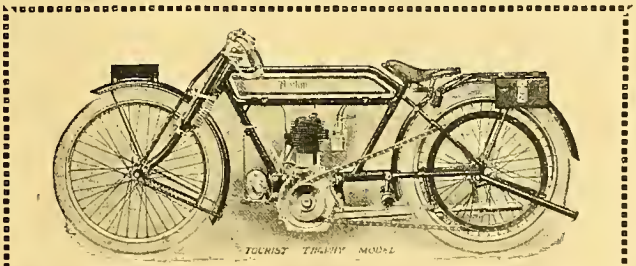
I have a 2¾ h.p. motor cycle, and have (1) difficulty (occasional) in starting. I often have to run the machine along the road for several hundred yards before I can get it to fire. The engine turns over all right, but there is no explosion, and when they do begin they are very irregular, first one in ten yards pushing, then two or three, but afterwards it gets regular. Injecting petrol is ineffective, also flooding the carburetter (a Senspray). The plug being changed makes no difference. The firing afterwards is perfect, and sometimes I am able to start right off easily. (2.) Up to 33 m.p.h. the engine is regular, but on opening out the throttle further (air full out) it misfires, and thus the increase does not give more speed. This gets more obvious as the throttle gets right open. (3.) I have run the machine 2,500 miles (it was cleaned internally at 2,000 miles), and now find I have to open wider for hills which formerly I could do on one-third throttle, and occasionally the engine gets very hot.—H.S.

(1.) Your trouble is most likely due to too rich a mixture. With this make of carburetter it is not advisable to flood it for starting, and if you have to at all do it very slightly. Simply depress the needle valve once or twice. (2.) The missing at speed is possibly due to the same cause. (3.) The cause of the engine overheating can probably be traced to the too rich mixture also. You should try a slightly smaller jet. An engine of this kind should be cleaned out and the valves ground in every 1,000 miles to obtain first-rate compression and thereby good running.

Norton

THE NORTON DOES IT AGAIN

at the **United Services Meeting** at **Brooklands,** and, as at the Khaki Meeting, carried off the PREMIER HONOURS, not only **WINNING** its own class **EASILY,** but also **FIRST PLACE in the UNLIMITED Class,** the little All-British NORTON of 490 c.c. **BEATING SEVERAL FOREIGN MACHINES** of 1,000 c.c., including special racers—ONE WITH PORTED CYLINDERS.



WHY GO ABROAD

for heavy, expensive, and complicated machines when the 490 c.c. SIMPLE SINGLE-CYLINDER NORTON GIVES MORE POWER AND SPEED AND NO TROUBLE.

Put *Your* Advertisement

in

THE MOTOR CYCLE

—and be *sure* of speedy and satisfactory results.

"Must be Hard to Beat."

"I may say your paper as an advertising medium must be hard to beat, as a single advertisement brought me thirteen replies for a free-engine wheel, which I disposed of. You may use this if you desire." HAROLD E. MONTEITH.
12, Gladstone Place, Stirling.

"Sold within half-an-hour."

"I should like to mention that a few weeks ago I advertised a second-hand machine in *The Motor Cycle* and had eighteen enquiries, and sold the motor within half-an-hour of the issue of your paper." F. J. MAW.
47, Skelton Road,
Forest Gate, London.

"A Shoal of Replies."

"One insertion in Miscellaneous column of *The Motor Cycle* brought a shoal of replies, and every article sold. We are unable to answer every one."
BARKER & CO.
Automobile Engineers,
Bradford Road, Huddersfield.

"Could have Sold Gear 40 times over."

"I deeply regret to disappoint Mr. —, but through the advert. (in *The Motor Cycle*) I could have sold gear about forty times over. Several wire money orders received, also cheques."
A. G. GARTON.
140, Porter Street, Hull.

"Each advert. a Great Success."

"I have had several advertisements in your paper, and each has been a great success. A short time ago I advertised an F.N. engine, and as a result spent quite a small fortune returning postal orders. It was sold by wire the day *The Motor Cycle* was published, and about six weeks afterwards I had an enquiry from India. One advertisement in *The Motor Cycle* is worth half-a-dozen in any other paper." JOHN W. WALKER.
Buchlyvie, Stirlingshire.

"Forty Answers."

"I was very pleased with the advert. in your paper, having had about forty answers." (Miss) D. JACKSON.
Fairfield, Birchington, Kent.

There is
NO DOUBT
as to the
SUPERIORITY
of
THE MOTOR CYCLE
for
Miscellaneous Advertisements

Read
THE EVIDENCE
of
ADVERTISERS

¶ **This remarkable success of "The Motor Cycle" is attributable to the fact that it has the largest circulation of any paper of its kind and is read by the right sort of people.**

"Results of ad. Excellent."

"*Re* my advt. in *The Motor Cycle* of the 10th inst., No. 6839. Although the machine was sold before issue, I received through your paper thirty replies—some of these from York, Derby, Wilts, Hants, Dorset, Sheffield, Cardigan, etc. — and several callers, two of whom arrived at the same time, and were willing to bargain. I consider the results of advt. excellent." E. H. COLE.
4, De Castro Terrace, Canterbury.

"Undoubtedly IT."

"A fortnight ago I advertised a side car, which I sold the same morning as your paper came out; also a B.S.A. motor cycle, which I sold directly afterwards. I could have sold it five times over again. Your paper is undoubtedly IT." F. MERRIMAN.
"Highbury," Beech Tree Lane,
Cannock, Staffs.

"The Usual Success."

"Following the sale of my B.S.A. combination through the medium of your valuable paper, I advertised a cover and tube, and am pleased to say that the *usual success* was attained, same being sold next morning following day of issue. I was compelled to return several cheques and money orders." F. MERRIMAN.
Beech Tree Lane, Cannock, Staffs.

"Very pleased with result."

"I thought I would like to acquaint you with the success of my advertisement appearing in *The Motor Cycle*.
The same evening I received several calls; the second caller purchased machine at quite a satisfactory figure! You can guess I am very pleased with such a result, and more so as it is the second machine I have sold through your paper with similar dispatch."
EDWIN T. DEACON.
"Falconhurst," Blagdon Road,
New Malden.

N.B.—The rates for paragraph advertisements are given on page 30

Speed of 3½ h.p. Twin Machines.

I think of investing in a 3½ h.p. twin motor cycle. Can you tell me the greatest speed and the consumption of petrol?—A.W.K.

We should say that such a machine would be capable of fifty miles an hour, and that the consumption of petrol would be about eighty miles to the gallon.

Fitting a Larger Cylinder.

I have a 2½ h.p. two-stroke, 70×70 mm. If I fitted a new cylinder 75×70 mm., would the increase of power be appreciable, and would it upset the balance of the engine?—POWER.

The increased power would be appreciable, but the balance might be affected, as you would require a slightly larger piston. The engine could, however, be balanced by an expert to make up for this additional weight.

Fitting a Speedometer to a Bat.

I noticed in *The Motor Cycle* a paragraph on how to fit a speedometer to a Bat motor cycle front wheel. I have searched for this, but I cannot find the issue with it in. Would you kindly let me know how you fit one.—F.W.

There is no difficulty in fitting a speedometer to the Bat spring forks. The arm which supports the small gear wheel and cable mechanism is attached to the wheel spindle. You will find that the distance between the two gear wheels remains the same when fitted in this manner, but with this type of fork you will require a rather longer cable than with the Druid type. See page 163, *The Motor Cycle*, February 18th.

READERS' REPLIES.

Shorting in Wet Weather.

I have been troubled in the same manner as your correspondent "R.M.," and found, after experiencing numerous "shocks," that the cause of the trouble was a saturated rainproof coat, which was sufficiently long continually to catch the sparking plug. The rain, being a conductor, caused considerable short-circuiting.—J. E. HENSHAW.

No Compression in Front Cylinder.

"A.M." writes in your August 19th issue of *The Motor Cycle* about lost compression in the front cylinder of his 2¾ h.p. Douglas. I had the same trouble, and thought the leak was to the crank chamber, but after grinding the valves in very carefully, I find that the machine runs very well, and has got its full compression in both cylinders. The valves have now got a good bearing all round the seatings and the whole width.—G.F.C.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"W.H.H." (Rudgwick).—Torogo two-speed gear for engines of 3½ to 5 h.p.

"W.B.L." (Ardrossan).—2¾ h.p. Douglas with sidecar. Speed, efficiency, and hill-climbing.

"J.P.M." (Glasgow).—Grado multi-pulley; also Oakley sidecar. Springing and comfort.

"J.E.W." (London).—3¾ h.p. Scott and sidecar. Reliability, ease of starting, hill-climbing, general efficiency, and upkeep.

A GROUP OF OFFICIALS AT THE BROOKLANDS UNITED SERVICES MOTOR CYCLE RACE MEETING.

Among the officers are Major D. F. Nicholl, Lieut. Neill (R.N.V.R.), Colonel Lloyd, and Dr. Low (Lieut. R.F.C.). Mr. Otto Thomas (chairman A.C.U.), of "The Motor Cycle," and Mr. T. W. Loughborough (secretary A.C.U.) are also among the group.

Tavistock, Two Bridges, Moretonhampstead, Exeter, Sidford, Colyford, Lyme Regis, Bridport, Dorchester, Bere Regis, Wimborne, Ringwood, Cadnam, Totton, Southampton, Fareham, Havant, Emsworth, Chichester, along the Arundel road to the Bull's Head Inn, Slindon, Whiteways, Houghton, Amberley, Storrington, Washington, Ashington, West Grinstead, Cowfold, Cuckfield.

BIRMINGHAM TO HANDFORTH.—H.R.S.

Birmingham, Sutton Coldfield, Lichfield, Weston, Stone, Trentham, Newcastle-under-Lyme, Red Bull, Congleton Alderley, Handforth. As far as we know, the roads are in fair condition and the journey could be easily done in a day.

WANTAGE TO WEYMOUTH.—C.H.A.

Wantage, Ashbury, Swindon, Avebury, Devizes, Westbury, Warminster, Shaftesbury, Blandford, Dorchester, Weymouth

LONDON TO PLYMOUTH.—A.L.G.

London, Kingston, Cobham, Ripley, Guildford, Hog's Back, Farnham, Alton, East Tisted, West Meon, Bishop's Waltham, Botley, West End, Bassett, Shirley, Totton, Cadnam, Ringwood Wimborne, Bere Regis, Dorchester, Bridport, Lyme Regis, Colyford, Sidford Exeter, Chudleigh, Ashburton, Ivybridge, Plymouth.

CHESTER TO NORWICH.—P.R.

Chester, Nantwich, Woore, Pipe Gate, Stone, Uttoxeter, Burton-on-Trent, Ashby-de-la-Zouch, Loughborough, Melton Mowbray, Oakham, Stamford, Market Deeping, Crowland, Wisbech, Downham Market, Swaffham, East Dereham, Norwich.

HENLEY TO WOLVERHAMPTON, avoiding the steepest hills, and distance.—E.B.

Henley, Nettlebed, Dorchester, Oxford, Woodstock, Enstone, Shipston-on-Stour, Stratford-on-Avon, Alcester, Crabb's Cross, Bromsgrove, Stourbridge, Kingswinford, Wolverhampton. The distance is approximately 100 miles.

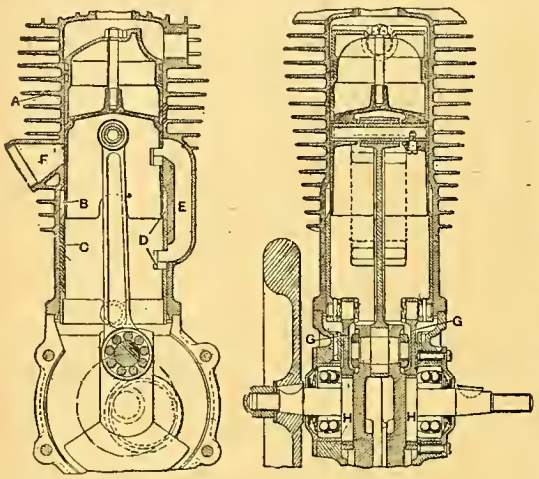
BIRMINGHAM TO EXMOUTH.—K.S.E.

Birmingham, Bromsgrove, Worcester, Tewkesbury, Gloucester, Stroud, Nailsworth, Bath, Radstock, Wells, Glastonbury, Durston, Taunton, Wellington, Cullompton, Exeter, Topsham, Exmouth, or Taunton, Blagdon, Churchingford, Honiton, Sidmouth, East Budleigh, Exmouth. The distance is approximately 180 miles. The latter route is likely to be more picturesque, but more hilly.

PATENTS BY ERIC W. WALFORD.

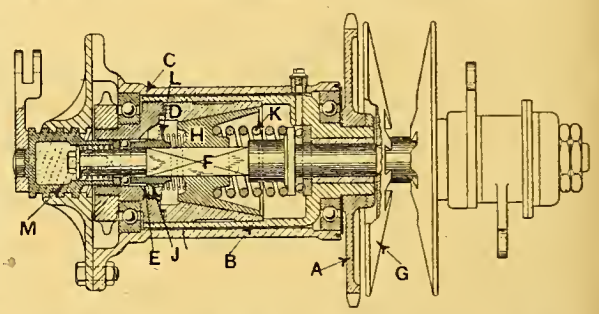
A Two-stroke Slide Valve Engine.

In the ordinary three-port type two-stroke engine, in which the exhaust port and transfer passage are both opened when the piston reaches the bottom of its stroke, the best results are not obtained owing to the pressure of the exhaust gases remaining in the cylinder when the transfer passage admits the fresh charge. Further, induction of the fresh charge into the crank case takes place only during a brief period when the piston is near the top of its stroke, so that complete filling of the crank chamber is not obtained. To overcome these defects, the present invention introduces a sleeve valve, which controls the opening and closing of the inlet port and transfer port, so that improved positioning and timing of these ports is obtained. The cylinder A is slightly enlarged in bore, as shown at B, to receive the sliding sleeve valve C. This valve is formed with two sets of ports, one of which (not illustrated) controls the admission of gas to the crank chamber, and this port is so arranged that induction takes place during a considerable part of the up stroke of the piston, ensuring an ample charge. The other set of ports is shown at D, and acts to open the transfer passage E after the exhaust port F has been uncovered a suitable time by the top of the piston. The sleeve C is reciprocated by a pair of rods G mounted around eccentrics H carried by the engine shaft, the angle of eccentricity being arranged to effect the port openings at the desired times.—The Enfield Cycle Co., Ltd., and F. W. Smith, No. 8,418, 1914.



A Zenith Clutch Improvement.

This is a combined friction and positive clutch, and has been designed for use with the Zenith countershaft variable gear. The chain sprocket A, which is driven from the engine, is carried upon a sleeve B adapted to rotate in a casing C. This sleeve carries an internal cone clutch member D, and also clutch dogs E. Passing through the sleeve B is the driven shaft F, to which is connected belt pulley G. Upon the shaft F is arranged, free to slide but not to rotate, the external friction cone H, together with a dog clutch part J. The friction cone is pressed into engagement by a strong spring K, whilst the light spring L exerts pressure on the dog clutch J. A quick thread actuating device M works through the casing A, and first meets with the positive clutch J, pressing this out of engagement. Further movement brings the clutch J into contact with the clutch cone H, releasing this. Conversely, on re-engagement the cone clutch first operates, after which further movement allows engagement of the positive clutch. —F. W. Barnes, No. 15,747, 1913.



The Royal Ruby Works.

Visitors to Manchester, whether riders of Royal Rubies or not, are invited to pay a visit to the Royal Ruby Works and inspect the processes of manufacture.

Bowden Wire Factory.

Messrs. Bowden Wire, Ltd., have found their business increase so largely that the capacity of their three factories is inadequate for their needs. They are, therefore, constructing a new factory near Willesden Junction, which, it is to be hoped, will be in full swing before Christmas.

Our Bookshelf.

"The Irish Motor Dictionary." W. Tempest. The Dundalgan Press, Dundalk. 1s. We are in receipt of the 1915-16 issue of this useful book. The early part contains a good deal of information of value to the motorist, while the major portion is devoted to a list of owners of motor vehicles in Ireland, giving the registration numbers, the owners' names and addresses, and a reference as to whether the vehicle is a car or a motor cycle.

"The War, 1914-15: Mentioned in Despatches. Part I., from August, 1914, to June 11th, 1915." 1s. *The Army and Navy Gazette*, 22, Essex Street, Strand, W.C. This book is one which should be in the hands of every patriot. It is exceedingly comforting to possess a record of the brave deeds of our officers and men, so clearly set forth as is the case in this publication. A careful perusal of the numerous honours and rewards contained in the book discloses the names of many old motor cyclist friends, who have gained distinction in the service of their country while still pursuing the pastime to which we are all so deeply devoted.

SPARKLETS

The Mex Motor Spirit Map of the River Thames (1s.). The Bowring Petroleum Co., Ltd., Finsbury Court, Finsbury Pavement, E.C. The map shows in thirty-two sectional plates the river from London Bridge to its source, together with roads and railways in the adjacent country. In the appendix are given an extract of byelaws affecting petrol launches on the Thames, a synopsis of the rules of the river, and some information concerning Mex motor spirit. The map is well printed and clear, and should be useful to motor cyclists.

Messrs. Gall and Inglis have lately brought out a map entitled "The Graded Map of West Yorkshire," which may be obtained from our publishers, price 1s. 6d. By an ingenious system of colouring, the relative values of the different roads are shown, and in the hilly country, or in the industrial districts near Leeds, the motorist may pick out in a moment the best road between two points. Black triangles show where severe hills are encountered, purple lines show where there are tramlines, yellow lines fast roads, and blue lines those roads which are exceedingly rough and hardly worth traversing.

Souvenir of the King's Visit.

We have received from the Birmingham Small Arms Co. an illustrated souvenir of His Majesty King George's visit to the B.S.A. Works, Small Heath. A copy of this souvenir, which contains an actual photograph of the King and a facsimile of his autograph, has been presented to every employee.

A Novelty in Guarantees.

The Harley-Davidson Motor Co. have forwarded to us a copy of their late season catalogue for 1915, which contains descriptions of the various models, together with the two and three-speed gears and other details. The Harley-Davidson guarantee has now been extended to one year, provided that the registration card is duly signed and forwarded to the company, but the guarantee for sidecars is limited to use with the Harley-Davidson sidecar chassis.

The name guarantees the greatest mileage at the least cost

OVERALLS MADE BY A PRACTICAL RIDER

Are the most satisfactory, because the man who rides knows what is wanted

My Overalls praised by every user, splendidly made, contain improvements not found in other makes. Improvements tried out on the road, and perfected during ten years motor cycling experience, after long tests of different styles of cut and qualities of material. A motor cycling suit that gives absolutely complete satisfaction always.
The price for complete Suit from - 35s.
Competes with prices asked by others for lower grade productions without my improvements. And I sell only dependable goods. Read all about these overalls in my booklet. Write for a copy. It will solve your clothing problems.—Irvine Smith.

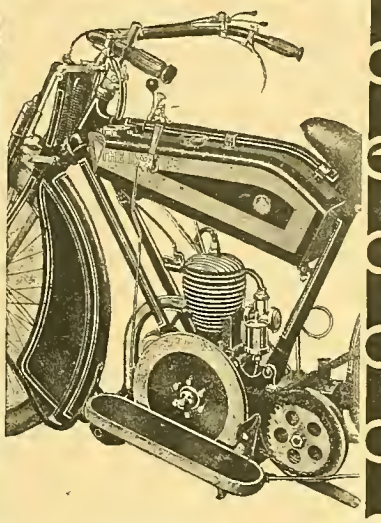
The "IVY" TWO STROKE



Above illustration shows our new pattern frame that will from now be fitted to our "De Luxe" Model Two-Stroke machines only. It is our registered design No. 531848, and the principle is as follows:—Instead of the usual round down tube coming from the ball head, we bring two oval blades from a specially designed ball head down on each side of the exhaust pipe to the crank case. Each of these blades is double the strength of the ordinary round down tube, and is made of a specially toughened steel which will stand being twisted a number of times without breaking. This frame is no heavier than the ordinary diamond frame, and is

ABSOLUTELY UNBREAKABLE.

Other exclusive features of our "De Luxe" model are—

Special shaped tank, holding 1¾ galls. petrol, ¾-gall. oil; comfortable footboards; machine enamelled khaki-grey; marvellously efficient engine, etc.

It is no wonder the machine is called

THE ARISTOCRAT OF ITS TYPE

31h.p. Triumph, 1912, just overhauled throughout, re-enamelled, new 1915 cylinder, piston, and valves (bill shown), nearly new tyres and belt, all accessories, splendid condition; £28.—Davis, Chauffeur, Pantglas, Goldengrove, Carmarthenshire. [X6895

TRIUMPH, 1911¾, 2 speeds, 2 clutches, Montgomery sporting £15 sidecar, re-enamelled, re-plated, overhauled, no running since; any trial; will drive 20 miles real buyer; £38, or offers.—Eric Dower, 17, Sussex Place, Regent's Park, London. [X6960

1911-12 3½h.p. 3-speed Triumph and coachbuilt sidecar, screen, lamps, horn, speedometer, new tyres, belt, 2 spare tubes, grid; trial anywhere; or exchange 5-6h.p. Clyno or Indian combination, cash adjustment; £38/10.—Stallwood, 19, Richardson St., High Wycombe. [2784

TRIUMPH Junior, delivered in April, only done about 800 miles, exceptionally fast, condition perfect, absolutely unscratched, Lucas horn, Bosch mag., insurance for next 6 months; £35; no offers; owner buying car.—Hedgeland, 6, Cripley Rd., Oxford. [2730

TRIUMPH, late 1910, 3½h.p., clutch, covers (Palmer, Kempshall), new, F.R.S. lamp, new horn, Brooks leather box on carrier, engine perfect order, re-bnshed last January, wants re-plating and enamelling; £22.—Smith, Ivy Cottage, Dinerth Rd., Colwyn Bay. [X6713

TRIUMPH, 1914, 4h.p., 3-speed, clutch, coach sidecar, screen, hood, electric horn, Lucas horn, Watford speedometer, head and tail lamps, several spares, including tyre, 2 new tubes, new belt, etc., and tools complete; £65, cost £95; new November last, done 2,800; trial any time by appointment; this combination is better than new.—L., 38, South View Av., Caversham, Reading. [2689

Trump.

TRUMP-J.A.P., 1914, 4h.p., 3-speed, kick start, clutch, perfect condition; bargain, £33.—28, William St., Rochdale. [2654

Vindec.

6h.p. Vindec Special, and sidecar, 2-speed, free, foot start, with dickey seat; £26.—A. E. Walker, 90a, Elsinore Rd., Forest Hill. [2465

VINDEC Special, 1911-12, 5-6h.p. Peugeot, free engine, sidecar, very good condition; £23.—108, Bennerley Rd., Wandsworth Common. [2480

Velocette.

VELOCETTE, all models in stock, from £28.—Marston's, 26, Bridge St., Chester. [X6927

VELOCETTE 2-stroke, 2-speed, only 6 weeks old, as new; £30.—Wells, Salway Hill, Woodford. 'Phone: 14. [2720

V.S.

V.S. Combination, 8h.p., 2 speeds, F.E., just overhauled, Jones, and accessories; bargain, £30.—Dodson, 50, Perkins Rd., Newbury Park, Ilford. [2587

Williamson.

WILLIAMSON 8h.p. 1913 Combination, good condition; £45; exchange lower power.—Spurling, The Cottage, 2, Brondesbury Park. [2783

WILLIAMSON 1913 Water-cooled Combination, P. and H. lamp, speedometer, new Clincher back; £55.—Lamb, 96, Thornton Av., Chiswick. [2530

Wolf.

WOLF 2½h.p. Lightweight in stock; generous deferred terms if desired.—Lamb's, 151, High St., Walthamstow. [2440

WOLF, 2½h.p. J.A.P., as from makers, never ridden; owner gone to Front; price £24.—Apply, Thomas, 24, Townley Rd., East Dulwich, S.E. [X6740

MOTOR CYCLES FOR SALE.

Yale.

YALE Motor Cycle in stock, 8h.p., 2-speed, kick start; 60 gns.—Jones, The Broadway, Muswell Hill. Sole agent for N. London, trade and retail. 'Phone: Hornsey 2562. [7636

Zedel.

3h.p. Zedel, C.A.V., mag., B. and B. carburetter, fine condition, very low and fast, F.R.S. lamp; bargain, £14/10.—90, Burton Rd., Lincoln. [X6875

Zenith.

ZENITH, 6h.p., 1912½, clutch, kick start, Canoelet sidecar; £45.—Seen at Stag Motor Works, East Finchley, London, N. [2627

ZENITH, 1912, 6h.p., Millford spring wheel sidecar, accessories, excellent condition; £35.—M., Ingleside, Hook Heath, Woking. [2799

ZENITH Combinations, 3 in stock, all as new; £55, £65, and £75.—Percy and Co., 337, Euston Rd., London. 'Phone: Museum 1337. [2766

ZENITH, 1914¾, 6h.p., Enfield sidecar, lamp, horn, spare cover, and belt, condition excellent, would separate; £56.—Lyndhurst, Devonshire Rd., Palmer's Green. [2513

ZENITH-GRADUA, J.A.P., 4h.p., 1913, Middleton coachbuilt sidecar, nearly new, smart lot; £37/10.—Dairy Manager, Victoria Terrace, Tottenham Lane, Hornsey. [2709

ZENITH-GRADUA, 1914, 5h.p. twin, excellent order, horn, 2 lamp sets, plugs, tools, new tyre back; £40 cash.—Tom Simpson, Outfitter, Stalybridge, near Manchester. [2660

ZENITH-J.A.P., 1913, 4h.p., fixed engine, perfect condition, £3/3 head light, horn, tools, spares; £24; appointment.—Austin, 15, Pemberton Gardens, Highgate, N. [2687

ZENITH-GRADUA, 4h.p., thoroughly overhauled by makers Easter, new back tyre, inner tube, Service belt, sidecar, all excellent condition; any trial; £38.—13, Mayow Rd., Forest Hill. [2792

ZENITH-GRADUA, 4h.p., single, 1913, clutch, new May. 1914, new belt, tyres good, speedometer, lamps, spares, and Service cane sidecar; would separate; £39.—Aitken, 339, North End Rd., Fulham, S.W. [2551

ZENITH, 1914½, 8h.p., countershaft, coachbuilt sidecar, fitted with hood, screen, luggage grid, Terry links, spare driving chain and belt, 3in. tyres, 3 lamps, condition as new; bargain, £78, cost £110.—Hawkins, 206, Hard Lane, St. Helens. [X6947

ZENITH-GRADUA, 1915, countershaft models, delivered from stock, 8h.p. model H, 73 gns.; 3½h.p. twin model B, 59 gns.; other models 7-10 days. Pricea subject to 5% increase; exchanges or extended terms arranged.—Elce and Co., 15, Bishopsgate Av., Camomile St., E.C. [0481

Miscellaneous.

HEBDEN'S Have in Stock:

1915 Enfields, 6h.p. combination, and 3h.p. and 2¼h.p. lightweights.

1915 Indians, 3½h.p., 5h.p., and 7h.p., with or without sidecars.

1915 Wolf, 2¼h.p., 3h.p., 2-stroke, 2-speed; £31.

1915 Wolf-Peco, 2¼h.p., 2-stroke, 2-speed; £33.

1915 New Imperial-Jap, 2½h.p., 2-speed; 35 gns.

1915 New Imperial-Jap, 2½h.p., 2-speed, with clutch and kick starter; 41 gns.

1915 Wolf, 3h.p., 2-stroke, 2-speed, not run 300 miles, as new; £27, complete.

1914 Enfield 6h.p. Motor and Sidecar, fit with lamps, horn, speedometer, equal to new; £65.

1914 7-9h.p. Indian Motor, 2-speed, and sidecar, brand new, fit with electric lamps, horn, speedometer; a gift, £70.

1912 Humber, 3½h.p., 2-speed, 1914 engine, new Canoelet sidecar; £38, complete.

1913 8h.p. Williamson, water-cooled, 2-speed, and Canoelet sidecar, hood, screen, lamps, horn, speedometer; £50, a gift.

1913 2¾h.p. Douglas, 2-speed, free engine, clutch, and kick-starter, lamp, horn, equal to new; £37/10.

1915 Brand New Humberette Light Car, 3-speed and reverse, fit with non-skid tyres on back; any trial; best offer accepted.

1915 Brand New Williamson Cyclea Light Car, water-cooled, 3-speed; any trial; £120.

A FEW Cane Sidecars to clear from £2/10; brand new coachbuilt sidecar, Phelon and Moore, £15/15 model to clear.

BRAND New Canoelet Sidecar, coachbuilt, £16 model to clear.

Solo Machines in Winter.

A MONTH ago we dealt with the design of motor cycles used for Government purposes, and drew attention to certain slight weaknesses in those mounts which cause constantly recurring breakages. We have no knowledge whether some such scheme as we outlined to overcome the trouble has been adopted, but an article in the present issue on the question of mudguarding calls to mind the fact that with the approach of winter and muddy roads this important matter is one which should also receive immediate attention. Maybe the subject of proper mudguarding of motor cycles has been studied already in anticipation of the winter campaign, but the latest deliveries of mounts we have seen still have the standard English guard. Last winter it is a well-known fact that despatch riders were in some districts unable to progress more than three or four miles at a time without stopping to remove the thick mud which had caused the wheels to clog, due to the close-fitting guards. The trouble got so bad that practical riders, in many instances, removed the front guard entirely, and fitted in its stead a shield made of wood or leather, or whatever stiff material was handy, and attached it to the front down tube. It seems that all these difficulties are likely to be renewed this winter unless a very hasty change is made, the reason apparently being that there is no one in authority to study the specially severe conditions under which the machines are used in France, and to report upon desirable amendments in design.

On the subject of winter riding we should like to urge a trial of lightweight motor cycles for despatch riders' use. It is extremely doubtful if the non-motor cycling authorities who control Government orders realise that a lightweight machine fitted with a two-speed gear is a far more suitable mount for solo riding in grease. A rider may pick his way through the thickest and most treacherous grease on a handy, low built mount of about 125 lb. weight, where a heavy one is extremely difficult to handle and keep upright. Speed is of no avail on slippery winter roads, comfort and safety are of paramount importance. Being in touch with many despatch riders at the Front, we know it is a general rule for them for winter work to select the lightest machine they can get hold of consistent with reliability. On dry summer roads the case is different.

A Competition for Munition Workers.

THE ball has been set rolling in the matter of competitions for Army and Navy motor cyclists by reason of an officer's suggestion to *The Motor Cycle*. Already two highly successful and enjoyable events have been held at Brooklands, which, it is generally agreed, have been beneficial to mind and soul of the men engaged in them, and this week-end we are to have a hill-climb for members of both services. But in the enthusiasm for the events named some may have been inclined to have overlooked the munition worker, the man who is as indispensable to the success of our arms as the man in the trenches. A suggestion from a munition worker appears in our Correspondence columns this week, advocating the organisation of a competition in some convenient part of the Midlands, where thousands of busy war workers are to be found, and we must say that the suggestion strikes us as a particularly happy one, and just as deserving of encouragement as the meetings already held for the United Services. The writer pays us a compliment by suggesting that *The Motor Cycle* carry out the organisation, but this is impossible, as under the rules of the governing body of motor cycling all events must be organised by a recognised affiliated club. Here is a chance for some enterprising club to fill the breach. In the meantime, the views of other motor cyclists on war work would be interesting.

An index to the advertisements in this issue will be found on the page facing the back cover.

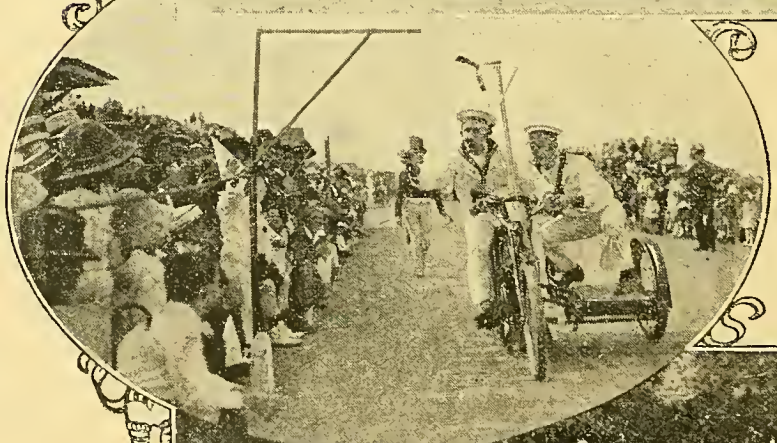
A Motor Cycling Gymkhana in South Africa.

COLONIAL CLUB RAISES MONEY FOR A WAR FUND.

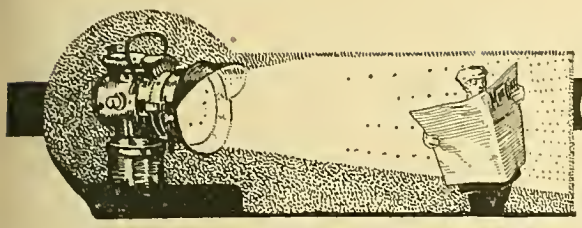
IT is quite refreshing in these trying times to read of a successful motor cycle gymkhana such as was held on August Bank Holiday last by the East London (S A.) Motor Cycle Club. The object was to wipe off a deficiency in one of the local war funds, and it appears to have been achieved with plenty to spare, thanks to the whole-hearted manner in which members of the club participated in the event and the enthusiasm of the spectators who numbered 2,500.

Judging by the photographs we have received, the results achieved in the way of decorating both machine and rider were excellent, and would rival many similar events held at home in the days before the war. The sidecar outfit disguised as a man-o'-war is particularly effective, though we cannot help feeling that the whiskers of the two occupants have something to do with the general pleasing effect!

The proceedings started with a procession of competitors and their decorated mounts through the streets of East London. This was in the morning, and in the afternoon the gymkhana events were run off, to the great amusement of competitors and spectators alike.



The East London M.C.C. recently undertook to augment the local war fund by holding a gymkhana, which proved highly successful. As the illustrations show, the costumes of the motor cyclists, as well as the decoration of the machines, were original and effective. One member of the club adopted a dress to represent *The Motor Cycle*.



Occasional Comments

"By Ixion"

My Epitaph.

A course of baby two-strokes has made a milksop of me; and, incidentally, it has spoilt the quondam refinement of my driving. It accustomed me to slamming the throttle recklessly open whenever I wanted an acceleration, however mild, for the babies do not get away with it like a T.T. racer. When summer arrived, I transferred my person to a 4 h.p. Douglas and a 6 h.p. Motosacoche, and applied the same throttle-slamming methods to them. Gee whizz! The bicycle went ahead all right in each case, but it was very nearly a case of "also ran" with poor me. My sorrowing wife has been instructed to have the following legend inscribed on my tombstone, "Unseated by acceleration." Joking apart, the way in which the modern twin jumps if its throttle is banged open is a positive revelation. I should much like to know how its capacity in this respect compares with a racing car. Both my twins are fitted with sidecar gears, and the leap they make under my crude driving methods is literally colossal. The difference between sidecar work with a 3½ h.p. and a 600 c.c. or 750 c.c. twin is indescribable.

Testing a Lighting Circuit.

With the decay of accumulator ignition the average motor cyclist has forgotten how to test the somewhat complex and lengthy accumulator wiring circuits in the event of a fault. The other week I struck a distinctly clever rider hopelessly baffled by a wee flaw in his lighting circuit. and without a notion how to proceed except by the crude method of tightening his terminals and inspecting his connections. Unless the fault is of the obvious, mechanical sort—*e.g.*, frayed wire ends at a connection shorting to some other terminal—a voltmeter or a glowlamp of the same voltage as the accumulator is really essential to tracing the trouble. For example, let us suppose that a single-pole circuit, in which the metal of the frame is utilised as the negative half of the circuit, is under discussion. The voltmeter on the switchbox indicates that the battery is fully charged, but no light is obtainable at any lamp. The first test might then take the form of placing one terminal of the voltmeter (or glowlamp) on the plus terminal of the accumulator, and the other on any convenient clean piece of metal on the frame, the switch being on. If the voltmeter registers no current, it is plain that the earth wire is at fault, which happened to be the case with the machine under notice. Examination showed that the earth wire was connected to a screw holding a footboard to a frame cross-spindle, and this spindle was stove-enamelled. The enamel obviously acted as a non-conductor, so a longer wire was coupled from the minus terminal of the accumulator to a polished steel crank case bolt. Instantly the lamps lit up. Supposing this first test had shown current on the voltmeter. it would be clear that the negative, or frame, half of the circuit was in order, and the next tests would take the form of coupling the voltmeter from some bright part of the machine to each terminal on the positive circuit in turn; we should have followed up the plus wire to its first anchorage on the switchbox, and tried for a reading across to the frame at that point; then from each plus terminal in turn, until at last the final cross reading would have been from the terminal in the lamp socket itself (against which the terminal in the bulb base presses) to the frame; if there were current here, a broken bulb would have been the fault. If there were no current here, the fault would have been in the last stretch of the positive wiring. All this was common knowledge amongst motor cyclists ten years ago, but the disappearance of the accumulator from our ignition systems has caused such information to die out from the average tinkerer's mind, and to-day many users of lighting outfits carry neither voltmeters nor testing lamps. Dynamo faults are much harder to identify, and the amateur can hardly hope to do more than expose his brushes, see that they are clean and unbroken, and that the portion of the armature on which they rub is also clean. Trouble at this point need not be expected within a decent mileage, the parts being almost (though not quite) as reliable as the carbon brush and slip ring of a magneto.

The 7-9 h.p. Harley-Davidson.

I have just had another spin on the new Harley-Davidson, and a jolly good mount it is; it is not every leviathan which can do 4 m.p.h. on top gear, and accelerate to a speed which only lunatics and experts

A NEW CONVERT TO THE MOTOR CYCLE.

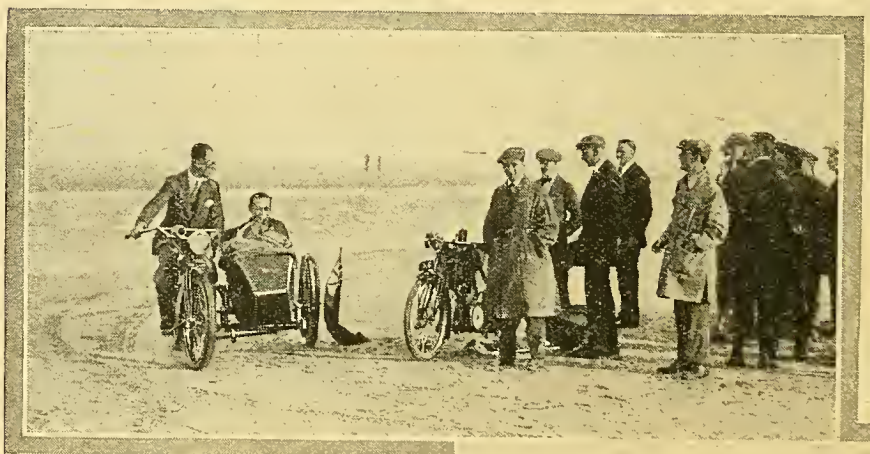
Mrs. W. Brandish, of Foleshill, Warwickshire, mounted on her 2¾ h.p. Douglas, which she has ridden nearly 2,000 miles during the summer.

Occasional Comments.—

consider safe on the public roads. Out of its general excellences I select a single item for commendation to the British trade. My sample was finished in a neat and workmanlike grey, and the enamel extended to the hooter and lamps. I admit I saw no reason why many plated details should not have been turned out in some rustless, untarnishable finish, but the non-plated finish of the lamp and hooter is a step in the right direction. Some British accessory dealers have got as far as blacking the bodies of their lamps and horns, but they usually cancel the good work by adding a plated rim or knob or two, just to relieve the monotony, so that the inevitable selvyt and metal polish cannot be given away after all. When will the trade understand that nobody but the very green novice really enjoys the daily furbishing of a multitude of plated twiddlies? We all understand that no enamelling process is applicable to metal parts liable to friction, and that nuts must have a finish of more resistance. Let us first get the hub shells, lamp bodies, hooter twists, etc., finished in enamel, and then let us howl and rage till the nickel-plating shops find their occupation gone, and some genius comes along with an oxidising process which cannot tarnish, and yet will not wear brown or shiny, as some of the earlier black platings are known to do.

Broken Chains.

My worthy colleague "Road Rider" has burdened me with some heavy correspondence by reason of his dignified dislike for printing precise details, and I propose to supplement his remarks about broken chains. In my experience there are two principal reasons for a chain breakage—at least, I have never known a case in which one of the reasons was not responsible, since the early days when foolish manufacturers blindly fitted push bicycle chains to powerful twin-cylinder engines. The commonest cause is destruction of alignment during adjustments for length; an ardent novice notices his chain is slack, falls on the machine with a bunch of spanners, corrects the tension, and never troubles to see that the sprockets are properly lined up again. A patent which made it impossible for chains to get out of line save only by twisting of the cycle frame would almost put an end to broken chains. The other cause is thoughtless adjustments of the tension. When a chain is noticed to be sagging droopily between its sprockets, the owner should not instantly adjust it tighter; he should first revolve the chain through a complete revolution, testing its tension at every third or fourth link the whole way round. From this process he will emerge with the discovery that a worn chain is *never* evenly slack or taut the whole way round. At one point of the revolution the chain will seem so taut that he will ejaculate, "Why, the beastly thing doesn't need adjustment after all!" and at another, "Great snakes, it's lucky the chain hasn't jumped the sprockets!" When he has found what "Road Rider" calls the "tight spot" (he should have said "the tightest spot"), he must adjust that particular length of chain—it may be only two or three links—as tight as is safe, and he has then made the best adjustment possible under the circumstances. For it is obvious that if the tautest piece of the run is overtight, it will snap presently. This explains why chains must sometimes be scrapped when most of their links are apparently in good condition; if the tightest spot is not dangerously tight, the loosest spot may hop off the sprocket. I have never solved the mysterious problem of this uneven wear. The details which make up the chain are standardised in every particular, and they all pass over the same teeth at the same place, whilst the sprocket sizes are designed to avoid any one link having to bear the brunt of the explosion time after time, whilst its neighbours merely chip in and take up the good work after the big bang is over. But the fact remains that chains do not wear evenly.

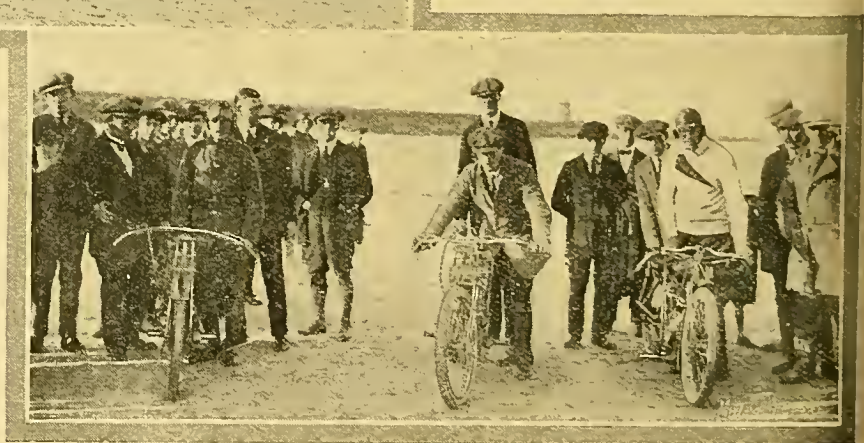


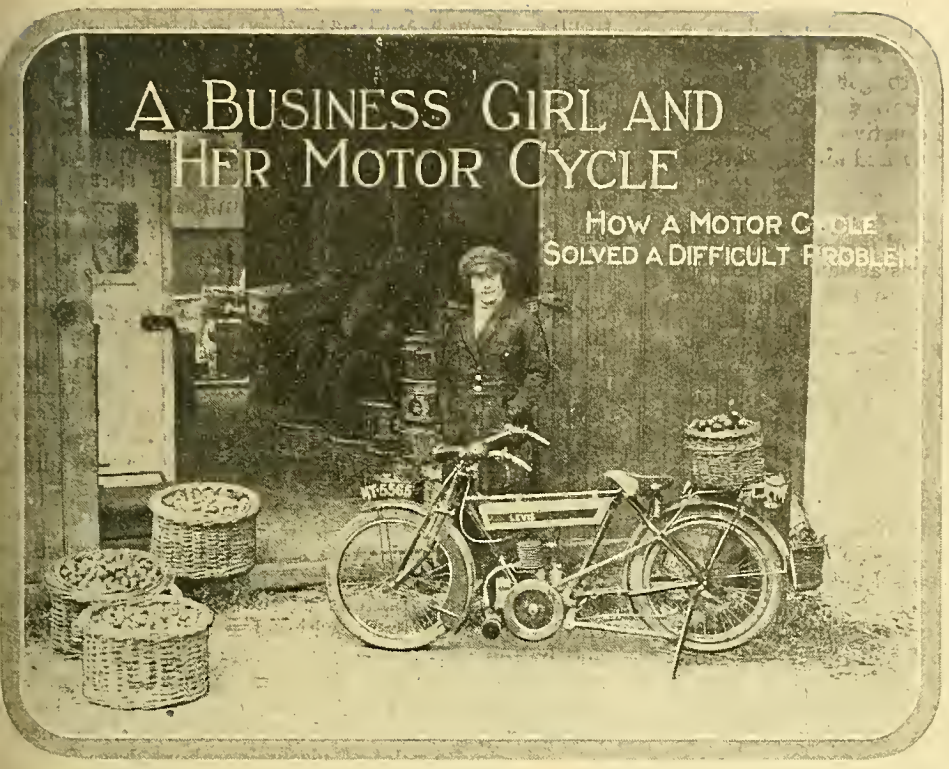
SCENES AT THE LAST PORTMARNOCK BEACH RACE MEETING.

(The results appeared on page 286.)

(1) G. A. M. Curtis (7-9 h.p. Indian), taking the turn in the sidecar handicap.

(2) The start of the 600 c.c. Scratch Race. Left to right, Corporal T. E. Greene of the A.S.C. (Rudge), F. Winstanley (Zenith), and C. B. Franklin (Indian).





I SUPPOSE after all it is the war that has caused such a great increase in the number of lady motor cyclists. Although it has also brought a tremendous lot of distress to the world in general, there is this little bit to its credit—it has made girls and women much more self reliant. Motor cycles were once thought too complicated for a girl to ride or manage, but, after my experience this summer, I am quite convinced that it is quite easy to learn to drive a motor cycle. As far as management is concerned, I know that, if I keep my machine clean and take reasonable care of it, nothing is likely to go wrong. I do not suppose, however, that I should have thought about having a motor cycle unless it had been forced upon me, as it were. Two or three years ago I was one of that great army of lady stenographers. I lived in London, lunched in the Strand, took my amusement in the form of a weekly visit to the theatre, and was generally a "Towny" girl.

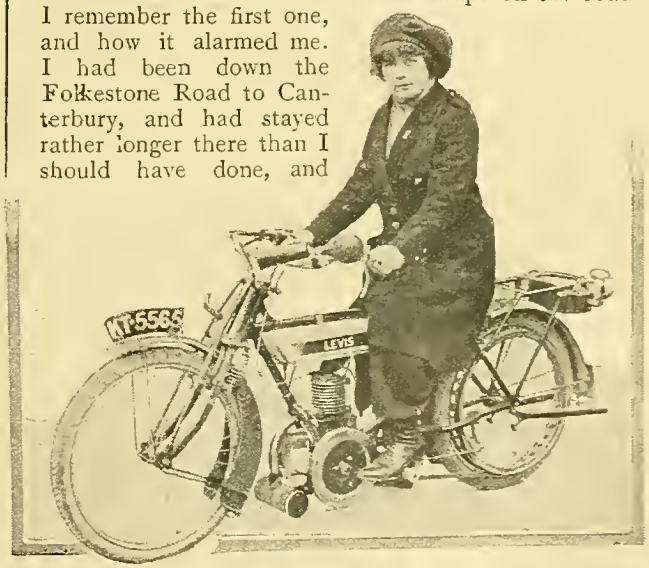
One may, therefore, imagine my disgust when I was told that the offices of the company with whom I was engaged were to be moved twenty-five miles out into the country and that I could either go with them or leave my position. As I was fairly happy with my employers, I thought at any rate I would try it for a month or two while I looked out for something else. I well remember the day when we first came down to Kent. It was raining, and the country did not come up to my conception of its delights. I only knew it in the summer time, when the sun was shining, the birds singing, and the corn was being harvested. I could only imagine what it was like in the winter, but on that cold dismal January day it struck me as being the most miserable place that one could possibly conceive. However, I remained until the spring came; then I began to know people, and so decided to stay the summer through.

My Purchases.

In August the war broke out, and nearly all the men on our staff joined up in some capacity or other. Then my chance came. Up to then I had not done outdoor work at all. The work of my firm—the Rural Development Co.—necessitates the employment of messengers from one department to another. These departments are spread over roughly 1,000 acres. In addition to that, we had 150 men to pay in various parts of the farm. I found that I could do the work of some of the men who had enlisted, but got tired of walking from place to place, and so bought an ordinary cycle, but soon sold it again. Then I bought my motor cycle—a splendid little two-stroke—and, from the business and the pleasure points of view, it has made all the difference to me. I can now realise the advantages of living in the country, and the journeys which were previously irksome interruptions to my work are now pleasing interludes.

In addition to the business advantages, of course, there is the pleasure side of the question. Leaving business at 5.30 p.m., I can now get up to town (twenty-three miles), go to a theatre, and get home by midnight.

Of course I have had a few mishaps on the road! I remember the first one, and how it alarmed me. I had been down the Folkestone Road to Canterbury, and had stayed rather longer there than I should have done, and



Miss D. Clegg and her two-stroke Levis.

A Business Girl and Her Motor Cycle.—

coming up Wrotham Hill at dusk my petrol gave out. Now I have never done any night riding before, and very much wanted to get home before dark, and here I was about a quarter of the way up the hill with no apparent alternative but to push the machine up the rest of the way and about a further six miles.

A Kindly Action.

I did what most other girls would do—sat down and felt "humpy." But deliverance was at hand! Coming round the corner was one of those tremendous cars which move so noiselessly and smoothly to the pleasure of their owners, and to the extreme irritation of "broken-down" wayside motor cyclists. As the motor neared me coming down the hill it stopped, and the man driving it very kindly asked me if he could be of assistance. Of course he could, and I told him I wanted a little petrol to get home with. Curiously enough, he had only a very little, so we sat down on the roadside and divided it between us. I found that he had to get back to Canterbury, so his generosity in letting me have some of the petrol was very pleasing in this hard and unsympathetic age.

Another of my little mishaps occurred on Westerham Hill, when the machine stopped halfway up—a most unusual occurrence. I knew I had plenty of petrol and plenty of oil, and the only thing I could think of likely to happen was a "sooty sparking plug." I found, however, that this was not the cause of the trouble. Here again I was helped by a fellow motorist, who, while passing, called out, "Have you konked out?" I did not at the time understand this expression, and answered that "I thought so." He very kindly stopped, and, after some investigation, found that the carburetter had become obstructed by dirt owing, he said, to the petrol not being strained. I always used to think that petrol was such clean-looking liquid and never thought it required a strainer, but I know better now, and so shall not have a similar trouble again.

With regard to the general question of motor cycling for ladies, I think a girl has to be careful as to the exact type of motor cycle she purchases, as it is unwise to get a high-powered machine in the first instance or one with a heavy and awkward frame. Mine is perfectly satisfactory, but without *The Motor Cycle* I should have been at a loss when I first had a motor, and even now it is very helpful in difficulties which are apt to arise.

The Question of Dress.

Then, of course, there is the never-tiring question of suitable dress. I wear an ordinary walking skirt which has three buttons at the bottom in the front and three at the back, which I unfasten when riding and button up for walking. A short mackintosh coat and close fitting cap complete an admirable motor cycling costume. I also wear very high riding boots and driving gloves. Of course there is and has been quite a lot of discussion about dress for the motor cycle, but I have always found mine very suitable and comfortable. I might mention that my machine is a gentleman's model, as I think the various ladies' motor cycles are awfully heavy looking, and, after all, it is just as easy and simple to ride a low diamond frame—at least I find it so.

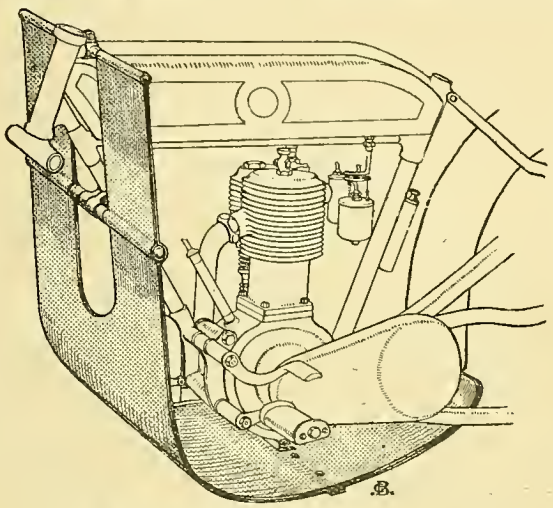
Shields Instead of Mudguards for Military Machines.

Suggestions for a Much-needed Improvement.

By H. Mortimer Batten.

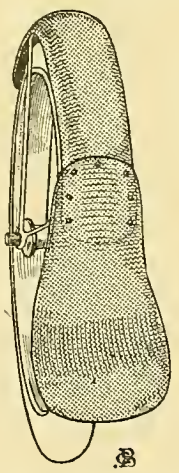
CONSIDERING how much despatch riders in France had to say last winter regarding the inefficiency of mudguarding, it is rather surprising that those responsible have not, apparently, deemed it necessary for any extensive alterations to be made in the mudguarding of stock machines now going over to France. It is true that slight improvements have been enforced, but no serious effort has really been made to adapt the machines to the strenuous conditions of winter warfare.

Last winter it was amply proved that the mudguarding of the ordinary touring mount was not only inadequate but quite wrong in principle; in fact, it was made clear that mud *shields* rather than mud *guards* would best meet the demands. Riders stripped the mudguards from their machines, and improvised crude shields of one kind and another to take their place, and there is no doubt that wide, flat shields, which could be stripped from the machine by the loosening of a nut or two, and clipped back into place just as simply, might profitably take the place of the front wheel guard for military use. For while providing not only the machine but also the rider with shelter, such an arrangement could not "make up," and, being attached to the frame, would not be so likely to rattle loose through engine vibration at high speeds.



Mudshield designed to protect machine and driver.

Now the adapting of a suitable shield would be a comparatively simple matter compared with the designing of an efficient wheel guard. Take, for example, the P. and M. leg shield; this simple and obvious device not only keeps the rider warm and dry, but on the vilest of roads it protects the whole of the power unit from spray and splash caused by the front wheel. A device of this sort certainly fills the bill, but it needs to be extended both under the engine and upwards towards the handlebars. If this were done the front wheel mudguard, if so designed as to stop splash and the spray from the brake block (which, by the way, is more trouble than its existence warrants), might be cut off short on a level with the bottom of the air space in the shield.



Short front guard with extended leather flap.

The advantages of such a system are more or less obvious. We are given a fixture which is permanently a part of the frame, and the front wheel mudguard, now covering perhaps one-third of the circumference of the wheel instead of one-half, would not be so likely to make up with mud, since it would have no vertical inner surface on which the mud could rest and accumulate. It is to be noticed that when a mudguard "makes up," the jam first occurs an inch or so below that portion of the guard on the same level as the axle of the wheel, for at this point the mud falling back towards the road on the inside of the guard is met by a constant stream of mud attempting to travel in the opposite direction, while the rivet heads of the mudguard stay form a convenient anchorage. The short mudguard would allow the mud to drop out, therefore, ere the jamming point was reached, and for the same reason jamming in the vicinity of the forks would not occur so readily if the guard were thoughtfully designed.

Further, the shield does what the widest of guards cannot do: it provides the rider with shelter from wet and cold, and protects the whole power unit from mud and water, while it does not upset the steering of the machine in a high wind. Another advantage of the short wheel guard is that it cannot foul the ground when the machine is pushed or ridden through deep mud, and, finally, if offers a degree of accessibility impossible to attain with the present standard fittings.

Possibly the greatest point in favour of the shield system is in its solidity. The breaking and rattling loose of mudguards are features which are difficult to overcome, whereas with the shield we have a solid contrivance attached to a portion of the machine which is not subjected to great rattling strain.

Now produce this wide, flat shield under the machine to the point at which it meets the back wheel mudguard. This can be done without appreciable loss of ground clearance, and it will be seen that rider and engine are now completely protected from all splash except for that thrown by the back wheel, which is

Shields Instead of Mudguards for Military Machines.—

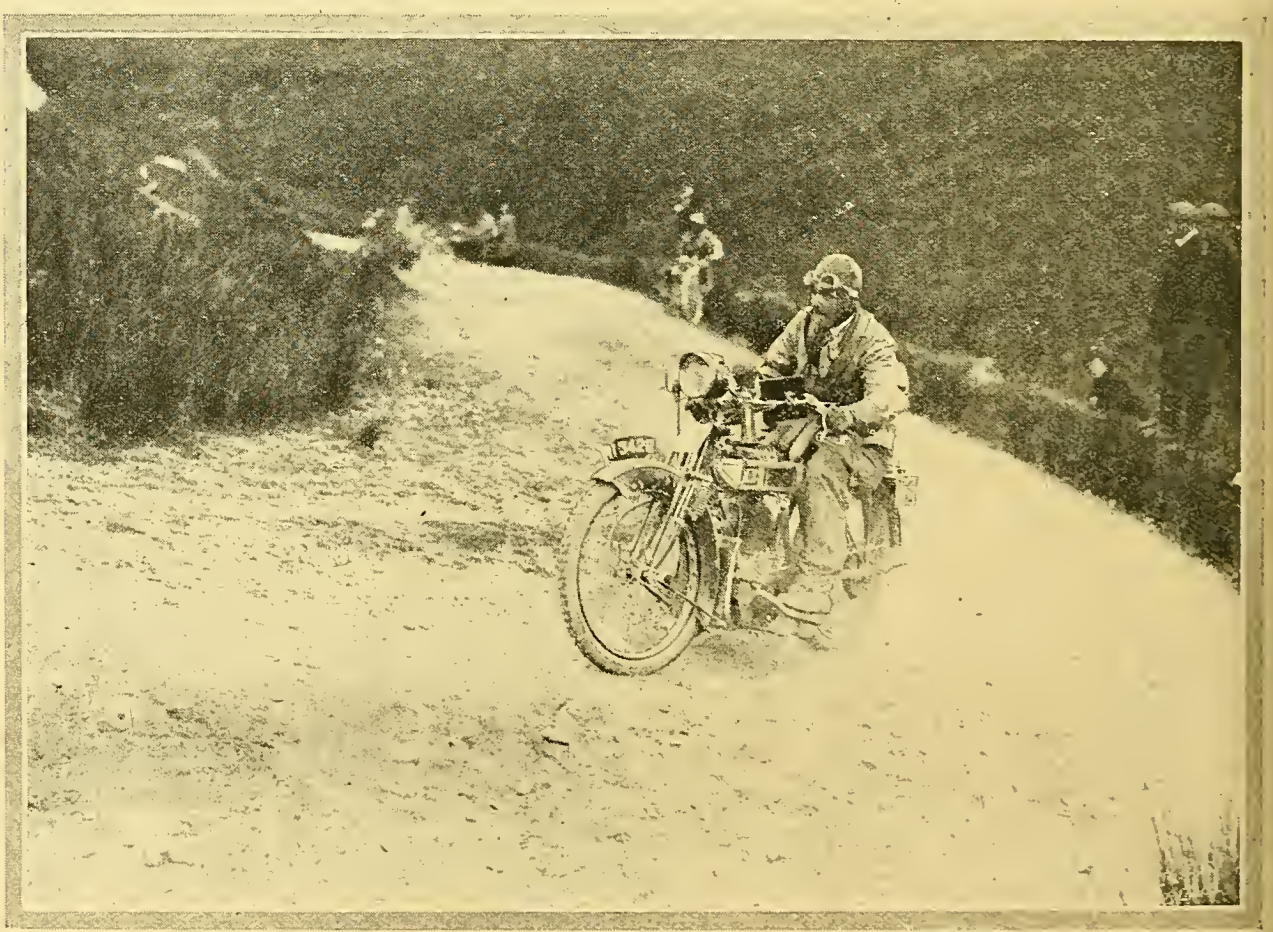
not considerable. The nooks and corners about the silencer and crank case cannot collect great clods of earth, the removal of which necessitates the use of a coal pick, while rear wheel brake control, magneto, and on some machines the kick starter, obtain an equal amount of shelter. The smooth surface of the shield shakes clean, since it provides no point of anchorage for the accumulation to begin.

Regarding the enclosing of the back wheel, there is, perhaps, no great ground for complaint, most manufacturers having abandoned the narrow, winged guard, made to the curvature of the tyre, for the wide, almost flat, shield so obviously superior.

Use Before Ornament.

I do not pretend that the system described, which is put forward merely as a suggestion, would be highly ornamental with its freakishly short guard, but it would be infinitely more businesslike and more suitable for military or colonial machines than the present system. Each season we have perceived the enclosing process produced one stage further, and it cannot be doubted that in due course we shall find all the nooks and corners of the power unit entirely shielded from road contributions, while it is not unlikely that the cylinder itself will be protected from rain by detachable wings hinged to the underside of the tank, which will concentrate the draught on to the engine and shield the legs of the driver from oil and the fine spray from the valves. Such an arrangement, similar to the early Motosacoche idea, but produced several steps further, would prevent the rattle of the engine from rising up into the rider's face, while it would mean a cooler engine and immunity from sparking plug troubles in wet weather. Proper protection would tend to make the pastime infinitely more popular, and, after all, there is no particular reason why the vitals of the machine should be exposed to the weather and the world.

The objection to shields is, we are told, that they are apt to rattle when the machine gets old, but this is because they have hitherto been designed on such slip-shod lines that nothing else could be expected. They are by no means ugly: is not the 1915 twin Sunbeam one of the most handsome machines on the road to-day? The wide shields give the finishing touch in the way of luxurious appearance, and, if you doubt their value, try them (if you are lucky enough to get the chance) on the first wet day.



A NOTED IRISH TEST HILL.

The photograph was taken in the Irish twenty-four hours trial, and shows J. C. Cunningham (4 h.p Bradbury) tackling Glengesh Hill—considered to be the steepest and most difficult hill in Ireland. It resembles Amulree Hill in Scotland

Town & Country

¶ No surface comes amiss to a Bates-built tyre. The smooth, slippery, setts of the city—the flinty, rough, lanes of the country side—are ridden in perfect comfort and security. A firm grip of the road, with almost complete immunity from puncture, and an extraordinary freedom from shock and vibration, are assured to the man whose mount is shod with Bates-built.

"The tyre of no regrets."

I have ridden several machines in the past twelve years but have never had one which gives me so much satisfaction as the

QUADRANT Combination.

Its even running is really remarkable and proves the sound way the Quadrants are built.

I have now ridden 427 miles since I left your factory, and it has never caused me one moment's anxiety. I have had no occasion to adjust any part, which is another proof of the Quadrant's sterling quality.

Those words were penned by an enthusiastic Quadrant rider — E. P. D., of Thornton Heath.

You, too, will share his enthusiasm if you ride the "query-less Q," for its service is always sure and none of those irritating "unexpected happenings" will ever mar the full enjoyment of the Tour.

Ask for particulars of our several models, including the **4¾ h.p. Sidecar Combination with B.S.A. Countershaft three-speed gear—£66 11 0.**

A NEAT DIVIDED SKIRT.

LADY motor cyclists will be interested to see the accompanying illustrations of a divided skirt, which is an eminently suitable garment for those who enjoy the sport and pastime of motor cycling. According to a well-known lady motor cyclist, the divided skirt illustrated, which is the design of Mr. Harrison, of 41, the Grove, Hammersmith, W., has very marked advantages over other designs which have been hitherto used by the fair sex. It is neat in appearance, and has a close resemblance to the ordinary walking skirt, and it may be worn in the house or street with comfort. The skirt is made rather short, with useful pockets at the sides, and is finished with a well cut high waistband, which is fastened with two plain brass buckles. It will not blow about when the wearer is mounted on her machine, and there is no exposure of the limbs when mounting or dismounting. The garment, which should be ideal for use on both open and diamond frame motor cycles, is made in duck back cloth; this the maker guarantees as quite waterproof. It can also be had in gabardine, covert coating, or serge

The Harrison divided skirt, showing neat appearance presented by wearer, both on the machine and off.

A STORY FROM AUSTRALIA.

Here is a striking story from *The Motor in Australia*. Henri Meyer was a racing cyclist. He was a German, but had spent twenty years of his life in France, and could speak French like a native. Also, he had begun to look more like a Frenchman than a German, and disguised as a French sergeant-major he seems to have had a successful career as a spy. His method was to enter the lines and represent himself as an officer belonging to some other division (the one whose whereabouts he wanted to discover for his officers) and enquire how to reach this corps. All went well until he ran into a party of Australian motor cycle despatch riders, some of whom had raced with him on the track. Someone called out, "Hello, Meyer, what are you doing here?" His yarn was unconvincing to men who personally knew him. He was then found to have incriminating German passes concealed in his clothes. He was shot as a spy.

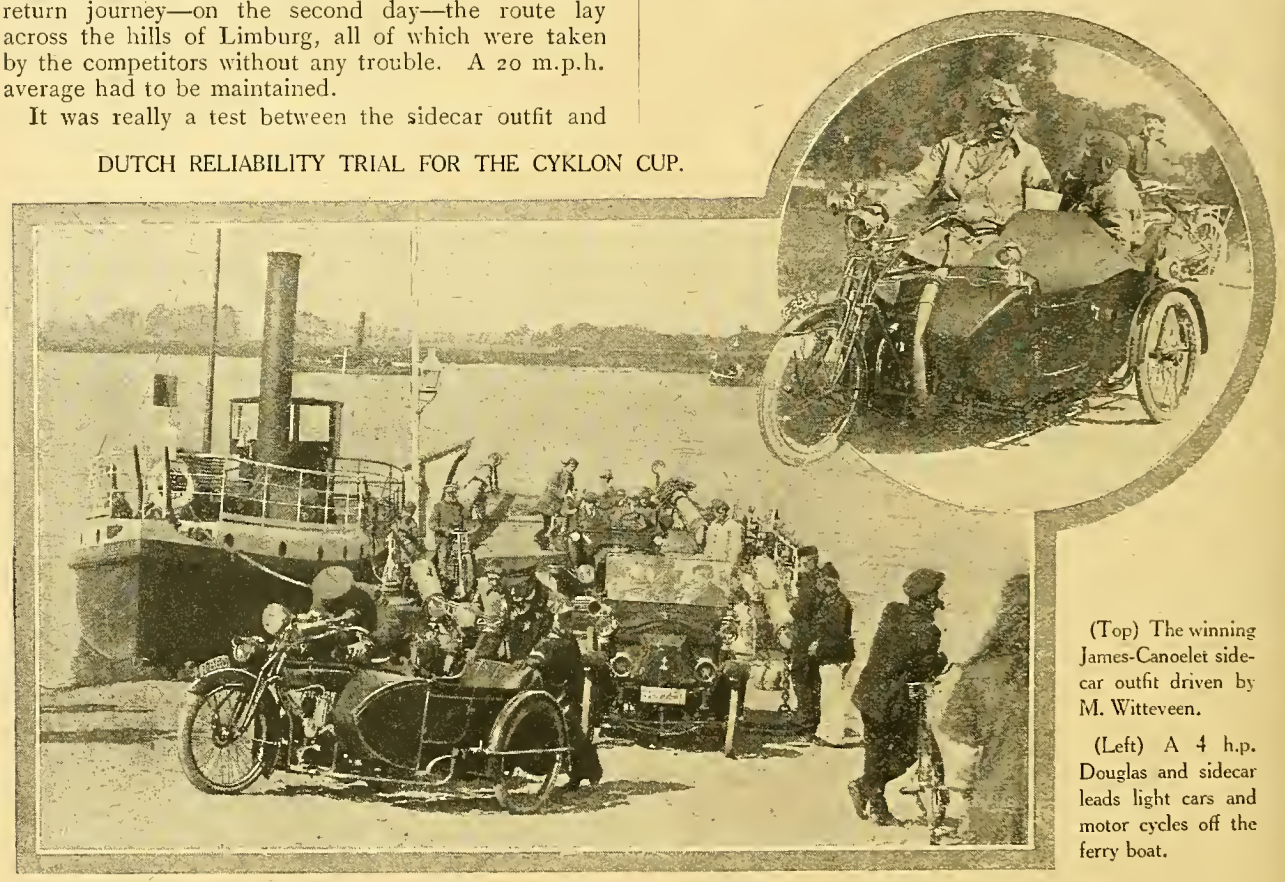
DUTCH TRIAL FOR PASSENGER MACHINES.

British Sidecar Outfit Wins. Contest for Light Three and Four-wheeled Vehicles.

ON September 11th and 12th our Dutch friends ran the final contest for the Cyklon Cup. It was a reliability trial confined to sidecar outfits, three-wheeled cycle cars, and light cars, and the total distance amounted to 325 miles. The route was from Amsterdam to Maastricht and return, and on the return journey—on the second day—the route lay across the hills of Limburg, all of which were taken by the competitors without any trouble. A 20 m.p.h. average had to be maintained.

It was really a test between the sidecar outfit and the cycle car, and both the reliability and economy of running were taken into account, also the condition of machines at the finish. A few British machines were entered, and it is gratifying to know that one of them brought home the winner, *i.e.*, M. Witteveen, on a James sidecar outfit. There were eleven starters.

DUTCH RELIABILITY TRIAL FOR THE CYKLON CUP.



(Top) The winning James-Canoelet sidecar outfit driven by M. Witteveen.

(Left) A 4 h.p. Douglas and sidecar leads light cars and motor cycles off the ferry boat.

ULSTER HILL CLIMB.

Handicap Competition Run in a Thick Fog. A Win for the Douglas.

THE Belfast and District Motor Cycle Club wound up a season that has been a very active one with an open hill-climbing handicap on Saturday last. The event was held at Red Brae Hill, Carrickfergus, where a straightaway hill of a mile and a half in length, with a considerable portion of single figure gradient, gave a very sporting course for the event. The entry for the climb was not a very large one, and a dense fog that settled down on the hill before the start of the proceedings made things rather uncomfortable for the competitors, but fortunately it was not sufficiently thick to make speed dangerous.

The handicap for the climb was made by the Ulster Centre of the Motor Cycle Union of Ireland, and the event was decided on the "knock-out" principle, the men being despatched in pairs. J. Shaw, on a 3½ h.p. Norton, was the scratch man, but he had the misfortune to get away badly in the semi-final, and was not able to give 26 seconds to T. Stewart (2¾ Douglas). The latter also won the final rather easily from D. Hunter (3¾ Scott).

The following qualified for the semi-final: J. Maxwell (3½ Norton), 7s.; D. Hunter (3¾ Scott), 11s.; J. Shaw (3½ Norton), scr.; T. Stewart (2¾ Douglas), 26s. Semi-final: Hunter beat Maxwell: Stewart beat Shaw. Final:

		Start.
1.	T. Stewart (2¾ Douglas)	26s.
2.	D. Hunter (3¾ Scott)	11s.

GRAND PRIX AUSTRALIA WON ON WAKEFIELD 'CASTROL'

Read the opinions of the winner — Mr. J. E. Meller—and those of his brother concerning "Castrol" as a lubricant.

5, Cairo,
North Sydney.

Messrs. C. C. Wakefield & Co.,
Cheapside, London, E.C.

Dear Sirs,

It gives us much pleasure in stating we have used your Castrol Oil for the past two years.

We have used it exclusively in our racing and reliability trials and successes, and on every occasion it has given us utmost satisfaction.

Yours faithfully,
J. E. & F. MELLER.

Advance Australia C.O.C.

Advance Castrol

During the past two seasons these well-known racing cracks have captured the principal motor cycling contests "down under."

C. C. WAKEFIELD & Co.

Wakefield House, Cheapside, London, E.C.

In answering this advertisement it is desirable to mention "The Motor Cycle." B3

ROYAL ENFIELD
MADE LIKE A GUN

Even American Automobile Engineers,

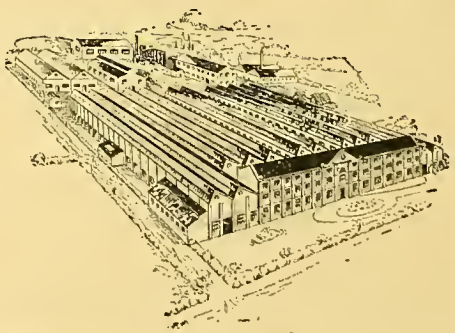
men who design and build machines in their own country, buy Royal Enfield motor cycles. Only a few days ago a leading engineer from Detroit—America's great automobile producing city—called at our works before taking ship for home. Over here on a holiday, he had searched around for the best motor cycle and sidecar combination. Ultimately, his choice rested upon a 6 h.p. ROYAL ENFIELD, and after a road test of over 1,000 miles he was proudly taking his purchase back with him.

That is one of the finest compliments ever paid to Royal Enfield motor cycles.

Complete catalogue of all Royal Enfield motor cycles free on request. Mention "The Motor Cycle" when writing.

The ENFIELD CYCLE CO., LTD., Redditch,
and 48, Holborn Viaduct, London, E.C. Agents Everywhere.

Contractors to His Majesty's Government, the Belgian Government, and the Russian Imperial Military Authorities.



In answering this advertisement it is desirable to mention "The Motor Cycle."

"THE MOTOR CYCLE" RECRUITING SECTION.

Excellent Response to Appeal for Recruits. Three more men from South Africa.

MOTOR MACHINE GUN SERVICE FULL UP.

THE training centre of the Motor Machine Gun Service is full up, and it is unlikely that there will be further vacancies for motor cyclists or cyclists for some weeks to come. At the invitation of the Commanding Officer, Lieut.-Col. R. W. Bradley, the editor of this journal paid a visit to the camp last week, and saw the men busily engaged in the different phases of their training. It was remarkable how quickly the men had taken up their new duties. The camp is situated in an ideal spot, and there was a broiling sun on the day of our visit.

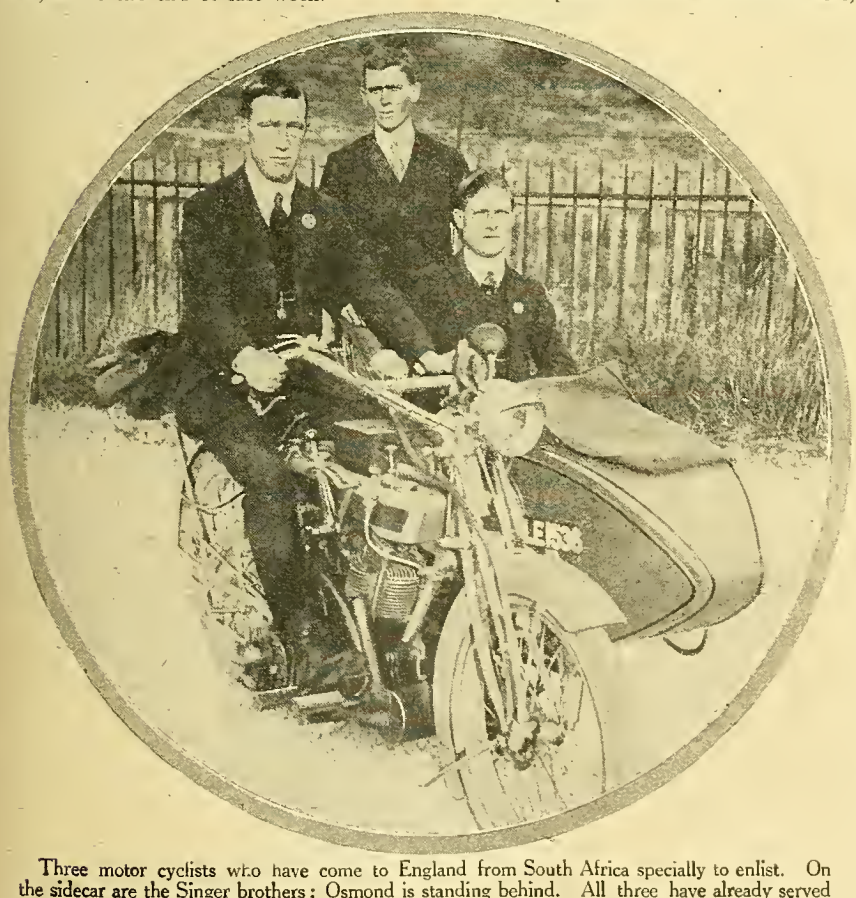
R.E. DESPATCH RIDERS.

MOTOR cyclists all over the country sent for particulars of the above Service to the Editor, though it was clearly stated last week that there are inspecting officers for despatch riders in most districts. As far as possible particulars have been issued to applicants, and the name and address of the nearest inspecting office furnished.

The number of applications from recruits dealt with by Mr. Geoffrey Smith, editor of this journal, had grown to 4,028 at the end of last week.

TWO GALLANT SOUTH AFRICAN MOTOR CYCLISTS.

WE recently had a visit from Regimental Sergeant-Major Harold Singer, who, with his brother (of the 2nd Durban Light Infantry), has come over to enlist in the Motor Machine Gun Section. Singer was in the Garrison Artillery at the start of operations in South-West Africa, but at Luderitz he joined the South African despatch riders, and was attached to General Botha's staff. The Triumph which he rode behaved extremely well, and he could ride for hours at a time on the low gear (14 to 1 Sturmey-Archer) through the thickest sand, against which the smaller machines were of no avail, as their tyres did not present sufficient gripping surface. Evidence of the wonderful organisation prevailing throughout the campaign is the fact that Singer never ran short of petrol. Every depot and communication post had a case or more, and the majority of the transport waggons carried it. It is one of those important details that were properly attended to, and, in a country like that in which the South-West African campaign was brought to a successful conclusion, it is no mean achievement. It is indeed splendid of these two brothers, who were accompanied by a chum Osmond, after "doing their bit" in South-West Africa, to come over to the Old Country to re-enlist, and, as our readers know, they are not the only men from South Africa to do so.



Three motor cyclists who have come to England from South Africa specially to enlist. On the sidecar are the Singer brothers; Osmond is standing behind. All three have already served in the German South-West African campaign.

ROYAL FLYING CORPS.

THE response to the paragraph in last week's issue referring to vacancies in the Royal Flying Corps for motor cyclist despatch riders was remarkable. The R.F.C. is a very popular section with sporting men, and it is, therefore, not surprising that more than sufficient applications were received to satisfy immediate requirements, and, consequently, no more applications should be made until the appeal is renewed. All those who filled in the form in last week's issue should have received instructions by this time as to their procedure. All recruits for the R.F.C. must be finally approved by headquarters after passing a riding test and an examination in their knowledge of a motor cycle. Some applicants had had very short experience of a motor cycle, and could hardly expect to be accepted for the R.F.C.

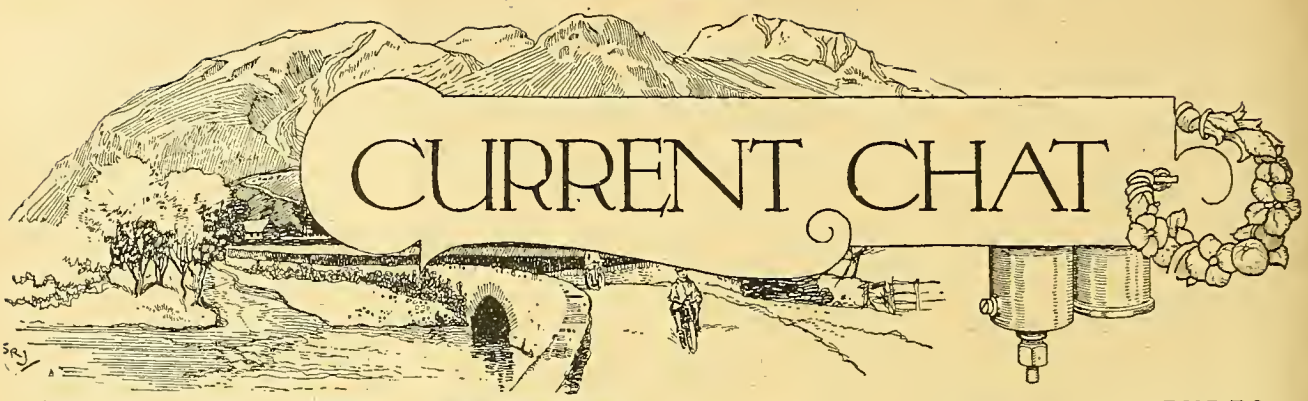
THE MILITARY MOTOR CYCLE IN FRANCE.

A WELL-KNOWN motor cyclist who has had many opportunities, in his capacity as driver of a motor ambulance, of observing the manner in which motor cycles stand up to military work in France, has favoured us with his views on the subject. From these it would appear that the ideal military machine is still to be devised, though the great majority of those out there are, under the trying circumstances, standing up remarkably well. Of course, different makes have their own particular weaknesses, but engines throughout, generally speaking, give no trouble. This speaks well for the design and workmanship, as it is not unusual for water-cooled oil only to be obtainable, and this is burnt away very quickly.

Our informant emphasises the great need for rear springing. This will be well understood by even those at home, and out there many riders suffer severely from fatigue due to excessive vibration. Another interesting point he brings forward is that there is no call for a very fast machine—speed is not so necessary as ease of control, ease of starting, and ability to run slowly to enable the despatch rider to pass safely lorry convoys. For these reasons he considers that there is room for a two-speed lightweight, which should be of very low build and easily controlled. He suggests an engine such as the 2 h.p. Precison, with crank case and gear in one piece.

Tyres should be on the heavy side; 26in. × 2¼in. for lightweights, and 26in. × 2½in. for the ordinary 3½ h.p. machine.

In conclusion, our correspondent says that belts appear to give no trouble, and that a nail catcher is a useful fitment omitted by most makers.



TIMES TO LIGHT LAMPS.

Sept.	23	... ...	6.58 p.m.
,,	25	... ...	6.53 ,,
,,	27	... ...	6.48 ,,
,,	29	... ...	6.45 ,,

In London half an hour earlier.

The Ways of the Army.

A recruit accepted by the Editor last week had to pass simple arithmetic and dictation test, although he was a school teacher and University B.A.

Red Rear Lights on All Vehicles.

We understand that steps are to be taken immediately to enforce the Home Office regulations that cycles and other vehicles should carry a rear red light.

New Use for a Sidecar.

A motor cyclist we know has found an easy method of mowing a big lawn. He simply hitches a good-sized mower to his sidecar outfit, gets someone to guide the mower, and the work is soon done.

Racing in Australia.

A five and a half mile road race was recently held by the Hamilton (Victoria) M.C.C., with the following result: 1, C. Whitford (3½ Rudge-Multi), scr.; 2, J. Quigley (3½ Rudge-Multi). The winner was giving a start of several seconds to powerful American twins.

From the Eastern Counties.

On the Colchester-London road a great many more motor cyclists than motorists are to be seen, the majority being officers attached to the various regiments stationed in the numerous towns in the vicinity. The road is in very good order, and is a safe one, possessing several fast stretches.

Photographing.

Motor cyclists who are photographers should exercise care when photographing on or near the East coast. Recently one of our staff was delayed for an hour while being questioned by an officer of the regiment stationed in the locality, this despite the fact that he photographed quite openly, and after first asking permission of the various sentries who happened to be standing near the photographer. The slight inconvenience caused was nothing serious, and we simply quote this instance as a warning, even when photographs are taken in places where there are, as far as one knows, no objects of military importance, and in which there is no apparent need for secrecy.

Motor Cycle Thefts.

Two privates of the West Riding Regiment, Henry Collumbine and J. Hawcroft, were recently sentenced at Mansfield to two months' hard labour for stealing a motor cycle. They took the machine from outside the Grand Theatre, Mansfield, and rode it to Yorkshire, getting free supplies of petrol on the way by stating that they were despatch riders.

A Good Climb.

We have received information that E. W. Flower, riding a 3 h.p. Enfield and carrying a heavy passenger, recently made the ascent of Mount Troodos (Olympus) in the island of Cyprus. This mountain is 6,000 feet in altitude, and is approached by a zigzag roadway, which, in places, is somewhat dangerous. This is said to be the first ascent of Mount Olympus.

Prominent Trade Man in the R.F.C.

Flight-Commander Frank Smith, whose photograph we reproduce on this page, will be known to many of our readers as the assistant managing director of the Enfield Cycle Co., Ltd. He has already been to the Front, was subsequently transferred to the Royal Flying Corps, and was recently home on leave. Flight-Commander Smith is one of the many motor cyclists in the Flying Corps.

MOTOR CYCLISTS IN THE ROYAL FLYING CORPS.
Flight-Commander Frank Walker Smith, assistant managing director of the Enfield Cycle Co., Ltd.

SPECIAL FEATURES.

SHIELDS INSTEAD OF MUDGUARDS (Illustrated).

A SUGGESTED COMPETITION FOR MUNITION WORKERS.

THE PEN-Y-BALL HILL-CLIMB (Illustrated).

A Lancashire Road Puzzle.

Correspondents so far agree with us that the more direct route from Warrington to Preston, viz., *via* Wigan, is preferable to the R.A.C. avoiding route. A Liverpool correspondent objects to our reference to "cobblestones" on this route.

Probably the Lightest Four-wheeler.

A Beverley, Mass., agent has built a very light four-wheeler with cycle wheels and tyres, and attached an Auto-wheel. It is driven about the streets for advertisement. The whole outfit, we understand, does not weigh so much as a motor bicycle.

The late Mr. J. H. Cocker.

We regret to record the death of Mr. J. H. Cocker, the Northern Counties representative of the Enfield Cycle Co. Mr. Cocker was well-known to T.T. riders, and used to look after the Enfield competitors in the Isle of Man.

A Coloured Head Light.

At the Moot Hall Police Court, Newcastle, a motor cyclist was recently summoned for riding a motor cycle which displayed a blue head light. He was ordered to pay the costs. It was pointed out that according to the Act the head light should not be coloured—a fact of which few people seem to be aware.

A Competition for Munition Workers.

A competition for motor cyclists engaged on munitions is the latest suggestion by a reader of *The Motor Cycle*. We deal with the matter editorially. It would be easy to limit the event, if held, to war workers by stipulating that all entrants must be in possession of the official war badge.

Second-Lieutenant Lodge Killed.

Our readers will be sorry to learn that Second-Lieutenant Raymond Lodge, the youngest son of Sir Oliver Lodge, and associated with the Lodge Sparking Plug Co., Ltd., has been killed in action. He was twenty-six years old, and was attached to the South Lancashire Regiment, which he joined just after the outbreak of the war.

A Curious Fact.

In contradistinction to the Army and Navy meetings held at Brooklands, when practically every official was an Army and Navy man, not a single official announced for the Army *v.* Navy hill-climb on Saturday is attached to the Services.

The Army v. Navy Hill-climb.

We have received the following particulars regarding the hill on which it is proposed to hold the Army *v.* Navy hill-climb, starting at 2 p.m. on Saturday next. The length is approximately 1,000 yards. The maximum gradient is 1 in 8 near the start, afterwards easing to 1 in 20. The surface is excellent. The name of the hill will be found on the notice board of the Streatham and District M.C.C., which is organising the event, at the Crown and Sceptre, Streatham Hill, on Saturday morning. The committee of the Streatham and District M.C.C. will present a silver cup for the best performance on formula of a member of this club.

NEW TAXES ON CARS, MOTOR CYCLES AND PETROL.

In the House of Commons on Tuesday afternoon, the Chancellor of the Exchequer outlined the following new taxes on motor cars, motor cycles, and motor spirit.

Motor spirit: 3d. per gallon.

Motor cars, motor cycles, } Duty of 33⅓% ad valorem.

Liverpool Club's Hill-climb in North Wales.

The photographs in this issue of Saturday's Pen-y-ball hill-climb are exclusive to this journal as usual. It is amusing to observe that a contemporary publishes a single and very old photograph of a Pen-y-ball hill-climb, but the bare trees in the background look very cold, and suggest another great journalistic feat which may yet be described as the first illustration of autumn "leaves."

The Testing of Metals.

The final instalment of "The Testing of Metals" will appear next week.

Average Prices

We give below the average prices for the various second-hand models offered for sale in *The Motor Cycle*. We quote those machines of which at least five weekly averages have appeared in the past two months, and where it is possible to obtain a sufficient number. We give the average for the past week.

Make.	Year.	H.P.	Last week's average.	Average for past 8 weeks.

Among the steadily increasing number of ladies who are taking up motor cycling are many of the theatrical profession, and these illustrations show two actresses, Miss Sybil Arundale and Miss Betty Fairfax, out on the road. The lower picture shows that they are not afraid of tackling tyre repairs by themselves.

Entries for Next Saturday's Hill-climb.

At the time of going to press entries had been received from the following for the Army and Navy hill-climb on Saturday next:

C. P. O. Kingston
Sergt. Milner
Flight Sub-Lieut. Openshaw
Capt. G. W. Huntbach
Capt. P. W. Inglebach
Lance-Corpl. Thompson, R.E.
Flight Lieut. Warneford.
Capt. Storey
Lance-Corpl. Wardlow
Lieut. J. Everard Storey
Pte. H. Johnson, A.S.C.
Sergt. Barker, A.S.C.

As entries did not finally close until Wednesday, the above list cannot be taken as being complete.

At the starting point. W. Jones (2¾ h.p. A.J.S.) getting away.

H. W. Coopland (6 h.p. A.J.S. sidecar) nearing the top of Pen-y-ball.

Pen-y-Ball Hill Climb.—

mild diversion was caused at the starting line by Simister's Dot-Jap getting on fire, but it was quickly put out without damage. C. B. Franklin (3½ h.p. Indian) looked all over the winner as he left the line, and his win compensated him for his journey across the Irish Sea.

Few Failures.

Failures on the hill were but few. These were Horsman, as mentioned; J. Moore, who broke his belt within sight of the finish when going well on a Triumph, which gossip on the hill reported as formerly ridden by Jimmy Cocker; H. J. Hughes, whose Matchless mysteriously dried up *en route;* G. Scholes, whose 6 h.p. Bradbury sc. fairly konked out; and two 10 h.p. American Ritz cars, which were only unpacked on the morning of the climb, and were thus not run in or tuned up.

Seen from the steepest part of the hill, with its natural circular grass gallery either side, both being literally covered with spectators, many of the men were noticed to be erratic in their steering, and this was probably due to the water gulleys and the loose surface. Both Newey and Horsman had their stands down, evidently through the jumps over the gulleys. Amusement was caused by the position adopted by the passenger in Bottoms's sidecar, as he was quite out of sight until the machine was alongside, when he was seen to be kneeling backwards face downwards.

A noticeable feature was the large proportion of khaki-clad visitors, particularly officers, whilst in distinct contradiction only one competed in khaki, *i.e.*, Sergt. F. C. Jones, who thus with his Singer light car took the prize awarded for fastest time of the day by a member of H.M. Forces.

Results.

CLASS I.—SOLO MACHINES UP TO 275 C.C. (4 Entries).

1.	W. H. Butterfield (2¼ Levis)	63⅗ sec.	1st Expert & 1st General.
2.	Howard Newey (2¼ Levis)	65⅘ sec.	2nd Expert.
3.	R. Grice (2¼ New Imperial)	67⅘ sec.	3rd Expert & 2nd General.

CLASS II.—SOLO MACHINES UP TO 350 C.C. (6 Entries).

1.	H. Heath (2¾ A.J.S.)	48⅘ sec.	1st Expert & 1st General.
2.	W. Heaton (2¾ A.J.S.)	53⅗ sec.	2nd Expert.
3.	W. Jones (2¾ A.J.S.)	54 sec.	3rd Expert & 2nd General.
4.	O. Wade (2¾ A.J.S.)	54⅘ sec.	
5.	S. Hughes (2½ Sunbeam)	64⅕ sec.	3rd General.

CLASS III.—SOLO MACHINES UP TO 500 C.C. (15 Entries).

1.	C. B. Franklin (3½ Indian)	45⅘ sec.	1st Expert & 1st General
2.	T. Simister (3½ Norton)	49⅘ sec.	2nd Expert & 2nd General
3.	H. Riddell (3½ Precision)	50 sec.	3rd Expert.
4.	W. Heaton (2¾ A.J.S.) / O. Wade (2¾ A.J.S.)	51⅘ sec.	
6.	C. W. Jobborn (3½ A.J.S.)	52⅕ sec.	3rd General.
7.	W. Jones (2¾ A.J.S.)	52⅘ sec.	
8.	E. Hickling (3½ Premier)	58⅘ sec.	
9.	W. Nolan (3½ Rudge)	69⅕ sec.	
10.	C. Hughes (3½ Sunbeam)	74 sec.	

CLASS IV.—SOLO MACHINES UP TO 750 C.C. (10 Entries).

1.	Victor Horsman (3½ Singer)	43⅕ sec.	1st Expert.
2.	T. Simister (3½ Norton)	49 sec.	2nd Expert & 1st General
3.	H. Riddell (3½ Precision)	49⅘ sec.	3rd Expert.
4.	O. Wade (2¾ A.J.S.)	51⅘ sec.	
5.	W. Heaton (2¾ A.J.S.)	51⅘ sec.	
6.	E. Hickling (3½ Premier)	56⅕ sec.	2nd General.
7.	C. Binks (5 Indian)	56⅘ sec.	3rd General.

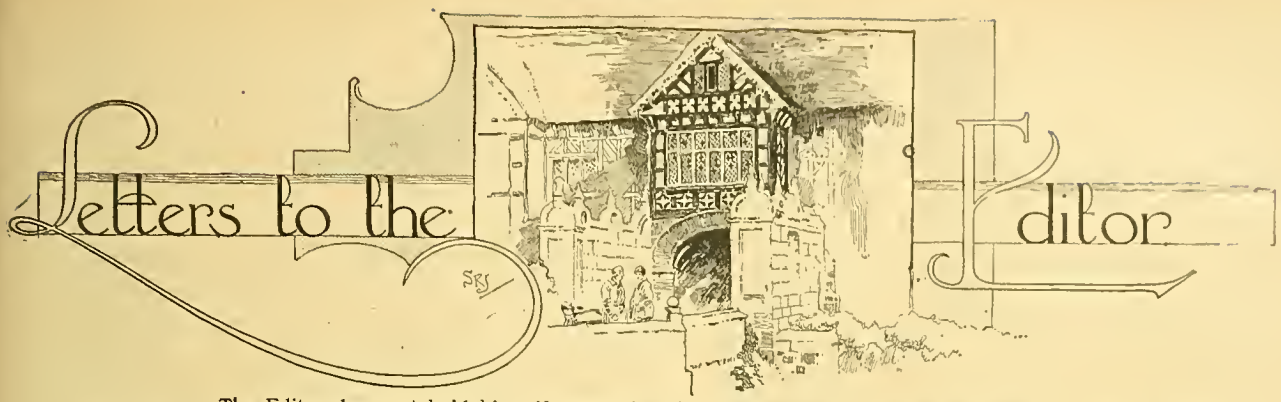
Manchester motor cyclists took 100 wounded soldiers for a run into Cheshire on Sunday last. The photograph shows some of the sidecar outfits with their gallant occupants starting homewards from Kerridge Farm, Macclesfield. H. Reed, of Dot fame, is the marshal on the left in Volunteers' uniform



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A Lady's Record Ride in Lakeland.

Sir,—May I be allowed to congratulate Mrs. Mary Riley upon her wonderful performance described in the last issue. It is a splendid piece of driving, and readily appreciated by anyone who knows the country and the conditions.

I should like to say how much I enjoy the articles from the very able pen of Mr. George D. Abraham, not forgetting the excellent illustrations which accompany his writings, and which have appeared from time to time in your journal.

I rather hoped that in the reference to Three Shire Stone the inscription would be mentioned, which reads, "Lancashire W.F. 1816." I have never been able to find out the meaning. Perhaps Mr. Abraham can enlighten me. Baddeley, in his guide, although referring to the inscription, offers no explanation.

R. HOLFORD JONES.

A Lancashire Road Puzzle.

Sir,—With reference to your enquiry *re* Wigan-Warrington route, I was over both these routes about five weeks ago when going south and returning from Blackpool. Going down we chose the R.A.C. avoiding route, and did not see a single R.A.C. post all the way, but the ordinary posts were fairly numerous. Had we not known, however, that, after Ormskirk, we had to make Rainhill, we should have gone astray, as after Ormskirk there are many signs pointing to Warrington which, I believe, would lead one into the main route before the road *viâ* Rainhill does. On a few occasions, through poor signposting, we had to enquire our way, and, generally speaking, found the roads rather poor, and certainly the route is much longer than the direct one. Coming back the weather was fine, and we decided to risk the through route, which we found very good. I think, on the whole, the road surface is better than the avoiding route, and we certainly seemed to get through to beyond Wigan very quickly. Personally, I think that this route is to be preferred if the weather be fine, and if wet I should choose the other, because the tramlines of the two towns appear badly set, and in grease through the traffic as well it would not be pleasant, to say the least of it. After Wigan towards Preston the road is certainly quite good, and if when entering Wigan from the south one takes the road to the right one can avoid a little more of the actual town of Wigan.

STANLEY WORSNOP.

Sir,—May I point out that this puzzle is entirely of motorists' own making. Every account of a motor trip from Warrington to Preston that I have ever read has contained a reference to "cobbles" or "cobble-stones," and even your article, though based on a recent trip over the road, also refers to "cobble-stones"; so there is no wonder the R.A.C. planned out an "avoiding route." The real fact is that there never have been any cobble-stones on this part of the Land's End to John-o'-Groat's route, and writers seem to have followed one another in perpetuating a maligning description. It has apparently been the proper thing to make mention of cobble-stones when coming to this part of the route, regardless of the fact that they did not exist. No one ever heard of a cyclist attacking the Land's End to John-o'-Groat's record using any other route, and the "R.A.C. avoiding route" is simply ridiculous. From Warrington to Wigan has always been mostly macadam, and even where the tramlines are encountered by Ashton there is a good deal of macadam at the side until Brynn is approached. From Brynn to Wigan is all setts, but setts and cobble-stones are very different things, and the going is really quite good right through Wigan, while, as you point out, most of the macadam now takes the form of Tarmac. There is certainly nothing gained by taking the R.A.C. route, but even if motorists preferred an extra ten miles to avoid the Brynn-Wigan setts the R.A.C. could have planned a much better route from Knowsley through Rainford and Lathom, joining the main Ormskirk road at Burscough Bridge.

W. P. COOK.

Scottish Officers and their Pleasure Mounts.

Sir,—I have just been reading your article under the above heading in the last issue of *The Motor Cycle*, and it has occurred to me that it would be a good plan to hold a meeting like the recent Brooklands contests, or a hill-climb, in Scotland. Is this feasible and practicable? It would be most interesting to us up here, seeing that we cannot get South to attend or witness your shows. I would suggest somewhere near Glasgow or Edinburgh as a suitable place. Of course, you most likely have thought of this before, but I thought I would write to you.

Arder, Ayrshire. A. R. MOWBRAY, Lieut. R.G.A.T.

A Competition for Munition Workers.

Sir,—We have had an All-khaki and a United Services race meeting, and I would like to suggest that an event of a similar nature be organised for the workers behind the scenes—that is, the hard-worked munition workers, among whom are some well-known motor cyclists.

I would suggest that the event take place one Saturday afternoon in some convenient part of the Midlands, where most of the workers are to be found, and that it should take the form of either a hill-climb or speed trials, and, lastly, that the organisation be carried out by *The Motor Cycle*. All entrants should be on War Service, of course.

I should be glad to see something done to relieve the monotony of the war workers, and I feel sure that such a meeting would meet with success.

E.T.E.

[We deal with this suggestion in a leading article.—ED.]

Spring Frames in 1906.

Sir,—I noticed in last week's issue a reproduction of the design of spring frame for which you awarded a prize to Mr. Alfred Scott, of *Leeds*, in 1906, with remarks attributing the same to me, and commenting upon my curious change of opinion.

Upon its first appearance in your paper I foresaw possible confusion later on; but, whilst complimenting the designer upon his award, permit me to affirm the constancy of my views on frame design, and although I rejoice in the same name, and appreciate the charms of the same district, "I deny with both hands" any complicity in the affair.

ALFRED A. SCOTT, of *Bradford*.

[We offer our apology for the incorrect assumption that the two Yorkshire motor cycle designers of the same name were one and the same person.—ED.]

Mind and Machine.

Sir,—I was very interested in the letter and leader on the psychic relationship between man and machine in your issue of September 9th. For some years I have been inwardly convinced that such a relationship does exist, but until reading your correspondent's letter I had regarded the subject as no more than a fancy.

I am of opinion that, besides the sympathy between man and machine, there is a character or temperament in every machine, which varies, as in men. Being a motor cycle tester, I notice such differences in machines of identical form and design, and should like to hear the opinion of other readers more able to speak with authority and experience than myself. I have noticed in many cases that a man's temperament is reflected in the machine he rides and the results he obtains from it. This may be definitely due to some material cause. TESTER.

Sir,—I am not prepared to admit the contention put forward in your "leader" (issue, September 9th), and in the excellent letter by your correspondent "M.S." (issue, September 16th), that, before we can seriously consider the psychic relationship between mind and machine, we must prove the existence of an "anima" or consciousness inherent in the mechanism. The theory of such a consciousness, though defensible, is not required by the argument. It is through direct association with the human mind that the engine can apparently display sensory attributes, and then only when set in motion. Thought itself is a phase of motion, and, by reason of its dynamic affinity with other phases of motion, not necessarily animate, it can transmit the phenomena of sensation and will to a piece of running mechanism. Such transmission is purely impersonal and must be classified with the subconscious activities of the mind, termed by psychologists "automatic."

No doubt the structural peculiarities of a given engine modify the action of this imparted consciousness, and we may thus refer to mechanical temperament and almost admit a moral distinction between one engine and another. The point to be borne in mind is this, that the rider does not of necessity establish an affinity between himself and his machine since the initial process of sensitising the mechanism is automatic, and the condition of sympathy is dependent on reciprocating qualities which may or may not be present.

Thus, the influence of the machine on the conscious mind presents a problem of the most complex nature, being partly reciprocal and partly suggestive.

Two points to be remembered are—(1.) That sensation and thought are states of motion. (2.) That transmissive sensation is impersonal, and is related to those forces which regulate matter and motion of which we have as yet a very limited knowledge, hardly more than speculation.

C. E. VULLIAMY.

Sir,—We now have news indeed: "a psychic relationship may exist between the rider of a motor cycle and his engine, or, indeed, between the human mind and any piece of running machinery." This were matter for the Royal Society, scarcely for motorists. It is far above our heads.

That a sort of sympathy (a much misused word) may exist on the part of the driver towards an engine which, obedient to careful manipulation, gives him little trouble and good service, is perhaps not impossible. More than one has spoken to his machine almost in loving words when it carried him faultlessly up hill and down dale to see one who was to become his wife, and also, at another time, when the same good old bicycle as faultlessly brought the doctor in a desperate hurry. Yet, in all seriousness, there was nothing like the psychic relationship between the machine and the man as there was, later on, between the man and the dog found licking the hand of his child it had brought from the water. Yet, has a dog a soul?

The influence of mind on machinery (without mechanical intervention) may be an interesting subject—indeed it is—though one which requires studious graduation from the mind itself. Psychic relationship is not fully established between humanity and other living forms downwards to the lowest form of animal life. Even when established, there is a further vast field for research in that other form of life—vegetation, again through a long line down to the verge of that form of matter understood by the mind to be inanimate. All this appears to be necessary before psychic relationship between mind and machinery can be successfully or reasonably studied. The gulf at present is too great. If the terms animate and inanimate have meaning, it is probable that a mollusc, diatom, or seaweed has a greater chance of psychic relationship with humanity than a motor cycle engine. Has seaweed a soul?

When the materialist, on the one hand, informs a gasping world that an animal feels no pain, that the cringing nervousness exhibited and the howl or other vocal noise is merely reflex action; and the psychologist, on the other hand, informs the world that the cry of a slipping clutch is not the noise of misused metal, but is the voice of pain, some latitude must be allowed to the normal individual who gives little credit to what he cannot understand—mistake or no mistake.

Prophecy, too, is apparently one of the psychologist's weapons for putting the ordinary individual to flight. "A sensitive motorist is aware of what is going to happen in the engine before obvious symptoms declare themselves." This, indeed, is a branch of study worthy of development to that stage of foresight when one would carry only the particular spares required for the prospective journey.

Mentality is a wonderful thing, and one of its peculiarities is that when it has not followed throughout the proper course of thought, it considers that other things have attributes foreign to their nature. If a sound, the cry of a night bird, the scent of an unseen flower, the flicker of a distant light, though unconsciously or subconsciously received by the mind, will (particularly in a state of loneliness) commence a train of thought or recall the memory of something, to that moment forgotten, so by a similar process the merest trifle, happening to the engine an appreciable time before obvious symptoms occur, may bring the mind unconsciously towards the conclusion which experience has taught it. There is no psychic relationship in this. In simple language, both wanderer and motorist wake up in the middle of the mental process.

The materialist and the psychologist cannot be both right. If it be true that you may kick your dog as much as you like because reflex action has taken the place of pain, and yet when the bicycle begins to spit and cough you must sympathetically place a wet compress round its dear little throttle—murmuring sweet nothings the while—'twould seem that the reign of terminological inexactitude were well-nigh established. One would rather imagine that any stage of mood or mind between tender sympathy and violent thought would not avail in running if the petrol lever be turned off; but apparently the average motor cyclist does not properly understand things.

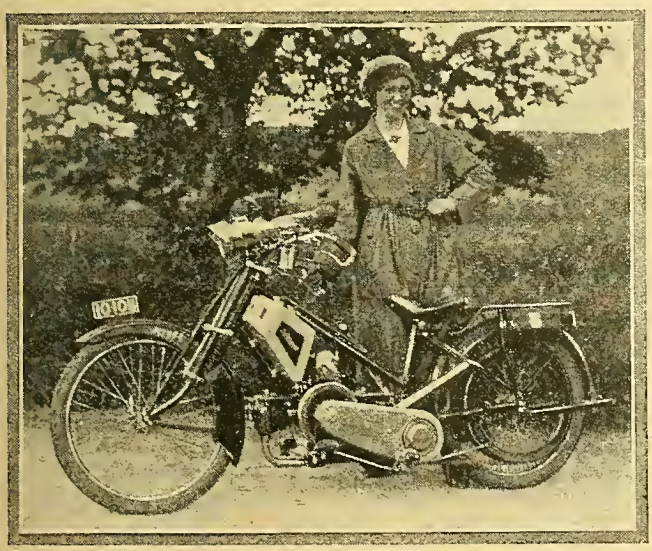
Poetical metaphor, whether rhyme or prose, is often a misuse of words—comforting, no doubt, but it is the veritable *bête noire* of reason. The statement "The cry of a slipping clutch is the voice of pain" is not wonderfully different in its inexactness from "The occupant of the sidecar is the fairest lily of the field."

S. McCLELLAND.

Capt. G. W. Huntbach, of the M.M.G.S., with the 3½ h.p. Premier on which he tied for first place in the 550 c.c. hill-climb at the Brooklands United Services meeting. This machine, which is fitted with a Philipson pulley, he expects to ride at the Army and Navy hill-climb on Saturday.

A Lady's Praise for her Mount.

Sir,—I have pleasure in herewith sending you a photograph of my 1915 lady's model 3½ h.p. Brough. As can be seen, it incorporates many excellent features. The frame is open, which is the important item, as a lady must look neat and graceful when mounted; it is also strong and rigid. In fact, the machine may be termed the Rolls-Royce of ladies' mounts, and if any other owner or maker think he has a right to this term I shall be glad to hear where he can supersede the Brough, and in what respect. The engine is of the horizontally opposed type, with overhead valves, and possesses a tremendous reserve of power, this being apparent at the first touch of the throttle. I have already had the speedometer touching "52," but this is not where the Brough scores most from my point of view. It stands alone because of its really comfortable riding position and ease of starting—just one push of the kick starter and you have it every time—it is minus vibration, and the engine will pull as steadily through the traffic at 8 m.p.h. on top as it would do at 20 m.p.h. What a vast difference there is on this up-to-date model compared with some of the "old-time gallopers" which I have had to pilot in the earlier days. Hills which I used to term the real Scotch terrors are not observed with the Brough, which roars to the summit and soon leaves everything behind. The three-speed Sturmey-Archer gear box is fitted, which with cork inset clutch and kick starter forms a complete unit. The clutch is controlled from the handle-bar; it works excellently, and does not "grab" when engaging.



Miss Mary Reid and her twin-cylinder Brough.

I am sure there must be many readers who live also in hilly districts, who would be glad to know that such a powerful model for ladies is to be had, with all the latest improvements. In fact, I am very much disappointed that the makers always seem to forget to talk to the ladies in the advertising columns; but we will excuse them, as we know they are doing their bit making the bombs to bring us back to the good old peaceful days.

(Miss) MARY REID.

American Design.

Sir,—It was with considerable interest that I read "The Trend of Design in America" as viewed by a "British Motor Cyclist."

American machines are built as they are for certain reasons, and very good reasons, too, and some of the improvements that seem to be lacking on American machines are left off for reasons known to the manufacturers only.

The average machine as produced in the United States has an engine of 1,000 c.c., which must pull a weight of some 500 lb. (allowing 150 lb. for a rider) on a top gear of 3¾ or 4 to 1. On these gears the machines in ordinary road trim, or all on, will do 65 to 70 m.p.h., and, what is more, they will hold a fairly rough road at high speed. This road-holding ability is the result of a big heavy machine having 28in. wheels and 3in. tyres, extremely efficient front forks, and some sort of rear spring, either for the rider or for the whole machine. On the same gear ratio the machines will, in most cases, throttle down to 5 or 6 m.p.h. without retarding the spark, and at that speed they are nearly, if not absolutely, silent. A good American twin with a two or three-speed gear (bottom gear about 9 to 1) will climb

anywhere with a sidecar where traction can be obtained, and solo stretches of 1 in 2 may be surmounted at speed on intermediate.

Take in comparison to the above an English single or small twin of, say, 500 c.c. The owner of such a machine is naturally anxious to hold his own on the road with the bigger American twins, and he is therefore forced to ride through deep ruts and over some stretches of road where the surface is composed entirely of loose stones two to four inches in diameter. These are all taken at speeds of from 30 to 60 m.p.h., and the unfortunate owner of an English machine, with its small tyres and low footboard clearance, must put up with a lot of rim cutting and stone bruising on his 2¼in. or 2½in. tyres, and in ruts he is continually in danger of spilling on account of his footboards catching on the sides of the ruts. Then again, the average English medium-weight machine has no rear springing other than the saddle, and the rider is jolted about fearfully on comparatively good roads, while on really bad roads it is next to impossible for him to "navigate." His machine has the speed, and a good three-speed gear with a wide range of ratios enables him to go as fast as he desires and climb practically any hill he desires, but if the surface is poor (and it nearly always is) it is impossible for him to hold his own with the heavier American machines.

Mudguarding is a point which has been carefully considered by American manufacturers, and although the American system of mudguarding "leaves much to be desired," it is impossible to make it much more efficient. When it comes to "mud-plugging" it is either necessary for the average English machine to fall out of the running on account of plugged guards, or else remove the guards altogether (which is not a very nice task on a muddy road and in the rain). Lots of clearance and the design of the guards on American machines make it possible to go nearly anywhere without the guards plugging, and when tyre chains are fitted the guards will positively not fill up with mud.

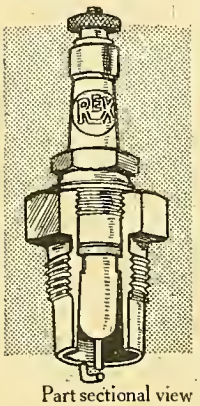
Now, I do not want it said that I am taking a prejudiced view of the subject, for I will admit that in detail work, chain guarding, etc., the English machines "have it on" the American-made machines, also when it comes to obtaining efficiency from a motor of given capacity the Englishman is without an equal, but in order to compete with American manufacturers in countries where the roads are poor or only partially improved it is absolutely necessary that English manufacturers turn out a machine with (1) lots of power and speed, (2) quick pick-up, (3) large tyres and heavy rims to withstand rough roads, (4) some sort of rear springing, (5) plenty of mudguard clearance, (6) a front fork where the action is *back* and *up*, (7) more footboard clearance, and also folding footboards (see illustration).

Calgary, Canada. LESLIE MUNRO.

[Our correspondent's views from the other side are most interesting and instructive. From experience gained in this country, we cannot agree that an American twin in the average owner's hands will take a sidecar "anywhere where traction can be obtained" on a 9 to 1 gear, nor should we care to take a road covered with 4in. stones at 60 m.p.h. on any machine. Nevertheless, the letter gives some interesting pointers to those who are studying the Overseas market. We should be glad to hear if there is any reason for the inaccessibility of many American twins, *i.e.*, the impossibility of removing the cylinders without removing the engine from the frame, etc. Machines with detachable heads (as the Indian) are, of course, exempt from this criticism.—ED.]

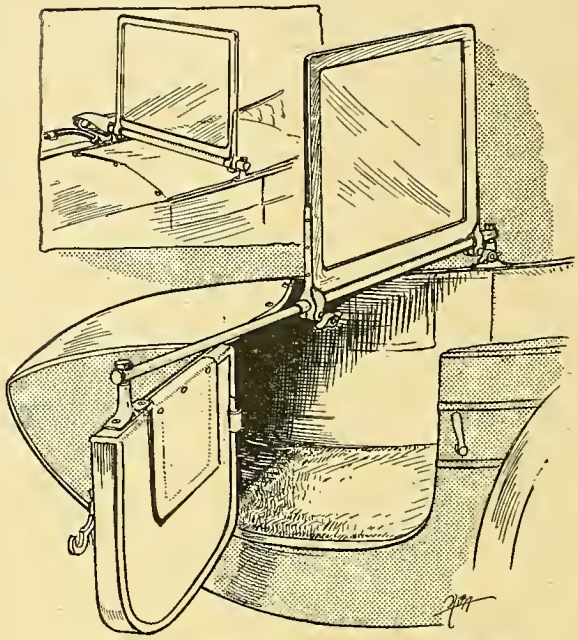
THE REX SPARKING PLUG

THIS is an American production, sold at a moderate figure, and possessing the important quality of extreme durability. The porcelain is of a special type, which is said to stand any amount of heat, while the central electrode is baked into the insulating material, and it and the other electrode are composed of a special alloy of platinum and nickel steel. The plug is easily demountable by removing the gland nut, and spare porcelains can be obtained and fitted without difficulty. One of the chief features is the shape of the porcelain, which is tapered at the point, where the washer is forced down by means of the gland nut, therefore forming a gastight joint. The cap at the top of the insulator is baked on, and is very firmly fixed. The plug is handled by Messrs. Robertsons Motors, Ltd., 157b, Great Portland Street, W., and Mr. Robertson Brown in our presence subjected it to a most rigorous, if not unfair, test. The plug was heated to a dull cherry red by means of a gas blow-pipe, and the whole plug insulator and body were absolutely glowing when it was dropped into cold water. The plug was then taken apart, and the porcelain was found to be absolutely intact, and the brass cap at the top perfectly firm. The plug is claimed by the makers to be oilproof, heatproof, and guaranteed for one year, no matter what mileage is covered in that period. At present it is provided with a thread suitable only for Harley-Davidson motor cycles, but plugs suitable for the standard De Dion thread are in the making.



Part sectional view of the Rex sparking plug.

THE ORTO WINDSCREEN.



The Orto—an ingenious form of sidecar windscreen.

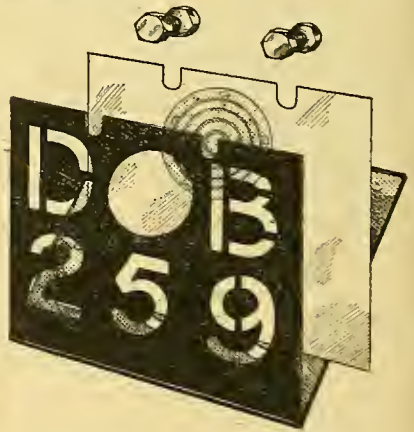
AN ingenious form of sidecar windscreen, which is patented by Messrs. Atkinson and Co., 24, Arminger Road, Shepherd's Bush, W., was lately demonstrated to us at Messrs. Robertson's Motors.

It is known as the Orto, and possesses the great advantage of being placed in a position on the sidecar in which it will most adequately protect the passenger from draught or rain. As will be seen in the lower of the two illustrations, it is pivoted at its base, and mounted telescopically, so that, when the door is opened, it causes the screen to swing back and permits the passenger comfortably to take her seat. When the door has been closed, the thumbscrews may be loosened, and the screen set to any angle desired. The screen is certainly one of the most practical we have yet seen fitted to a sidecar.

A TRANSLUCENT NUMBER PLATE.

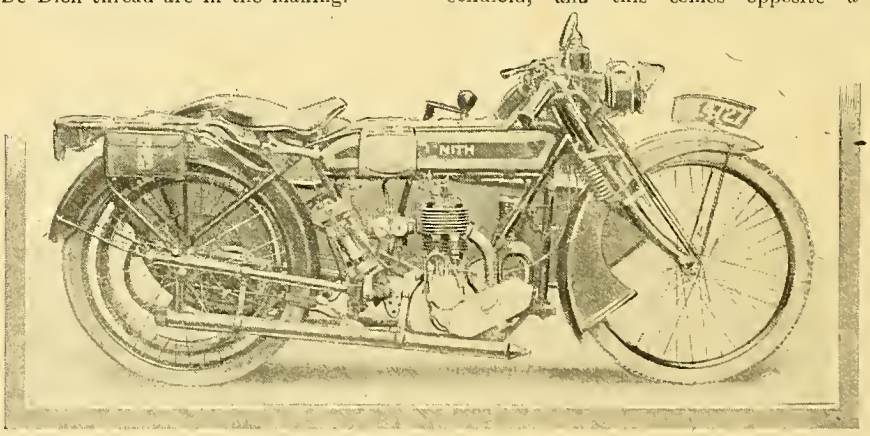
AN interesting number plate is about to be put on the market by Mr. W. O. Wood, of Lowfield Road, Stockport. The plate is made up of two metal sheets hinged together at the bottom, one of the sheets being bent over at the edges to form a bead into which the other sheet may fit when closed. Letters and numerals are cut in each sheet in such a manner as to register with each other.

Between the two metal sheets a translucent sheet of celluloid is placed; in the latter a circular hole is cut, over which is fastened a disc of red transparent celluloid, and this comes opposite a similar hole in the metal plates. The whole is closed up and held together by two small bolts and nuts, as shown in the sketch.



A novel rear number plate, in which translucency, instead of the usual reflection, is relied upon.

The object of the inventor is to provide a number plate which is made distinguishable at night by placing it in such a position that the light from the rear lamp shines through from the back, showing up the number and at the same time providing a red light. At any time the celluloid sheet may be taken out and cleaned, so doing away with the necessity of repainting.



A 3½ h.p. single-cylinder Zenith and sidecar, the driving wheel of which is fitted with the sliding mudguard described on page 209, August 26th issue. The machine belongs to Mr. R. E. Dicker, the patentee of the device referred to, who has also embodied one or two other modifications from the maker's standard practice. Among these may be mentioned the separate oil tank fitted at the bottom of the seat tube. It is fitted with a B. and H. drip feed, and the main tank is now all for petrol. Shorter back stays have been fitted in order to give a lower saddle position, different type of footrests, and heel brake.

The main improvement to the horizontally-opposed twin-cylinder Brough since the first model was introduced is the re-designed overhead valve gear and valve lifter mechanism, which latter is now enclosed in the crank case.

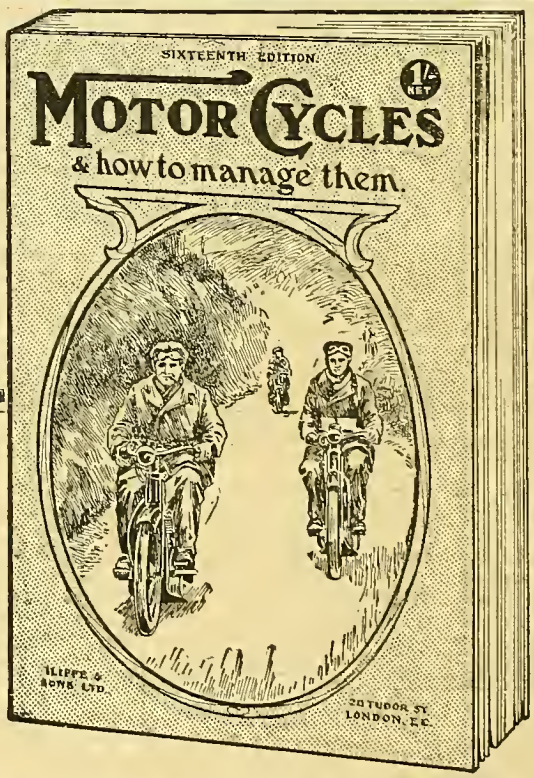
To enjoy motor cycling *thoroughly* you must understand your machine *thoroughly*



Get the **16th Edition** (Revised) *of this useful book*

"MOTOR CYCLES & HOW TO MANAGE THEM" — the standard handbook for motor cyclists — will tell you practically all you want to know about your machine.

¶ There is no doubt as to the supremacy of this book over all others of a similar kind. It is constantly being checked and revised by the staff of "The Motor Cycle," and consequently carries the weight and authority of this journal.

¶ Its contents embrace a multitude of subjects relating to motor cycles, their care and management. It is clearly written and well illustrated. Every motor cyclist—whether beginner or experienced rider—should keep a copy handy for reference.

By Post 1/3

Obtainable from ILIFFE & SONS Ltd., 20, Tudor St., London, E.C., and all booksellers and bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Two-stroke Lubrication.

I have lately bought a 2¼ two-stroke T.T. model, and am at a loss to know how much oil should always be in the crank case. It seems I have been over-lubricating to a great extent, as oil comes through the exhaust pipe. I regulate the drip feed to eighty drops a minute. Should one have the same amount of oil in the crank case as in a four-stroke, or would this affect the compression?—J.H.K.

If oil comes from the exhaust port you are certainly giving rather too much. Thirty to forty drops per minute is sufficient at ordinary speeds, but more should be given according to the conditions of running, such as travelling at high speed, against a strong head wind, or in very hilly districts. No; there should not be so much oil in the crank case as in a four-stroke. It would not affect the compression, but it would upset the mixture.

The Power of Two-strokes.

I should be glad to have your advice as to whether a 2½ h.p. two-stroke would carry a 16 stone man comfortably in a somewhat hilly town district? I do not want great speed, but reliability and fair climbing power. At present I ride a 1912 2¾ h.p. twin, but it has seen much wear, and is costing me a large sum in repairs. It carries me, but is not too strong on the hills. Probably the engine needs rebushing and the cylinders decarbonising. If I thought a lightweight costing, say, £38, would carry me reliably I would invest. My engine misfires a great deal, and occasionally I suspect only one cylinder is acting. Can you advise me? I am only a novice.—H.C.

A 2½ h.p. two-stroke, fitted with a variable gear, would carry a 16 stone man, but you would not have much reserve of power. These small two-stroke machines are good value for the money, and give wonderful power for their size. Of course, you could, for a small sum, have your machine made quite up to date, and to pull as well as ever. The misfiring might be due to air leaks in the induction pipe, faulty carburetter joints, etc. You can easily tell if one cylinder is firing by short-circuiting the plug from the terminal to the cylinder with a screwdriver. In this case, if you happen to short-circuit the good cylinder the engine would, of course, stop.

Hints to a Beginner.

(1.) My machine is a 5 h.p. twin combination. When I have an adult and two young children in the sidecar, and an adult on the carrier, in going down a bad hill, should I coast down or keep the engine working? By keeping the engine working, will it affect it in any way? (2.) My sidecar wheel is slightly buckled, but it does not affect the running. Ought I to have it put right? (3.) Does driving slowly on top gear, say 8 m.p.h., harm the motor?—E.W.V.

(1.) Coast down a hill with the machine in gear and the exhaust lifter raised. If you have a switch, also switch off. This helps to cool the engine. If you are descending a very steep hill put in the second speed, and if it is excessively steep put in first speed. This will act as a brake. (2.) The wheel could probably easily be trued up by a competent mechanic. We should advise you to have this done. (3.) It does not harm the engine to drive as slowly as 8 m.p.h. if it is running smoothly.

Valve Trouble.

Will you be good enough to inform me as to the probable causes of an engine burning out its exhaust valves very quickly? The valve seating is not cracked, but when I last ground in a valve I noticed that the angle of the valve face where it actually touched the seating was less acute than the general angle of the valve face. I use my spark retard lever rather freely when riding in traffic. Would this affect the valve by causing the gases to be hotter than usual at the moment when the exhaust valve rises, by reason of the more recent explosion? A new valve is required about every 600 miles.—B.T.

The trouble may be caused by the valves being made of incorrect material, or through driving too much on a retarded spark, and also through injudicious use of the exhaust valve lifter. We should advise you to have your valve seating recut and the valve trued and correctly fitted.

Hill-climbing.

I would like your advice on a 3½ h.p. combination fitted with a three-speed countershaft gear. Do you think it quite capable of going up any main road hill in Derbyshire or Wales, carrying about 20 stone? I went to Sheffield recently on a 3½ h.p. on middle gear, the low gear being broken, and I had to push up all hills which were in any way steep.—J.F.

We should say that the machine in question would take you practically anywhere, provided a suitable gear were fitted, with ratios not unduly high.

Tyre Wear.

I have just secured a 4 h.p. solo mount, and as it differs from my previous motor cycle I want your advice on a few points. (1.) The wheelbase being long and the hub having no three-speed gear, will the wear on front and back tyres be more equal? (2.) There is a three-speed gear box and clutch. These are luxuries, and no doubt of delicate construction. Is the top gear a direct drive, and if I confine myself to it as much as possible are the other gears absolutely at rest and likely to last a longer time? (3.) For a sidecar, do I need a stronger belt than the ⅞in. fitted, and do I need security bolts?—J.S.H.

(1.) As the back wheel has to take the driving and most of the braking strain, the back tyre will naturally wear more rapidly than the front, but this should certainly be less in the case of a long wheelbase machine without a hub gear. (2.) We regard the three-speed gear and clutch not in the light of luxuries at all, but of necessities. They are of standard design, and similar to those which have been fitted to motor cars for the last twelve years. The top gear is direct. These gears being of specially hardened material are built to wear. In changing gear you have to consider not only the gears but also the engine. If the engine is labouring on a hill it is necessary to change speed at once, and if you want to climb a hill quickly it is advisable to change early. In the gear box when the top is in engagement the other wheels revolve idly. (3.) A 1in. belt would be better if the pulleys are suitable. Security bolts are desirable.

Four-stroking.

I have a 1915 two-stroke which sometimes does not two-stroke. Both carburetter and magneto have been experimented with, without success. The machine has run 1,000 miles over Scotch roads since July, when new, and has run remarkably well. But now, unless it is accelerating or hill-climbing, it four-strokes persistently and regularly. I have tightened the magneto chain, so it is not that. The ignition appears good (C.A.V. magneto). In your opinion, does the engine want taking down? Is there a possibility of the ports being partly choked with carbon? Or the silencer choked? Or is there a possibility of one of the piston rings being stuck? The engine still pulls well, but only does about ninety miles to the gallon as against over a hundred a month ago.—P.V.S.

We should advise you to take off the cylinder and thoroughly clean your engine, paying special attention to the ports and piston rings. Four-stroking is sometimes caused by a weak mixture; therefore the carburetter should also be inspected for obstructions in the jet or petrol pipe.

READERS' REPLIES.

Repairing Punctures.—"C.T.'s" experience related in your issue of the 19th ult. was my own with a certain make of tube particularly, and I put it down to the materials employed by the makers in toughening the rubber. Petrol should not be used to clean the surface, as it is not a solvent and only makes the rubber swell. Pure benzole may be used, as this is a solvent; better not use either. Use a clean scratch brush (a file cleaner will do) to roughen the surface, and expose new rubber to the repair solution; rub the latter well in with an old toothbrush handle or clean screwdriver blade and apply when tacky and press with a pocket patch press for ten minutes.—E. Chapman.

Water in Petrol Tank.—While giving my experience, I have in mind another tip. I have seen it recommended on several occasions to detach the tank and thoroughly dry it. This is not necessary. Empty the carburetter and petrol pipe; pour in the tank half a pint of good methylated spirit and agitate. The spirit will immediately settle out below the petrol, dissolving all the water. Run it off, washing the carburetter and petrol pipe with it, connect up, and the job is done. If benzole is in the tank, run it off and then add the methylated spirit and empty and filter back the benzole through the finest gauze. Methylated spirit will not mix with petrol. It will dissolve in benzole, but, if water is added to the mixture in equal quantities, the methylated spirit leaves the benzole immediately and mixes with the water, settling out below the benzole. It should be possible, though I have not tried this, to add the methylated spirit to the wet petrol or benzole in the tank, and agitate after cleaning the carburetter and pipe with methylated spirit, and then to start up on the methylated spirit; the dry petrol would then follow on. These are facts.—E. Chapman.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"H.C." (Sheringham).—Lister two-stroke engine. Efficiency and reliability.

"S.A.G." (Notts).—Two-stroke Triumph. General experiences. How often must cylinder be removed?

"D.J.B." (South Wales).—A.B.C. model A. Reliability in wet weather, efficiency, and general experiences.

"W.J.D." (London, N.W.)—Old pattern (1911) P. and M. clutches. How to fit the new type of split bars and prevent slip.

"J.T.S." (London).—Particulars of difference in running and general efficiency between four-stroke and two-stroke lightweights.

"E.P.F." (Somerset).—Suitability of roads in Assam for motor cycling, particularly between Mangaldai and Bishnauth.

"J.S.H." (Boston Spa).—4 h.p. Douglas with three speeds and clutch, and Watsonian folding sidecar. Suitable attachment for slanting back stay.

"H.C." (Marston).—1915 A.B.C. model B. Consumption, reliability, comfort, and general experiences.

"J.R.M." (Kingstown).—Low motor cycle generator, powerful acetylene lamp to fit Indian lamp bracket, and Binks carburetter on Indian.

"G.P." (Margate).—1914 or 1915 Henderson, or 6 h.p. twin Sunbeam. Reliability, comfort, economy, and weatherproofness.

RECOMMENDED ROUTES.

Epsom to Bexhill.—W.G.

Epsom, Tadworth, Reigate, East Grinstead, Wytch Cross, Uckfield, East Hoathly, Horsebridge, Ninfield, Bexhill. The distance is approximately seventy miles.

St. Neots to Ilfracombe.—G.E.

St. Neots, Eaton Socon, Bedford, Newport Pagnell, Buckingham, Bicester, Oxford, Faringdon, Swindon, Avebury, Devizes, Trowbridge, Wells, Glastonbury, Durston, Taunton, Wiveliscombe, Bampton, South Molton, Barnstaple, Ilfracombe; or Glastonbury, Bridgwater, Williton, Dunster, Porlock—at the foot of Porlock Hill go through the toll gate so as to avoid the hill—Lynton, Coombe Martin, Ilfracombe. The latter route is bad and very hilly, but the scenery is beautiful.

Bedford to Folkestone.—W.H.

Bedford, Shefford, Hitchin, Stevenage, Ware, Hertford, Harlow, Ongar, Brentwood, Orsett, Tilbury, by ferry to Gravesend, then through Meopham, Wrotham Heath, Maidstone, Charing, Ashford, Hythe, Sandgate, Folkestone.

Leicester to Swaffham.—R.P.

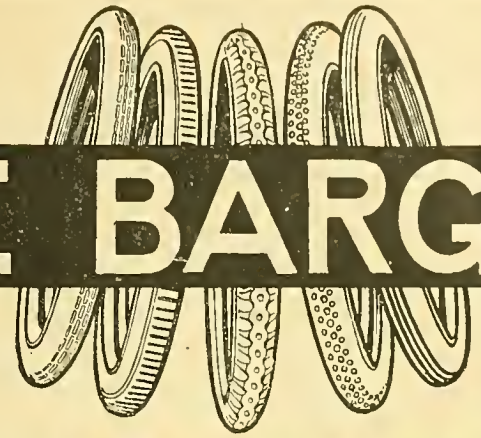
Leicester, Billesdon, Uppingham, Stamford, Market Deeping, Crowland, Thorney, Guyhirne, Wisbech, Downham Market, Stradsett, Swaffham. Approximately 92 miles.

Studham to Ashbourne.—H.W.

Studham, Dunstable, Fenny Stratford, Stony Stratford, Northampton, Husbands Bosworth, Leicester, Derby, Ashbourne.

EXTREMES MEET.

An American group. Seated on the Excelsior motor cycle is Thomas Woods, aged 21, height 6ft. 3in., weight 452 lb., whilst standing on the carrier is Albert Anderson, also aged 21, height 4ft. 1in., weight 85 lb.



TYRE BARGAINS

We guarantee all these goods to be quite new and not damaged or repaired.

All goods sent on 7 days' approval against remittance. Carriage forward unless postage is sent.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade Labour Exchange, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Effects of the New Tariff.

IT is clear that the 33⅓ import duty on cars, motor cycles, and parts will have far-reaching effects in the motor world. Such a tariff was generally expected in the new Budget—it was called for from too many quarters for the appeals to be ignored by the Government—and the resultant effect will be to increase the cost of motor vehicles all round, though more particularly those manufactured abroad. Relieved to some extent of the competition of the American manufacturer, the British maker will, it is thought, help to adjust some of the differences in the present cost of raw materials to those existing prior to the war, besides which the magnetos and other parts commonly fitted are subject to the duty. Again, the new Budget proposals are reflecting their influence on the second-hand market. Lucky is the man who was possessed of a comparatively modern motor cycle purchased some months ago. Were it not for other considerations exercising a restraining effect, such as the appreciable increase in the Income Tax, and the increase of 4d. per gallon on petrol, existing motor vehicles would have been considerably enhanced in value; but the factors enumerated will tend to check any appreciable rise. Moreover, the summer has passed and we have arrived at a period of the year when motor vehicles change hands at lowest figures, but since the British output is slowly diminishing, due to the necessity for munitions, it is a moot point whether by the springtime motor cycles will not become more valuable even than now. Thus the present outlook would indicate that motoring generally is to be more expensive, and if there is a shining star in a black outlook, it is the comfort to motor cyclists to know that they own the most economical motor vehicle extant, not only in first cost, but also in running costs. We have heard it suggested that the increase in the price of petrol will damage motor cycling, but we do not share that view. Some devotees of the motor cycle will, no doubt, be lost to us, but their numbers will be more than counterbalanced by the conversion to sidecarring of many who may have been considering the purchase of a light car.

Economy at the moment is a word to conjure with, and consequently the motor cycle as a type should receive a far less severe set back than any other.

A Probable Result of the Duty.

TURNING from what we may term the ill-effects of the tariff, we may consider some of its more favourable aspects. One can plainly see that sooner or later the main effect of the Budget will be to induce American manufacturers to purchase as much material as they possibly can obtain in this country, which will be all for the general good. We refer to such parts as chains, tanks and fittings, mudguards, rims, and tyres, in which Great Britain possesses an almost limitless productive capacity. Already more than one American manufacturer has made a practice of using certain British parts, but it is clear that in order to avoid the tariff charges a great deal more reliance will be placed upon this country sooner or later to provide many component parts, their value gradually extending as the raw material market settles down.

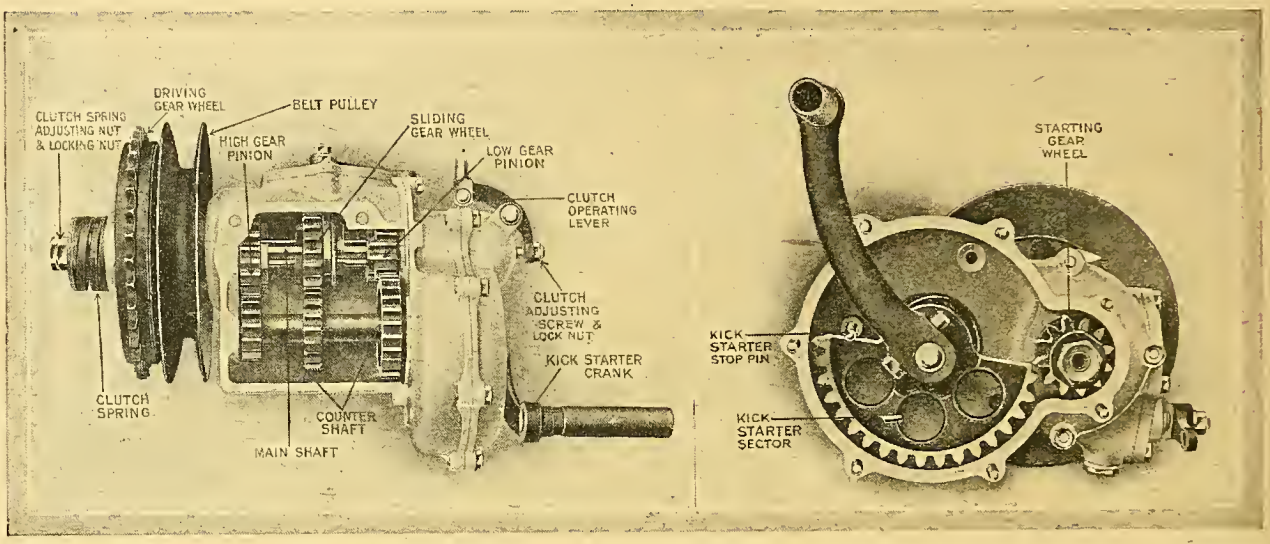
Speaking generally, the new duty has been received favourably. Even the most confirmed free trader agreed that something should be done without delay to protect the business of the British manufacturer who, by reason of concentrating all his energies on munitions, had to stand aside with his hands tied and see the astute Yankee snapping up all the business.

The taxes on motor vehicles are not affected by the Budget, so that present owners of foreign-made motors escape scot free except for the increased cost of petrol, and their vehicles, moreover, automatically become more valuable by reason of the tariff.

It may be added that the new tariff duties came into effect on Wednesday, the 29th inst.

An Index to the advertisements in this Issue will be found on the page facing the back cover.

The Ariel Countershaft Three-Speed Gear.



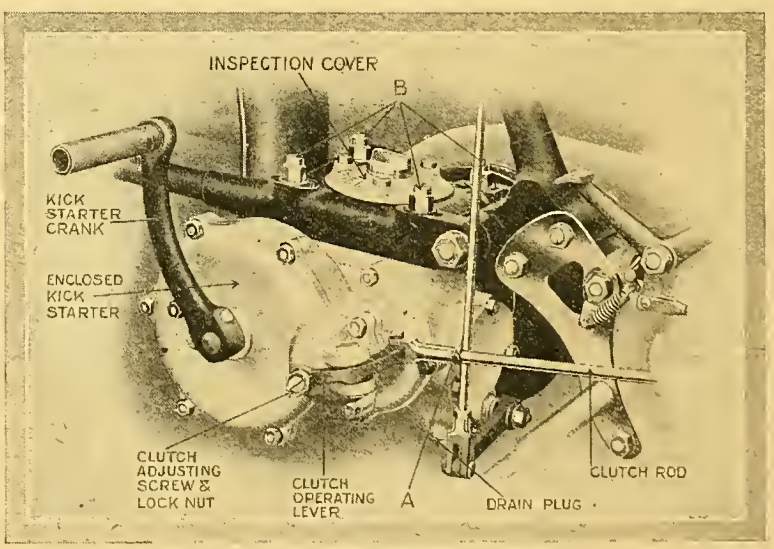
A VERY soundly constructed three-speed gear box used on more than one make of machine is the Ariel, which hails from the Ariel Works, Ltd., Birmingham. The illustrations clearly show the principle upon which it works. The high and low gear pinions are loosely mounted on the mainshaft, while the sliding gear wheel is free to slide but not to rotate upon this same shaft. The high gear pinion also carries an extension or sleeve upon which the driven pulley is mounted. The operation is as follows:

To obtain the high gear the sliding gear wheel is moved to the left, when the dogs on its face will engage similar dogs on the high gear pinion, locking the latter to the mainshaft, and bringing the direct drive into play; the layshaft will then revolve idly. The intermediate gear is in operation when the sliding gear wheel is in the position shown; the drive is now through the sliding gear to the layshaft and back to the high gear pinion and pulley. The low gear is obtained by sliding the gear wheel before mentioned to the right, and the drive is then through the low gear pinion, layshaft, and high gear pinion. There is, of course, a neutral position between each gear. The gears are in proportion of 5, 8¼, and 15⅓ to 1, but the whole series can be raised or lowered by the adoption of a different engine sprocket, those given being obtained by the use of a 15 tooth sprocket. Ubas steel forgings and the best materials only are used in the construction of the gears.

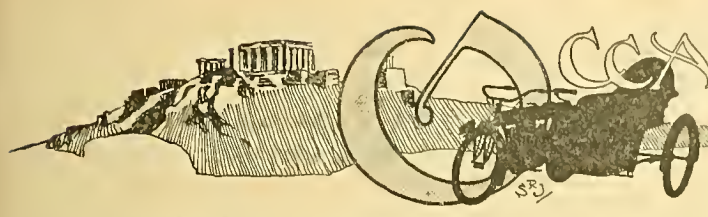
Free Engine Clutch.

The clutch is a special plate clutch with cork inserts, and is controlled by the right foot. No lubrication is necessary. In the event of wear the pressure of the spring can be increased by slightly tightening the nut shown on the left of the first picture. At the same time a slight adjustment should be made on the clutch operating lever, and a clearance of about $\frac{1}{16}$in. should be allowed. In cases where more adjustment is required than can be made by the small adjusting screw, a further means of adjustment is provided on the clutch rod when the lock nut A is loosened.

The gear box is carried below a special platform, which has elongated slots to enable the gear box to be moved backwards or forwards for chain adjustment purposes, and is held in position by four nuts B. A large cap is provided in the inspection cover for the admission of lubricant, but the box is sent out with sufficient for 1,000 miles running. It should be noticed that the first tooth of the kick starter is specially shaped to allow the cogs to mesh, no matter what the position of the smaller wheel may be.



Threequarter view of exterior of the Ariel gear box.



OCCASIONAL COMMENTS

BY 'IXION'

A Translucent Number Plate.

History repeats itself. *The Motor Cycle* for Sept. 23rd describes on page 312 a translucent number plate, incorporating a ruby rear light. In the first London-Edinburgh run (unless memory deceives me) Mr. Elyard Brown used an electric head lamp, fed by accumulators; and in the following year his firm (Vandervells) made a valise for the rear carrier, which contained, in addition to tools and kit, a couple of twenty ampère hour accumulators which supplied an electric head lamp, and also fed a smaller bulb illuminating a transparent number and a ruby disc in the tail plate of the valise. The notion was abandoned because the accumulators suffered from vibration and required charging at rather brief intervals.

Cobbles and Setts.

I quite agree that the Warrington-Preston route has been unduly maligned. Though I have not used it lately, I have traversed it dozens of times, and I never saw any reason to single out its surfaces for special denunciation. Its evil reputation rather depends, I fancy, on the fact that it is one of the few thirty-mile suburban sections which provincial riders strike when touring. Its surfaces have never been excellent, and it is always easy to miss one's routes over a section of this length where there are plenty of people about, as one misses a direction post when one is watching carts and pedestrians and cyclists with close suspicion. In reality its transit is very like such a jaunt as those on the loop routes round London, *e.g.*, Kingston to Windsor. The roads vary from fair to bad, turnings are frequent, traffic usually pretty heavy, and pedestrians numerous, especially at certain times in the day. But the provincial rider, when on tour, is unaccustomed to thirty-mile suburban strips. He strikes the Warrington to Preston strip oftener than its few rivals, and he detests it accordingly. Nevertheless, though setts are not enjoyable, they are far, far better than the virulent pot-holes occasionally encountered along the motor 'bus routes round London, a species of abomination now spreading to some Midland districts, as the motor 'bus is being applied to linking up deficiencies in the railway services.

Double Expanding Countershaft Pulley Gears.

I believe the earliest of all these gears was the Low, of which I formed the happiest impressions; and I confess it has always been a puzzle to me that the design has never been made a commercial success. I never found any reason in practice to justify the accusations of belt slip commonly urged against it. On the contrary, the contact area at low ratios was proportionately far larger than is obtained with the single variable pulley now in vogue, and the construction was simpler and probably cheaper. I have long expected some designer of high-powered sidecar or cycle car outfits to revive this transmission, with double belts and double pulleys, one on each side of the engine; and I see no reason why such a device should not be quite as satisfactory as chain transmissions. Admittedly, its best chance rests with the lower-powered outfits, as precision in gear ratios is of comparatively small account when one has heaps of engine power in reserve; but when a 3½ h.p. engine is set to drag a tremendous load, hill work is vastly improved when the correct ratio can be selected for every gradient. I hope it will be given a fresh show by some large maker.

Spring Frames and the Next Competition Season.

Supposing that the freak hill policy is maintained when competitions recommence, the users of spring frames will find that their machines enjoy enormous advantages on rough surfaces. I have tested a few spring frames lately, and I always find that tyre adhesion is vastly better when the rear half of the machine is sprung. I should put the improvement at nearly 50% in the case of a first class springing device, and everybody knows that tyre adhesion is the real crux on a freak hill, especially with three-wheelers. It counts for less on a two-wheeler, because there is always plenty of power available on solo mounts in such events, and the driver can afford to throttle down, but even the solo rider will score if his frame is sprung. He may be able to get tyre adhesion of a sort, be his frame rigid or sprung, but with a rigid frame quite half the entrants get unseated on a really bad hill, because the violent bouncings upset their steering, and they either fail to correct their swerves, or handle their controls so clumsily that the engine finally baulks—any spectator of a trial up such a mild hill as Amulree will remember that 60% of the entry usually fail from these two causes alone, both of which would be hugely modified by a good sprung frame. So I warn the trade that certain firms are busily going ahead with sprung frames, and that these firms will reap a colossal advertisement from the Six Days Trials when peace returns.

A Cycle Car Testimony.

One of our staff bears similar testimony from the cycle car standpoint. Not long ago he purchased a cycle car, the springing of which was unsatisfactory. After a time he added a pair of shock absorbers to the rear axle, and the improvement in the riding was the least of his pleasures. He found he could now climb many slopes on top gear which had formerly necessitated a change down. This was due, in part, to the fact that the increased comfort induced him to rush them at higher speeds. But it was further partly ascribable to the fact that his rear tyres now secured a constant and even grip, whereas before the absorbers were fitted his engine must have felt as if he were alternately accelerating, declutching, and braking, seeing that his tyres had never been in road contact for more than half a minute at a time. For this reason better tyre wear has also resulted.

The Mechanical Testing of Metals

AND THEIR INTERNAL STRUCTURE.

CONCLUDING INSTALMENT. By ARTHUR MARKS, F.I.C., A.R.C.S., A.R.S.M.

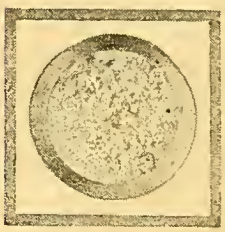
THE tests which we are now about to consider have been devised as a consequence of the fracture of normally strong steels when subjected to insignificant stresses. The fact that metals would fail when subjected to stresses below their elastic limit was known before 1849, when the question of the use of iron in railway construction was considered by a Royal Commission. Certain other tests will be dealt with as they group themselves with the question of structure. The series of dynamic bending tests are conveniently known under the general name of impact tests. Most motor works now insist upon various parts of the motor being subjected to one or other of these tests.

Shock Fracture.

It is often desirable to find the energy which is required to bring about fracture by the application of a single blow. The metal is fixed at one end whilst a pendulum weight is allowed to strike the piece in the course of its fall from a fixed height. A test of this nature is frequently applied to railway couplings, which are subjected to shock fracture when a heavily loaded train is started suddenly. The falling weight consists of a pendulum of about 30 cwts. which strikes an anvil consisting of a second pendulum of about 4 tons weight, to which one end of the coupling is bolted. The other end of the coupling is attached to a firm foundation. Thus, when the small pendulum is allowed to fall from a measured height, the energy of the blow can be calculated in foot-tons, and after the coupling has broken, the height to which the anvil is swung can be used to calculate the energy above that used to break the coupling. Thus a convenient comparison can be made between the slowly applied breaking load given by the tensile testing machine and the shock load which the impact machine exerts. The microscope shows that an entirely different fracture occurs in the two cases—the former we have discussed. In the case of a suddenly applied load, the fracture occurs at the cleavage planes of the crystals. These are planes closely related to the crystalline structure, and are planes along which there is a tendency for the crystal to split. This splitting along certain planes is often noticed when a blow is applied to a piece of coal or the common mineral calc-spar.

Repeated impact fracture.

0·6 per cent. carbon steel, 1in. blow. Broken after 6,600 blows.



Repeated impact fracture.

0·6 per cent. carbon-steel, 1½in. blow. Broken after 1,800 blows.

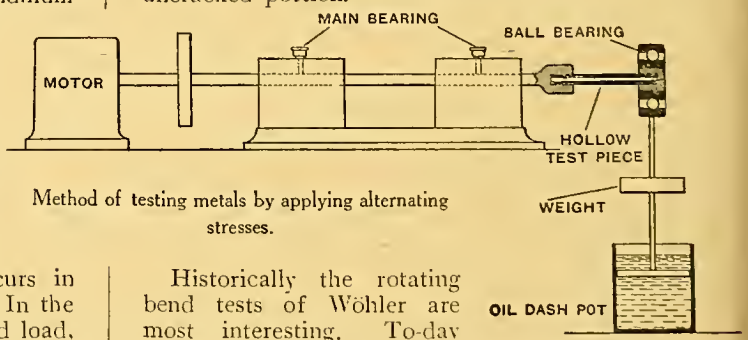
Repeated shock fracture tests are also applied to metals. Small blows of the order of four-inch-pounds are applied to the test piece of metal, supported at its two ends, and with a groove cut round it at the position where the hammer strikes. The specimen is turned over after each blow. Various devices on the principle of either the tilt hammer or drop hammer are used for the purpose of delivering a large number of small blows. For example, a machine might deliver at will fifty ½in. blows per minute, or 150 1in. blows per minute, or intermediate values. Comparisons of the resistance of various steels to these repeated impact tests, using the same size pieces for the tests, gave the following figures:

NUMBER OF BLOWS BEFORE FRACTURE (85 per Minute, ½in. Drop).

% C.	Carbon Steel.	% Ni.	Nickel Steel.	% Ni.	Nickel Chromium.	% Cr.
0.04	12,500	0.3	14,000	4.8	123,000	1.25
0.3	44,000	2.0	19,000	3.2	96,000	1.70
0.5	44,000	25.0	64,000	4.5	156,000	1.45

The advantage of using a 25% nickel steel for a valve which receives a large number of small blows whilst working is evident from the table, and the remarkable resistance of a nickel chromium steel is also shown. Each of these steels consists of Austenite, whereas the carbon steel shows ferrite and pearlite under the microscope. By hardening the higher carbon steels and annealing them, thereby producing a sorbitic structure, the resistance to repeated impact is raised.

The fracture takes place by gradual cracking of the metal. Small fissures start in the metal which gradually grow until the specimen breaks quickly across the uncracked portion.



Method of testing metals by applying alternating stresses.

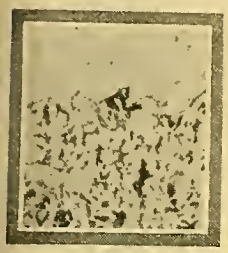
Historically the rotating bend tests of Wöhler are most interesting. To-day the Wöhler test is carried out in the machine sketched. The hollow test piece is rotated rapidly by the motor, whilst the free end is held down under a definite weight. The number of rotations required to break the test piece is counted, and by treating the various metals under the same conditions the relationship of their resistance to a bending stress can be obtained. Thus in the case of a carbon steel the quenched metal after annealing withstood 43,000,000 revolutions, whereas the softened metal only withstood 27,000,000 revolutions under the same load.

Alternating bend tests have been used on short lengths of metal in which the test piece of about 3in. length is gripped at one end and the other end bent

The Mechanical Testing of Metals.—

to and fro, either by means of a long lever by hand or by a piston actuated by means of an electric motor. Vibration tests in which a long rod of metal fixed at one end and vibrated at the other end by means of an electro-magnet have also been devised and are regularly employed.

The alternating bend tests are easily and rapidly carried out, and are, therefore, frequently used. Vibration tests are very important, since the reflected vibrations may encounter the next emanating vibration, with the result that considerable stresses are produced. Similarly, stresses greater than the metal will stand are frequently produced by the arresting of vibrations at some point in the metal causing cracks which ultimately result in fracture. Cases are known in which the excessive vibration in steering rods, due to rough roads, have resulted in fracture owing to this cause. Strengthening by increasing the cross section of the metal was at one time vainly practised on large connecting rods with the object of reducing the possibility of fracture. It was very soon found that this method of overcoming vibration effects was an aggravation of the evil, and the design of these motor parts now takes vibration effects into consideration.



Single blow fracture.
Micro - photograph showing fracture across ferrite and pearlite.

Photographs of fractures produced by various methods are shown in the accompanying figures. The process of fracture in all these cases is due to the development of small flaws in the metal. These are at first only microscopic, and, as the reader will have gathered, are most readily developed in the metallographic constituent ferrite, which is common to the softer steels. The formation of these flaws takes place by the gradual development of slip-bands in the crystal of the metal. A complete proof of this was given by Ewing and Humphrey, who obtained a series of photographs at 1,000 magnification of the same crystal of metal after it had been subjected to 1,000, 2,000, 10,000, and 40,000 reversals of a stress of 12.4 tons per square inch. The gradual increase in the microscopic bands parallel to one another was clearly shown in the successive photographs.

Tensile fracture.
Micro - photograph showing elongated crystals, and fracture across pearlite and ferrite.

In conclusion, we may note that (1) whatever type of repeated stress a metal is subjected to, *even though the stress is below the elastic limit*, the metal may break if the stress is repeated a sufficient number of times; and (2) the fracture of the metal occurs by the development of cracks through the crystals of the metal, and not by the *so-called crystallisation of the metal under the repeated stress*.

An Indian Two-stroke Lightweight.

HITHERTO America has not favoured the two-stroke lightweight, or, at any rate, no specimen has found its way to this country, but it was evident, with the knowledge and experience which American manufacturers have had in two-stroke engines applied particularly to marine work, that an American two-stroke motor cycle on up-to-date lines would not be long in signalling its arrival. Consequently, we were not really surprised when Mr. W. H. Wells, in outlining his 1916 programme to us last week, mentioned that an entirely new Indian two-stroke lightweight would shortly make its appearance. The Hendee Co. have during the past year bought and tested samples of the leading British lightweights, and have designed one which will be no less attractive in its class than the twin-cylinder machines which have made the Indian name famous. The new lightweight is a two-stroke engine of the three-port type, and is rated at 2½ h.p. It has a three-speed gear box and kick starter—a miniature replica of those fitted to the heavier models, which, by the way, are to be modified in design in 1916, having two sliding pinions instead of the one formerly used—and an enclosed chain drive.

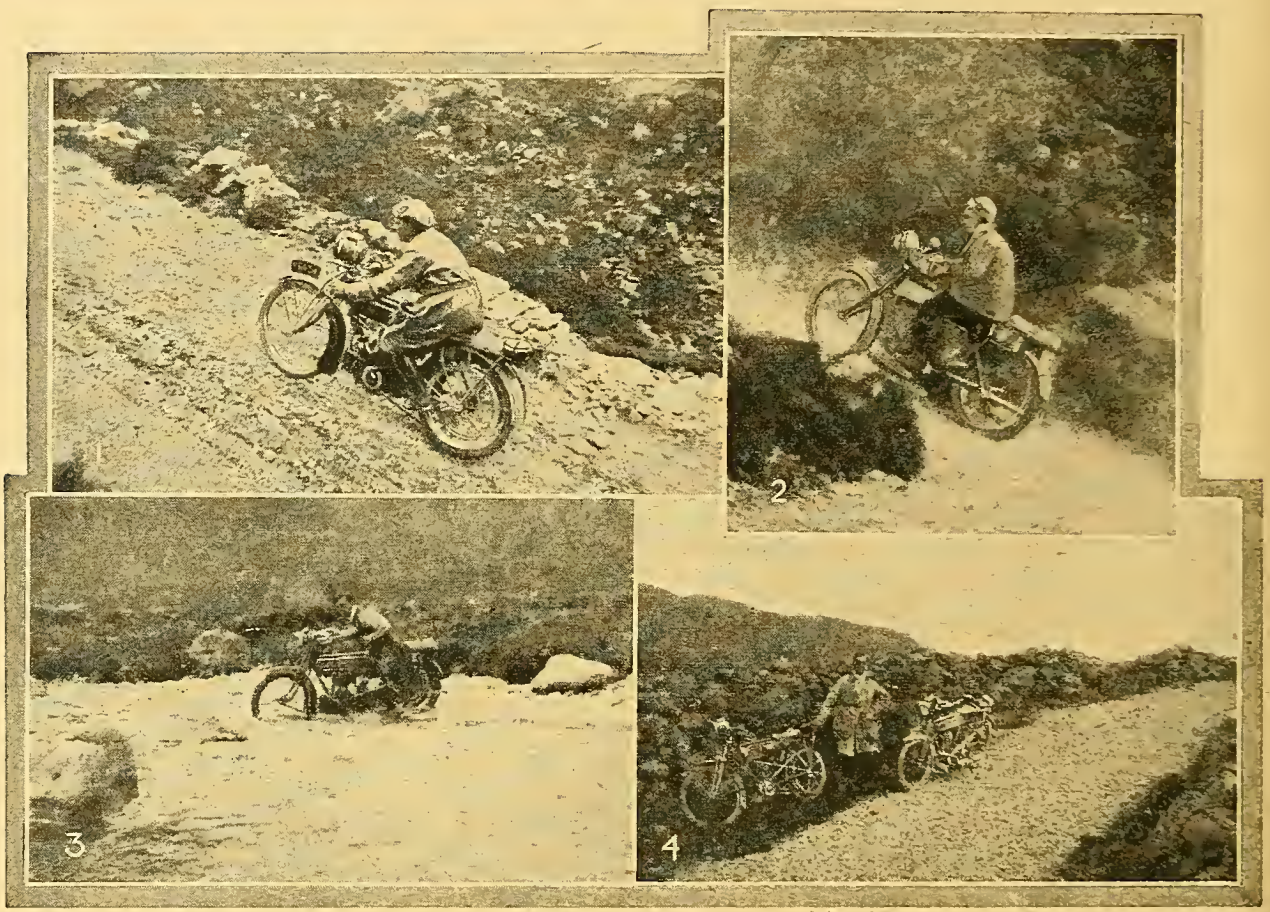
The control is by Bowden wire mechanism. The spring front fork is of exactly the same type as fitted to the earliest Indians imported in this country. In fact, the whole machine bears a strong resemblance to the original 1¾ h.p. Indian motor cycle of about 1907, except that the engine in the latest model is fitted vertically in the loop frame, in accordance with accepted practice. We have seen photographs of the forerunner of the type, but further amendments to conform to English ideas will be made before it will be exposed to the public gaze. It is a neat and workmanlike mount, and a feature of this new Indian, we were told, is its silence. The Hendee Co. have particularly mentioned that most of the examples they have tried are noisy, but the design they have adopted is noticeably quiet in running, thanks to its large capacity silencer and extension pipe.

MORE NORTON RECORDS.

D. R. O'Donovan has been record breaking again, and very successfully too. His mount was, of course, a Norton, and on this occasion (on September 22nd) he went for the Brooklands sidecar records, and succeeded in lowering both the existing times for classes G (500 c.c. limit), H (750 c.c. limit), and I (1,000 c.c. limit). The single-cylinder Norton has a bore and stroke of 79 × 100 mm. = 490 c.c., and O'Donovan's time for the five miles was 5m. 6⅕s., equalling a speed of 58.78 m.p.h. The records lowered are that made by J. Cocker with a 499 c.c. Triumph at a speed of 58.06 m.p.h., by E. B. Ware on a 744 c.c. Zenith at a speed of 58.10 m.p.h., and by A. V. Sumner on a 964 c.c. Zenith at a speed of 53.25 m.p.h.

The equipment of O'Donovan's Norton included Dunlop tyres, Lycett saddle, and C.A.V. magneto; Pratt's spirit and Speedwell oil were used.

Hill-climbing in Lakeland.



SCENES DURING THE HILL-CLIMBING EXPEDITION REFERRED TO BY MR. J. COHEN.

(1.) A 3½ h.p. Bradbury being ridden up Honister Pass, from the Buttermere side, by A. G. Robinson.
(2.) J. Cohen, riding a 4 h.p. Norton, on Stoneythwaite Rake.
(3.) Crossing the river Duddon, after surmounting Wrynose Pass, on a 4 h.p. Norton, with Sturmey-Archer countershaft gear.
(4.) At the summit of Wrynose Pass. 3½ h.p. Bradbury (left) and 4 h.p. Norton machines, which made the climb.

AFTER reading the interesting article describing the conquest of the Wrynose Pass from the eastward side by a lady driver of a 6 h.p. Enfield and sidecar, and the challenge with which the article concludes, I venture the opinion that the route is hardly practicable for competition purposes. There are numerous places where it would be highly dangerous, if not impossible, for one sidecar to attempt to pass another owing to the narrowness of the track. As often as not the latter passes either between two banks or between a boulder-strewn bank and a precipice protected by a mere apology for a wall.

On July 3rd of last year, when out testing the Sturmey-Archer countershaft gear, I succeeded in surmounting the Wrynose Pass mounted on a 3½ h.p. Rover with sidecar and passenger (seated in sidecar), the lowest gear being 12½ to 1. One stoppage only was required, and this was to remove one or two large boulders, which prevented progress on a part which has since been repaired (?). No attempt was made to lighten the machine, and full luggage for two was carried.

On June 29th of this year a friend (Mr. G. Robinson) and myself, mounted respectively on a 3½ h.p. Bradbury and a 4 h.p. Norton, both solo, easily negotiated the climb non-stop. We descended the far side to Duddon Bridge on to Ulpha, leaving the road to make a successful attack on Stoneythwaite Rake, which, in my humble opinion, is the worst hill for sheer continued gradient that I have yet encountered. Our gears were as follow:- Bradbury, 4½ top, 6½ middle, 9¼ bottom; Norton, 4½ top, 7⅓ middle, 12 bottom. The bottom gear on the Norton was never used on the Wrynose Pass, and only used up Stoneythwaite to permit the driving wheel to grip.

Mr. Abraham's remarks on road repairs are quite justified. The repairs on the Wrynose apparently consisted of some soft red mud and grass, with a few stones here and there to facilitate skidding.

J. COHEN.

A LAKE DISTRICT WARNING.

The ten-mile speed limit order in operation at Staveley is likely to be strictly enforced by the local police authorities at any time. The Automobile Association learns that traps are being worked in the villages of Windermere, Bowness, and Ambleside.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Leaky Crank Case.

My engine is in pieces, because the crank case leaks badly. How can I best pack it up to prevent such leakage?—M.G.T.

As you do not say whereabouts in the crank case the leakage is, we can only tell you that if it occurs at the joint, fit a washer consisting of brown paper soaked in boiled linseed oil.

A Carburetter Blow-back.

I have a 2½ h.p. twin-cylinder machine which consumes (or wastes) an abnormal quantity of petrol, its average consumption being about 30 m.p.g. I have discovered that a puff of gas is blown out of the carburetter air intake at each stroke of the piston, and when the air intake is fully open this puff is so heavily laden with petrol that the moisture is visible on the bare hand. I do not think this happens at the exhaust stroke, as the puff is not hot. If this accounts for the waste, can you help me to remedy it. The carburetter is radically wrongly set.—W.J.C.

The blow-back through the air intake is probably due to weak inlet valve springs or wrong timing. Possibly you are using too large a jet. You should also see that your inlet valves have not too much opening. See "Motor Cycles and How to Manage Them."

Taxes.

I am interested in your answer to "T.R." in a recent issue. (1.) Is there any reduction in the £1 tax for registration in the last three months of the year? (2.) Is there anything further to be done to satisfy the law, whether in ordinary times or during the present war conditions? (3.) Should these things be done before taking delivery of a motor cycle?—W.R.D.

(1.) Yes, if the local taxation licence is taken out on or after October 1st half fees are charged. This, however, does not apply if the machine is purchased before that date. (2.) You have, of course, to take out a driving licence, and register the machine. (3.) The driving licence must certainly be procured before you take the machine out. As soon as these numbers are applied for, the County Council begin to make enquiries as to whether or not you have obtained a local taxation licence.

Breaking Spokes.

I am the possessor of a 4½ h.p. 1915 all-chain combination, and have had practically no trouble except from broken back wheel spokes; in all I have broken eight at different times. Each one of my motor cycling friends has a different reason for the breakages, *e.g.*, pot-holey roads, tension of spokes originally too great, strain at corners, "chugging" when going very slowly on high gear, etc. Can you suggest the correct reason? The spokes always break off at the hub on the chain side of the back wheel.—SCOTTY.

The suggestions of your friends are quite sound; every reason given may be the correct one. The spokes break because the stress upon them is greater than they are capable of standing, they may have been too large in the first place, or the spoke tension may have been uneven, thus throwing more strain on one spoke than another. We should advise a stouter gauge.

Petrol Consumption.

There are one or two points about my 2½ h.p. I should be much obliged if you would explain: (1.) The makers say 120 m.p.g. is a fair average. This machine, when I bought it new three months ago, had a 31 jet, and I got about 80 m.p.g. I changed it for a 28 jet, and am getting about 85 m.p.g. I should be quite satisfied if I got about 110. (2.) How often should the carbon deposit be removed from the cylinder? I have run it about 1,400 miles, and the engine soon begins to knock.—C.X.

(1.) Very few 2½ h.p. machines give the low consumption claimed. Not that these consumptions are impossible, but the fact remains that the ordinary driver does not worry very much, but drives according to his own inclination. If anyone tries to get an unusually low consumption, it is comparatively easy to do so at the risk of slight discomfort. For instance, you have to keep the speed down to about twenty miles an hour, advance the spark fully, drive on the throttle, and coast down every conceivable hill, giving so much air that the engine misfires when you attempt to slow down. Still, you should easily get 100 miles to the gallon with this machine, and you might try using a still smaller jet. (2.) You might decarbonise the engine every 1,500 or 2,000 miles.

What to do in a Thunderstorm.

(1.) Is it safe to ride on in a thunderstorm? I was caught in one a short time ago, when the lightning was very bad, but was informed that the tyres, being non-conductors, made it safer for me to be on the machine than when sheltering. Have you known any motor cyclist killed by lightning? (2.) What do you consider a reasonable mileage for a back tyre on a 3½ h.p. solo machine? (3.) Is a speedometer likely to be out of order when it makes a distinct squeak when I am pushing or going slowly, as if a needle were rubbing on the glass?—J.J.B.

(1.) As the tyres are non-conductors, we should say it would be much more dangerous to be on the machine than off it. The fact that the machine would be insulated from the ground, if the roads were dry, would render you far more liable to damage than if it were a conductor, and the current on its way to earth were not obstructed. On wet roads, on the other hand, the machine being a good conductor, there would be less chance of damage. It is very rare, however, that lightning strikes a moving object, and we have no record of any motor cyclist being struck while on his machine, or even near it. If you are out in a thunderstorm, and do not care to ride through it, it is best to leave the machine and stand well away from trees. (2.) About 3,000 miles. (3.) The squeak is probably due to some part of the speedometer being dry. Detach the cable and squirt some oil in. This will probably run down. A drop or two of oil each end would be advisable.

"The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half-plate, 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited 20, Tudor Street, London, E.C.

Hints on Changing Gear.

(1.) My machine is a 1912 Triumph, fitted with an N.S.U. speed gear. Is it advisable to lift exhaust when changing gear? I always do so, but have been told not to. (2.) The machine, after running a short distance, takes full air, with throttle very little open, say for a speed of 20 m.p.h. This looks like too large a jet—I have never seen it, so cannot say the size—but I am getting 100 miles to the gallon. The machine runs very well, but would it run slower on top gear with smaller jet, and do you advise fitting one? The slowest speed now is 9 or 10 m.p.h. (3.) Why is the smoke from my long fish-tail exhaust black, but it is hardly noticeable unless one looks closely, whilst smoke from most machines is grey and very noticeable? I have used two or three different makes of oil, but the smoke is always this dark, almost invisible, colour.—H.C.A.

(1.) It is advisable to lift the exhaust when changing gear. The gear is one which is rather slow to change, and consequently while changing from low to high, or *vice versâ*, the engine would be racing if its speed were not checked by some means. (2.) If you are getting 100 miles to the gallon, do not worry about the size of the jet. It appears to be perfectly satisfactory; the slow running is also good. (3.) Black smoke, on the other hand, certainly does point to too strong a mixture, caused by too large a jet, but if the valves are standing up well, and the machine is otherwise satisfactory, we think you might almost leave things as they are.

Two-stroke v. Four-stroke.

Is a two-stroke engine of 349 c.c. more powerful than a four-stroke twin of the same c.c.? My 2¾ h.p. Douglas is rather slow to start on low gear, also slow to pick up on a hill, especially if there is a hill after taking a corner, for which I have had to throttle down. The engine has done about 1,500 miles since last taken down. The plugs are often sooty although I do not appear to be giving too much oil, as the needle gauge is only turned about four marks, or less than half-way. My carburetter is an Amac, with No. 26 jet. The air I keep full open unless, of course, when starting, but I can drive for miles without touching the air lever.—L.W.

The two-stroke engine gives more power, especially at slow speeds, than a four-stroke engine of the same cylinder capacity. The engine in question is particularly good at accelerating, especially on the low gear up hill. The engine should be decarbonised, the valves ground in, and, if necessary, new valve springs should be fitted. If you look to these points we think that you will find the machine will be greatly improved in running. Also, it is possible that you may be using rather too high a gear. It would be advisable to fit an adjustable pulley. See that the tappet clearances, when the engine is warm, are about equal to the thickness of the paper on which this journal is printed. The carburetter seems to be properly adjusted.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"G.H.S." (Dartford).—Whittle belt for use with 3½ h.p. Triumph

"E.B." (Yorks.).—Stelastic tyre on back wheel of a 6 h.p. twin with sidecar. Mileage and freedom from puncture.

"T.R.F." (London). — Four-cylinder Henderson. Comfort, reliability, and consumption.

"P.K.S." (Brooklands). — Velocette two-stroke. Reliability, economy, silence, hill-climbing, and slow running.

"S.J.W." (Portsmouth).—General efficiency and belt wear with Grado pulley on 6-7 h.p. twin.

RECOMMENDED ROUTES.

WALSALL TO CHEDDAR.—H.E.R.

Walsall, Wednesbury, Tutbury, Brierley Hill, Stourbridge, Kidderminster, Worcester, Tewkesbury, Gloucester, Bristol, Axbridge, Cheddar.

TENBURY TO LONDON.—D.W.

Tenbury, Witley, Droitwich, Alcester, Stratford-on-Avon, Banbury, Aynho, Bicester, Aylesbury, Tring, Berkhampsted, Watford, Edgware, London. Approximately 140 miles.

STRANRAER TO TIPPERARY.—M.J.K.

The distance from Stranraer to Larne by sea is twenty miles. Your best route from Larne to Tipperary would be: Larne, Carrickfergus, Belfast, Lisburn, Dromore, Banbridge, Newry, Dundalk, Ardee, Kells, Clonmellon, Mullingar, Ballymore, Athlone, Ferbane, Cloghan, Birr, Roscrea, Templemore, Thurles, Cashel, Tipperary. The distance is approximately 252 miles.

SHEFFIELD TO BLACKPOOL.—J.W.M.

Sheffield, Midhopestones, Penistone, Huddersfield, Elland, Hebden Bridge, Todmorden, Burnley, Accrington, Blackburn, Preston, Kirkham, Blackpool Approximately 92½ miles.

HALSTEAD TO NORTHAMPTON.—R.C.

Halstead, Haverhill, Cambridge, Caxton, Eltisley, St. Neots, Kimbolton, Higham Ferrers, Northampton. Approximately 83 miles.

CHOBHAM TO CLACTON-ON-SEA.—E.H.

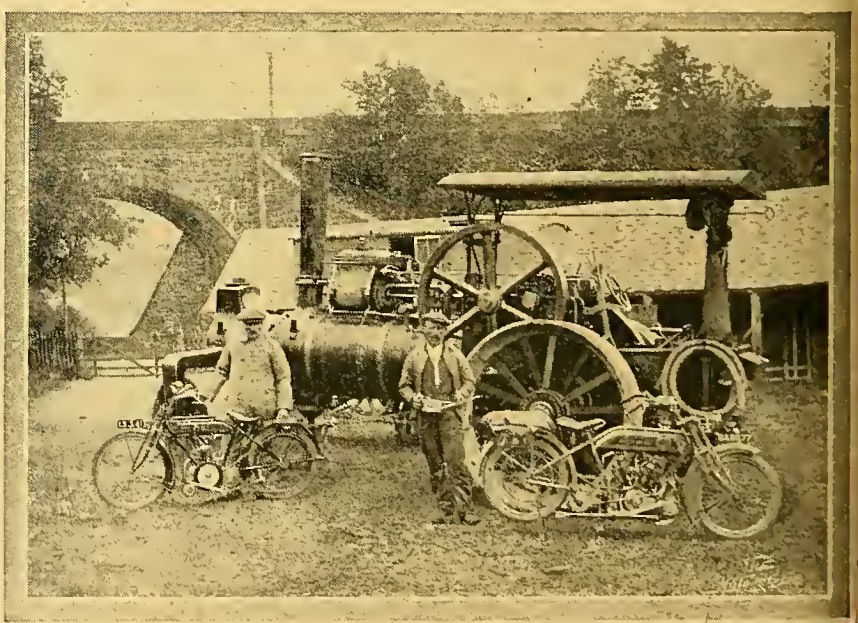
Chobham, Windsor, Slough, Uxbridge, Rickmansworth, Watford, St. Albans, Hatfield, Hertford, Bishop's Stortford, Dunmow, Braintree, Coggeshall, Colchester, Thorrington, Clacton-on-Sea. Approximately 116 miles.

YORK TO TAUNTON.—F.W.W.

York, Tadcaster, Aberford, Brotherton, Wentbridge, Doncaster, Worksop, Mansfield, Nottingham, Loughborough, Leicester, Wolvey, Coventry, Warwick, Wellesbourne, Halford, Moreton-in-the-Marsh, Stow-on-the-Wold, Cirencester, Malmesbury, Chippenham, Bath, Radstock, Wells, Glastonbury, Durston Taunton.

BLACKPOOL TO RAMSGATE.—T.C.

Blackpool, Kirkham, Preston, Wigan, Warrington, Tarporley, Whitchurch. Wellington, Bridgnorth, Kidderminster, Worcester, Cheltenham, Cirencester, Fairford, Faringdon, Wantage, Streatley, Reading, Riseley, Hook, Odiham, Farnham, Guildford, Shere, Dorking, Reigate. Redhill, Westerham, Leatherhead, Wrotham Heath, Maidstone, Lenham, Charing, Canterbury, Sturry, Ramsgate. Approximately 245 miles.



DRIVING CONTRASTS.

A twenty-one year old road roller, with its driver, on the left, and his 2½ h.p. Sun, which he rides during his leisure hours. Both the driver and his assistant (standing by the side of the Abingdon King Dick) have accompanied the engine since it was new. The latter is still going strong, but the driver prefers the two-stroke as a runabout!

TRAINING CYCLISTS FOR THE M.M.G.S.

How a Six Days' Course is Sufficient to Produce a Good Sidecar Driver. The Simplicity of the Motor Cycle Exemplified.

Ascending a grassy rise. Stopping and starting on this climb form one of the final tests.

WHEN recruiting for the Motor Machine Gun Service was in full swing, it was often found that a cyclist of good physique but lacking knowledge of the driving of a motor cycle could not be accepted. Being aware of this fact, Mr. W. H. Carson, on behalf of his firm, Bayliss, Thomas, and Co., makers of the Excelsior, offered his services in the training of novice recruits, which patriotic offer was communicated to Lieut.-Col. Bradley, Commanding Officer of the M.M.G.S., who readily assented to the proposal outlined by the Editor.

Since that time many raw recruits have found a way into the M.M.G.S. as motor cyclists, and are, moreover, possessed of some mechanical and theoretical knowledge in addition to driving experience.

Messrs. Bayliss, Thomas, and Co. entered into the scheme in a practical manner, placing qualified instructors, including Mr. W. H. Carson (the manager) and Mr. E. Milton, in charge of the work. They have provided a room at the works for lecture purposes, and other facilities to enable the recruits, not only to handle and drive the machines in an efficient and capable manner, but to understand thoroughly the mechanism and working.

It is interesting to follow the recruits from the time they commence their tuition until the inspection by the examining officer. After being accepted, the men are medically examined and attested at the local recruiting office, and from that day they at once receive pay and billeting allowance, and are, of course, subject to military orders and discipline. As such they are turned over to the Excelsior school, and, if their progress at the end of a week's training is satisfactory, they are certified efficient by the inspecting officer and sent to the M.M.G.S. training centre.

Theory and Practice.

Arriving at the school in batches of six, the majority of the men have never handled or driven a motor cycle before, and it is assumed they know absolutely nothing of the subject. The first day they attend lectures in a room well stocked with such books as "Motor Cycles and How to Manage Them," "Tracing Troubles," which they can take home and study in their spare time. On the walls are large sectional drawings of engines, gears, carburetters, and magnetos. Still more useful, perhaps, are the sectional working models, and the large number of parts dismantled which can be assembled to illustrate the particular topic under discussion. In addition to the parts of an Excelsior engine is a splendid sectional working model of a 3½ h.p. Triumph engine kindly loaned by the Triumph Co. The men are not rushed through the course, but the function and action of each and every particular part are described and explained. They are made to feel that their success as motor machine gunners and drivers depends on their individual attention to make the most of the opportunities offered. Questions and enquiries, however foolish they may seem, are encouraged. Very often a foolish question results in greater knowledge being imparted than if it had not been asked. It is found that a morning and afternoon lecture of two to two and a half hours each supply the necessary preliminary insight into the mysteries of a motor. The men are then conducted to the works, and an engine started on the bench to afford a demonstration of the explanatory work of the day.

Training Cyclists for the M.M.G.S.—

In the evening they attend another lecture, this time by Mr. Geoffrey Smith, editor of *The Motor Cycle*, whose subject is usually on possible sources of trouble and stoppages likely to be met with on the road, and the easiest method of tracing the cause.

On the second day the road test begins, and driving lessons are given in real earnest. They are taken to a common, where there is no danger to other road users, and not until the men are thoroughly proficient in handling and controlling a 5-6 h.p. motor cycle and sidecar are they allowed any road or traffic riding.

Teaching Recruits to Drive.

Excelsiors are used, chiefly 5-6 h.p. singles with three-speed countershaft and chain drive. After the men have thoroughly mastered these, they are allowed on a 5-6 h.p. Clyno and sidecar, which is the private property of one of the instructors. The first thing to be taught is how to start up the engine, and this is not always as easy as one would imagine. It must be remembered the men are raw novices, not motor cyclists. On one occasion, in a batch of six men, not one could start the engine during a period of 1½ hours, though every time the instructor demonstrated he did it first kick. It is just a matter of knack, but within two days each and all of these same men could accomplish it first time.

The actual machine first used is what is generally known in the works as the "'Bus." It consists of a 5-6 h.p. Excelsior, to which is attached a rather wide and extra strong chassis, on which a large box is mounted. Into this box five of the men are crammed, with an additional one on the carrier, with Mr. Milton, the instructor, driving. The chief reason the "'bus" is used is the fact that it is difficult to overturn owing to its weight and width; this naturally gives the men more confidence.

With the instructor in the box, the novice is shown how to engage the first speed. He is kept on the first speed entirely, to get the hang of the steering, being made constantly to stop and start the machine, using brakes, etc., on both up and down gradients. Then when confidence and proficiency are attained, the second speed is brought into use, and lastly the third or top. As the men get more used to the machines they have to run into ditches and are expected to drive out without assistance. They then perform circles and figure eights in the smallest of space, with and without passengers. Also to steer tortuous courses between obstructions which only allow for a margin of 6in. each side of the machine. This with and without passengers.

TRAINING CYCLISTS FOR THE ARMY MOTOR CYCLIST SECTIONS.

Performing circles and the figure "8" in and out of goal posts, and ascending short stiff rises, form part of the daily training.

The Country's Call.

No arm in the service has figured more prominently or with greater distinction than the Motor Cycle Dispatch Rider in this world struggle of the nations, and no motor has shown greater adaptability from peace to war conditions, and proved its great superiority under the unparalleled conditions prevailing, than the Trusty Triumph.

TAKE IT AND TEST IT!

You can have this superb speedometer on trial for thirty days. All Stewart Speedometers may be had that way. The customer pays for the instrument, is allowed 30 days to determine whether it is as good as it is stated to be, and then, if not satisfied, he simply returns the speedometer and has the price refunded.

Model R (illustrated) registers from Zero to 75 miles, season mileage to 10,000 and repeating, and 100 mile trip register. Heavily nickelled finish, and nickel flexible shaft complete the most wonderful value in Motor Cycle Speedometers ever offered.

MOTOR CYCLE SPEEDOMETER

50/-

Training Cyclists for the M.M.G.S.—

Then comes a surprise. One day they find a much nicer looking sidecar attached to the machine, which is an extremely light wicker model on a much narrower chassis. All are anxious to try the new mount, and they are at once set to cut the customary figure eights and circles. But almost before they have started the machine they find the sidecar over their head, much to their surprise and the amusement of their companions.

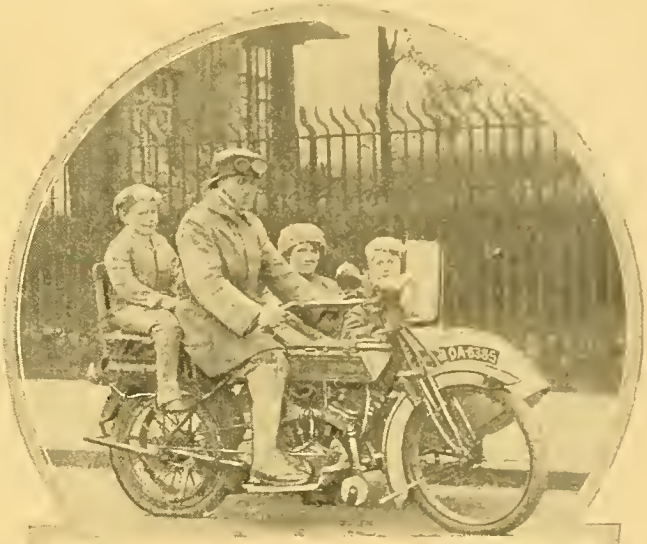
It must not be thought that this is done for amusement. It is really serious business, and the object is to make each man control the speed of the machine in such a manner as to be able to turn in the smallest space without bringing the sidecar wheel off the ground. This the light sidecar makes them do, no passenger being carried. Immediately the speed is too high up comes the sidecar. One day spent in this manner makes the men most careful, and before the day is over they can turn in either direction in about the length of the machine. In fact, many can do the left-hand turn, the sidecar wheel remaining stationary.

They are now considered ready for the road, and it is usually started by one or other driving out to the common. The instructor then takes two at a time on the road, the former being in such a position as to be able to control the machine if necessary. The machines naturally do not come off without a scratch; it is a common thing to have the footrests smashed and carried right away, mudguards crumpled up, and other minor injuries. On the common, also, minor accidents occur. On one occasion the driver could not pull up and went half through a hedge, with the result that his face and hands suffered.

The results are more than satisfactory. On the last day (six days only being given to each batch) the men are inspected and put through their trials, and in no case has one failed to pass the tests imposed. We have been moved on more than one occasion to express astonishment at the way the men went through their evolutions in view of their short training. During the training, stoppages were purposely caused in various manners, such as by secretly turning off the petrol, or loosening a wire, and the men had to locate and remedy the trouble. All sort of devices have been adopted to prevent the machine working, and on some occasions no less than three different things were done, any of which would prevent the machine running.

Taking the men all round who have passed through the Excelsior School, they appear to be above the ordinary average of intelligence, and are most anxious to get efficient. Of course, it is to be expected that one or two will be slower in grasping the mechanical points at once, but it is generally found they have caught up their companions by the end of the week.

They come from all parts of the British Empire—North, South, East, and West—all with one idea to serve their country. When imbued with such a spirit, it is our duty, and at the same time a pleasure, to do out utmost to assist them to attain their ideal.

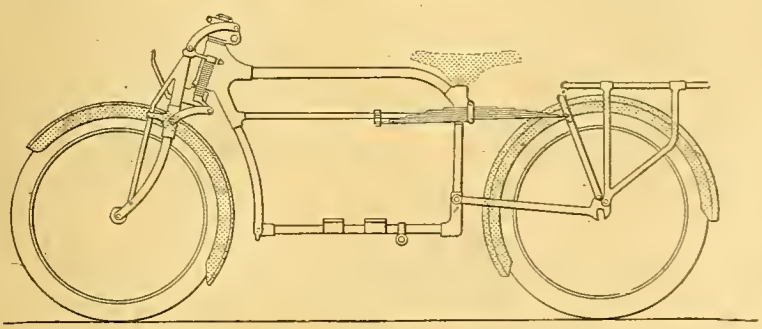


H. J. Aplin and family, of Birmingham, on tour. The machine is a 6 h.p. New Hudson, which has given every satisfaction.

A Douglas Spring Frame.

Cantilever System of Springing applied to Motor Cycles.

DOUGLAS BROS. are not the kind of firm to allow the grass to grow under their feet; consequently it is not surprising to note among the recent patents applying to motor cycles a design for a Douglas spring frame. We illustrate a system covered by the patent specification, which, it will be agreed, is extremely neat in appearance and promises to be extremely effective in its operation. It will be noticed that unsprung weight has been reduced to a minimum. Two cantilever springs are employed; these are attached to the main frame at their forward extremities, and again at their centres by a clip which is pivoted to the seat tube, while the rearmost point is attached to the back stays. The reason for these two attachments to the main frame is to prevent any lateral movement of the back wheel. The chain stays are pivoted to the main frame, and to these the carrier is secured, being again supported at the top.



The Douglas patent spring frame for motor cycles.

A 250 c.c. Power Unit Weighing 23 lb.

Details of a Remarkable High-speed Engine built by the A.B.C. Company for Government Work. "Road Rider's" Impressions.

FINDING myself in the Hersham district the other day, I called in at the A.B.C. works and spent a most interesting hour with Mr. Granville Bradshaw. I am afraid it will disappoint many enthusiasts to hear that the output of A.B.C. motor cycles, as with many other British makes, is almost entirely suspended. The research work in connection with the 1916 models is proceeding in odd moments, as a preparation for calmer days, and I saw the experimental engines and frames (now far advanced towards perfection) of the famous Model C, which is expected to do 90 m.p.h. on Brooklands, and weighs no more than 150 lb. all on.

A Really Lightweight Engine.

As I walked about the toolshops, I became increasingly conscious of an earsplitting uproar outside. "Oh, that is our new lightweight!" I went to investigate, and discovered a horizontally-opposed steel cylinder twin, 60 mm. × 44 mm., undergoing a six hours' test in the open air. With a fan brake attached it was running at over 4,000 r.p.m. and developing over 4 h.p. The entire power unit weighs no more than 23¼ lb., of which the magneto scales over 7 lb. and the automatic Claudel-Hobson carburetter very nearly 2½ lb. The absence of vibration is so extraordinary that if a finger is pressed on the magneto at high rates of r.p.m. it is difficult to determine by touch alone whether the engine is running or not. This 23 lb. outfit is employed for starting up huge engines on seaplanes, airships, and motor boats, and replaces far more cumbrous alternatives; in fact, the lightest engine starter yet applied to such purposes (an electric dynamo) weighs nearly four times as much. What a fascinating baby bicycle could be rigged up with this delicious little engine, the workmanship of which is absolutely superb!

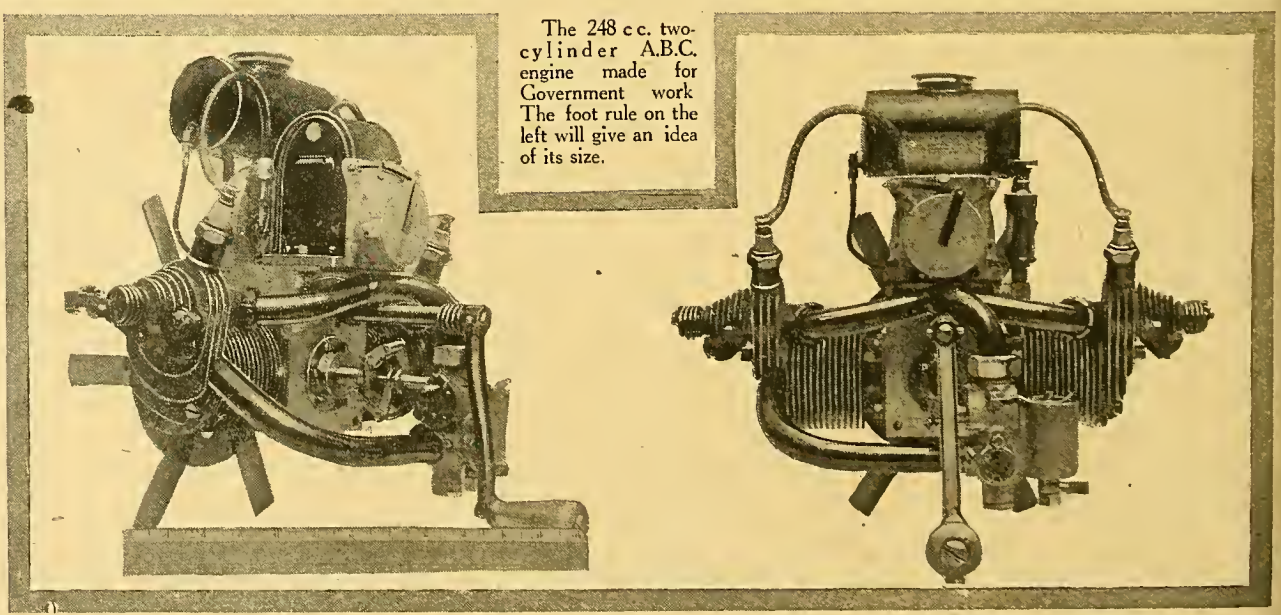
Apart from the experimental 1916 models, the only cycles coming through were a few spring-framed machines ordered by the Government for a district where rigid frames are officially considered impracticable. N.B.—The War Office considers spring frames unnecessary in France and Flanders.

In the engine department the two-throw crankshaft of a colossal aviation engine was one of the most interesting exhibits. Imagine seven connecting rods crowded together on each of two crank pins, the length of each pin being about 5in. Yet with roller bearings these dimensions are found quite practical.

Increasing Cooling Capacity.

The big lathe turns out a completely machined cylinder for the 3½ h.p. 500 c.c. engine in thirty-five minutes, the fins being machined and the bore drilled out at one operation. This time economy renders the steel cylinder cheaper than the ordinary iron castings. Mr. Bradshaw was very "cockahoop" over a wee discovery anent the treatment of the cylinder bore. The alteration from standard methods of finishing the bored surfaces results in the engine keeping 20% cooler, *e.g.*, with the big aviation engines the radiator surface can be reduced to that amount, with valuable economies in weight. On the air-cooled cycle cylinders the risk of overheating is correspondingly eliminated. A very neat mechanical oil pump will figure on all models when manufacture resumes its normal round.

I have seldom visited a factory where magnificent workmanship and a high degree of technical knowledge were so happily combined, and I venture to prophesy that the A.B.C. machines will achieve a formidable reputation alike on road and track when once motor cycling settles down to routine work again.



The 248 c.c. two-cylinder A.B.C. engine made for Government work The foot rule on the left will give an idea of its size.

A 250 c.c. Power Unit Weighing 23 lb.—

In the meantime, the works are keeping their hand well in with the 500 c.c. air-cooled pattern, which is in great demand with the services for running the dynamos of portable searchlights, in which duty it represents a great saving of weight as compared with all substitutes. Overheating is prevented by an enormous fan, some eighteen inches in diameter, which keeps the engine so cool that twelve hour tests at full revolutions result in no injury to the bearings, and in no diminution of power output. We may, therefore, expect the road models to be better than ever when peace returns, and we may dream of a very fascinating lightweight when the 23 lb. 250 c.c. vibrationless engine makes its *début* in a cycle frame. Its steadiness is evinced by the fact that it does its power tests clamped in a medium-sized parallel vice laid on the ground outside the running shed!

Some engineering details of the highly interesting 248 c.c. A.B.C. engine referred to in the foregoing notes are given hereunder:

Engine alone weighs	14 lb.
Magneto weighs	7 ,,
Carburetter weighs	2¼ ,,

Power developed: 2 h.p. at 2,000 r.p.m.
3 h.p. ,, 3,000 ,,
4 h.p. ,, 4,000 ,,

As an experiment, the engine has been run on full throttle without any load, and has attained the remarkable speed of 8,000 r.p.m. This is probably a world's record for a reciprocating engine.

The crankshaft is fitted with A.B.C. roller bearings, and weighs 15 oz., a complete connecting rod weighing 2 oz.

Mechanical lubrication is employed in the shape of a gear-driven oil pump, which is fixed to the crank case cover and runs at one-fifteenth engine speed.

RELIABILITY TRIAL IN WICKLOW.

AN afternoon reliability trial was held on Saturday last by the Dublin and District Motor Cycle Club over a course that embraced a good deal of the hill country of Co. Wicklow. The crucial part of the competition was the ascent of Ballymacroe Hill, a long and steep ascent that leads from the low lying country near the coast to the watershed of the Vartry. The lateness of the season and the large number of competitions that have been held recently in Ireland caused a falling off of interest in the concluding events, and Saturday's trial seemed hardly called for.

The route started from Donnybrook, and passed through Bray, Kilmacanogue, Newtownmountkennedy, Ashford, Ballymacroe, Roundwood, Calary, and Sugarloaf, joining the outward route at Kilmacanogue, and returning by Bray. Non-stop conditions had to be observed from the start to the first check at the summit of Ballymacroe Hill. With the exception of J. Cunningham (7-9 Indian), who was suffering from a slipping clutch, all the competitors made clean ascents of Ballymacroe, and at the check the only ones to lose marks were S. Allen (3½ James) and W. J. Henderson (7-9 Harley-Davidson sidecar). Henderson retired, as full marks were necessary to secure an award. At the Roundwood check Miss "Nomen" was 9 min. late, having taken a wrong turning after Ballymacroe.

The following completed the trial:

J. White (2½ Sun)
G. Hartigan (3¾ Scott)
S. Allen (3½ James)
J. Cunningham (4 Bradbury sc.)
Miss "Nomen" (10 A.C. light car)
J. Cunningham (7-9 Indian sc.)
R. Walshe (4 B.S.A. sc.)
J. Browne (3½ Rover)
D. Allen (2½ Sun)
G. Mayne (10 Calthorpe light car)

An Ingenious Spring Frame.

WE recently inspected an ingenious design for springing the rear frame of a motor bicycle produced by an enthusiastic motor cyclist, Mr. W. Mason, 58, Coleridge Avenue, Manor Park, Essex. Mr. Mason has protected the design, which strikes us as being ingenious and capable of further development. The sketch renders the working of the device self-explanatory. Fig. 1 shows the original design, which we think quite good, provided the bearing surfaces are of ample dimensions, and the spindles are supplied with grease cups so as to ensure the moving parts being adequately lubricated. The cost of manufacture would be slight, and we do not see why the device should not be successful. Fig. 2 shows another suggested form, in which the same principles are embodied, the chief improvement being that there are springs top and bottom at the forward end of the link, so that the device would be smooth working and the rebound would be absorbed, which is not the case with the single coil spring. The latter method also has the advantage that it does not in any way interfere with the space available for accommodating the tank. We also think the device could be made to work equally well with a leaf spring, which we consider would be a still further improvement. This spring frame is not yet on the market.

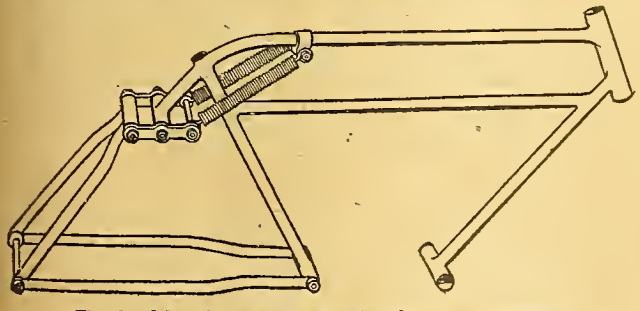


Fig. 1.—Mason's patent rear spring frame as at present designed.

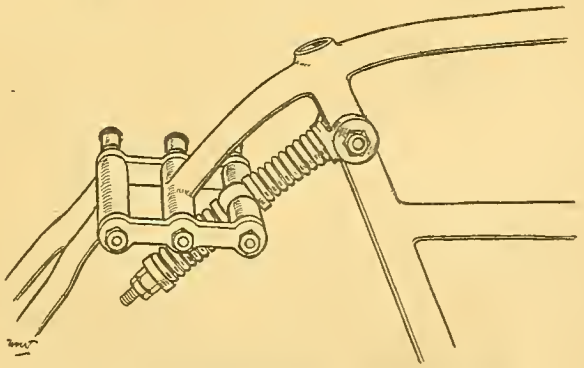

Fig. 2.—A suggested improvement. Note the grease cups

The Latest Index Mark.

The county of the West Riding of Yorkshire has had assigned to it the identification letters WR, in addition to the letter C.

A Lancashire Police Trap.

Motor cyclists are warned that a trap is working at the present time between Belmont and Withnell on the Bolton-Blackburn road.

Contribution to War Fund from Hill-climb.

As a result of the Pen-y-Ball hill-climb, reported in the last issue of *The Motor Cycle*, the Liverpool Motor Club have handed over £15 15s. to the Holywell Wounded Soldiers' Fund.

Enfield Co.'s Balance Sheet.

The directors of the Enfield Cycle Co. have resolved to recommend the following dividends: On the A preference shares, 7%, less income tax, for the half year ended August 31st last; on the B preference and the ordinary shares 20%, free of income tax; and a distribution of one fully-paid ordinary share for every five existing shares, B preference and ordinary, held in the company, subject to the consent of the B preference shareholders and the Treasury as to the increase of capital necessary to carry out the scheme.

Important Regulation of the Postal Censor.

The attention of readers is called by our publishers to the following important regulation issued by the Postal Censor: "All newspapers and books intended for neutral countries must be despatched either from the publishing offices or from the office of a newsagent or of a bookseller, and must be enclosed in a wrapper bearing the name and address of such agent." Under this regulation copies of *The Motor Cycle* must not be posted to neutral countries by private persons, neither may addressed wrappers be supplied to newsagents or booksellers. Readers who wish to send copies of this journal abroad may, however, continue to do so by placing a subscription order for a period of three, six, or twelve months either with a newsagent or direct with the publishers. The rates are the same in either cases, *i.e.*, 15s. per annum (Canada, 10s. 10d.) and *pro rata* for shorter periods.

A Worthing Road Improvement.

Motorists who have had occasion to travel over the portion of the main Worthing Road over the bridge between Capel and Kingsfold, where road surface conditions have for the past few months been extremely unsatisfactory, will learn with pleasure that, as a result of efforts made by the Automobile Association, the responsible authorities have now promised to remedy matters.

A Year's American Motor Cycle Exports.

An idea of the growth of the American motor cycle exports is provided by the figures representing numbers of motor cycles exported from the States during each month from July, 1914, to June 30th last:

	Number. 1914-15.	1913-14.
July	501	273
August	186	238
September	117	211
October	507	204
November	83	89
December	146	379
January	525	390
February	724	908
March	578	878
April	1,274	1,165
May	1,392	1,079
June	2,133	596
Totals	8,166	6,410

The respective values were $1,494,176 and $1,234,194.

IN FIELD KIT OF THE M.M.G.S.

Battery Sergt.-Major Palmer, of the Motor Machine Gun Service, who, after serving for several months in France with the No. 5 Battery, is now back at the training centre as an instructor. Sergt.-Major Palmer had formerly seen service overseas in the Royal Navy, and was assistant cashier to *The Motor Cycle* prior to joining the M.M.G.S.

SPECIAL FEATURES.

TRAINING CYCLISTS FOR THE M.M.G.S. (Illustrated).

EFFECT OF THE NEW IMPORT DUTY.

THE ARMY AND NAVY HILL-CLIMB (Illustrated).

M.C.C. Secretary Promoted.

We have received a very cheery letter from Southcomb May, hon. sec. of the Motor Cycling Club, who joined the Motor Machine Gun Service some weeks ago. May has just received his second stripe, and speaks very highly of the Service and how much he is enjoying it. So far the new batteries have done little motor cycling, but the Scotts formerly used by a disbanded section are being pressed into the service of the M.M.G.S. for training purposes.

Average Prices.

We give below the average prices for the various second-hand models offered for sale in the last issne of *The Motor Cycle*. We quote those machines of which at least five weekly averages have appeared in the past two months, and where it is possible to obtain a sufficient number of each model we give the average for the past week:

Make.	Year.	H.P.	Last week's average.	Average for past 8 weeks.
A.J.S.	1914	6 3-sp. sidecar	£74	£75
,,	1913	6 3-sp. sidecar	£55	£57
,,	1914	2¾ 3-speed	—	£44

,,	1913	3½ 3-sp. sidecar	£45	£45
Williamson	1914	8 2-sp. sidecar	£74	£74
Zenith	1914	6 Gradua sidecar	—	£64

New Hudson's Record Profits.

The New Hudson Cycle Co., Ltd., has made the largest profit for years past, the figures for 1914-15 being £27,834, compared with £3,614 for the previous year. A dividend of 20% is being paid.

Motor Spirit and the Budget.

Prices of petrol existing on Tuesday last were as follows:

No. 1, 2s. 1d. per gallon.
No. 2, 2s. per gallon.
Mex and Taxibus 1s. 11d. per gallon.

A Stolen Machine.

A James two-stroke, two-speed motor cycle was stolen recently from outside the Hippodrome, Derby. The registration number was R 2789, though the thief would no doubt change this without delay. The owner, Second Lieutenant L. S. Innes, 25, Wardwick, Derby, would be glad of information which would lead to the recovery of the machine.

The Petrol Tax.

Second-grade petrol is now 1s. 11d. to 2s. per gallon. It seems an appallingly high price to an Englishman, but it has cost as much for years in France, and in Italy it is half a crown a gallon in times of peace and prosperity. Petrol has been sold more cheaply in England than in any other country except America.

Side-by-side Valves on 1916 7 h.p. Indian.

The 1916 model Indians have just made their appearance in the States, but they differ from the 1916 models which will shortly be introduced to English motor cyclists. The details must for the time being remain a secret, but the opinion of the Indian tester who gave the new 7 h.p. side by side valve model an exhaustive test (covering 1,655½ miles in 3 days 9 hours 15 minutes) is interesting and amusing. He writes: "Take it from me that you have made a motor that is a world beater on all kinds of roads. I'll stack it against all creation to bring home the bacon anywhere, any time. It's a bear, a big, husky, lick-all-comers machine—that 1916 Indian. It hits me where I live."

Tariff Tattle.

The new import duty of 33⅓% on foreign-made cars, motor cycles and parts (including tyres and accessories) came into effect yesterday (Wednesday).

Motorists want to know why the petrol distributers saw fit to add another twopence to petrol, making fivepence a gallon increase.

"The Motor Cycle" opines that one good effect of the Budget will be to induce American manufacturers to send their machines over to this country minus mudguards, chains, tanks, rims, and tyres, and arrange for these to be fitted on arrival in this country. In this way the tariff would largely be avoided and the British accessory maker would benefit to a considerable extent.

Generally speaking, the new import duty has been favourably received by motorists. It was clear that something must be done to protect the important British industry, whose hands were tied, so to speak, manufacturing the all-important munitions. No Britisher objects to healthy competition in normal times.

Road Information.

We have received information that the road from Bury Hill, Arundel, and right along to Portsmouth is in a very bad condition, especially in Emsworth. Our informant returned through Petworth to Oxted and found the surface much better.

Is this the Latest?

The Bristol Motor Cycle Club held on Saturday last a "nutting" competition near Chipping Sodbury, the winner of which was the person who secured the greatest number of nuts in a given time. We are assured that it was a great success, being especially enjoyed by the many children brought in sidecars.

Postcards of Despatch Riders.

A series of pictorial postcards of despatch riders has been issued by Douglas Bros. They are exceedingly well produced, and many well-known Douglas riders are included. The Douglas Co. will be pleased to forward complete sets to any of our readers.

A Revenue Tax Rumour.

Before the new Budget was announced there were strong rumours in Midland motoring circles that the taxes on foreign-made cars and motor cycles were to be doubled, as well as a tariff placed on future imports. But the tax remains as before, so that owners of foreign motor vehicles may breathe a sigh of relief.

Too Bright Head Lights.

According to *The Evening Standard*, "several motor cyclists were fined at Willesden for having too brilliant head lights and too little at the rear—insufficient to illuminate the identification plate." Surely this is incorrect, as it is not obligatory for motor cyclists to illuminate the rear number plate, as inferred. We thought that everybody knew that motor cyclists might illuminate either the front or rear number plate, although now they must exhibit a red light to the rear.

The National War Funds.

At the week-end the principal relief funds stood as follow:

	£	s.	d.
National Relief Fund ...	5,498,342	0	0
The Times Fund ...	1,679,466	0	0
The Queen's Work for Women Fund	165,076	14	0
The Weekly Despatch Tobacco Fund... ...	84,209	0	0
France's Day collection	40,000	0	0
Belgian Relief Fund exceeds	930,887	0	0

High Speeds in America.

A 300 miles track race was held at Chicago on September 12th, and some big speeds were put up. Most of the American crack riders competed, and competition was very keen. The first three places were secured as follow:

	H.	M.	S.
Goudy (Excelsior)	3	29	51⅔
Carroll (Indian)	3	35	17
Weishaar (Harley-Davidson) ...	3	35	44

Goudy's average speed was 85.71 m.p.h., and it is claimed to be a world's record. He covered the 200 miles at a speed of 86.76 m.p.h. The time for the 100 miles was higher still, *i.e.*, 89.11 m.p.h., this being made by Otto Walker on a Harley-Davidson. Both these times are records. There were twenty-five starters.

Care Required at Llandudno.

Complaints have been made concerning the speed of motor cyclists and car drivers at Llandudno. The council discussed the matter a few days ago, when all forms of mechanical transit, including tramcars, came in for denouncement owing to their alleged excessive speed.

The Athletes' Volunteer Force.

The Athletes' Volunteer Force, now known as the 10th Essex Volunteer Battalion, is forming a motor cycle section. All those in the district who are interested should communicate with Mr. Mitchell, 57, Mortimer Road, East Ham, who will give any information.

The Effect of the Petrol Tax.

The increase in the cost of petrol owing to the recently imposed petrol tax has caused a number of our readers to enquire as to the running of their motor cycles on benzole. Unfortunately, as the whole of the output of this fuel has been taken by the Government, motorists have no alternative but to pay a price for petrol which our Continental neighbours have been paying for many years.

What made him Escape.

Sergeant Birley, of the Gloucestershires, was taken prisoner by the Germans at the battle of Ypres on October 29th, but has succeeded in making his escape from a German prison camp. He was congratulated by H.M. the King on his success, and told the King that the idea of escaping occurred to him when it came to his knowledge that his brother, a despatch rider in France, had been awarded the D.C.M. for his plucky action in delivering his despatch on foot, and under heavy fire, when his motor cycle had been smashed by a shell. He says, "On hearing that I thought, 'Well, if he can do that I am going to do something,' so I made up my mind to escape, and here I am."

The Motor Cyclist Munition Workers' Competition.

There seems to be no doubt that sufficient support will be forthcoming to warrant holding a competition for motor cyclist munition workers, as suggested by a correspondent in our last issue. Just what form the event will take is a moot point at present. Both the Auto Cycle Union and the Wolverhampton Motor Cycling Club have expressed their interest in the idea, and, whilst the A.C.U. suggest a reliability trial, the Midland body favour a hill-climb at Style Cop, and at a committee meeting on Monday evening when the matter came up for discussion went so far as to suggest Saturday, October 23rd, as the date of the event. At the moment there is difficulty in defining a munition worker. The official war badge would be the best guide, but might restrict entries unnecessarily. The Wolverhampton Club Committee is meeting again in a day or two to consider the matter further.

Other Midland club representatives have not passed over the suggestion in *The Motor Cycle*, and we personally favour the idea of all the Midland motor cycle clubs combining in organising this event, the proceeds to provide comforts for our motor cyclist colleagues on active service.

HAPPY SEQUEL TO A MOVABLE LAMP FINE.

THE police in certain districts continue to take action against movable lamps, and, however good the defence, the motor cyclist seldom, if ever, gets off. A lady rider of a sidecar outfit, whose experience is reproduced below, was fined £5 for having a lamp that did not comply with the regulations, though the lamp was minus generator and connecting pipes, and was incapable of being used. The sequel, however, was quite a happy one, as the following letter from a lady motor cyclist shows:

"On August 20th I was driving my motor cycle and sidecar through Langley at 12.15 p.m., when I was stopped by the police for carrying a lamp which was capable of movement independently of the machine. I pointed out to the police that it was quite incapable of being used, as there was no generator, bracket, or connecting pipes, only the projector being present, and that it was a second-hand machine, and the lamp had never been intact since my purchase of it in May last. On September 8th I was fined £5 at Slough Police Court, and the lamp was confiscated.

"Having seen that Messrs. J. Lucas, Ltd., had presented the first man carrying a Lucas lamp, which the police had confiscated, with a new lamp, I applied to them as being the first woman to be so treated. The response was most generous, and Messrs. Lucas agreed that the same treatment should apply equally to men and women, and I have now received the lamp, which complies with the new regulations."—C. M. A. COOMBS, L.L.A.

THE WARD TWO-STROKE LIGHTWEIGHT.

ONE of the latest additions to the already long list of two-stroke lightweights is the Ward, which is manufactured by Messrs. William Ward and Sons, motor engineers, Wetherby. This machine, though low in price, is substantially built; it is fitted with a 2¾ h.p. engine, and a large exhaust pipe and silencer. The gas is supplied by a Senspray or Amac carburetter and ignited by an E.I.C. magneto of British manufacture. Druid girder forks are fitted, the wheels are 24in., and the tyres 2in. in section; these latter may be Clincher, Kempshall, or Avon. The lubrication is on the semi-automatic system, which the makers prefer to petroil, a Best and Lloyd drip feed pump being employed. The rear brake is applied to the belt rim by the left heel.

The machine is enamelled in black with gold lines, which gives an excellent appearance. A Lycett saddle is fitted, and a Lyco ¾in. belt. The riding position is low, being about 28in. from the ground, and the weight of the machine is 120 lb. The bottom bracket is so constructed that it can carry a gear box without alteration; for this an extra charge of six guineas is made. Two armoured toolbags are attached to the carrier, one on either side, and the handle-bars may be of touring or semi-T.T. pattern.

It is hoped shortly to turn out these machines in considerable quantities.

"THE MOTOR CYCLE" IN THE CAMEROONS.

IN a letter addressed to Mr. Alec Ross, Captain G. Sambidge, now in the Cameroons, says that he has not lost interest in motor cycle matters, and *The Motor Cycle*, which he receives regularly, is exceedingly welcome. Captain Sambidge will be remembered by both trade and private owners through his connection with the E.I.C. Company and as secretary of the Midland Light Car Club.

AN AEROPLANE FIGHT.

WE have had an interesting letter from M. A. J. Orde, who is the son of Mr. Julian Orde, secretary of the R.A.C. Orde was formerly an enthusiastic rider of a T.T. Rover motor bicycle, and is well known in the Midlands. He came over from Havana to serve his country, and received a commission in the A.S.C.,M.T. He found this work too dull, and succeeded in getting transferred to the R.F.C., where he has been acting as observer in an aeroplane during practically the whole summer. He writes: "I have had a lot of fun lately—two fights in the air. The first was not much, as when I had give the old Hun about twenty shots from machine gun he went home. The oth was more exciting, as two Huns attacke us at the same time, so I was kept bus The first one I shot, and he sudden disappeared, so I started on the othe which soon ran away. When I land I was told that I had brought the fir fellow down. The second fellow hit u as there were six shots, four quite clo to me, about a foot on either side, a I could hear them going by, but was excited that I really did not know th were so close to us. We are very bu now and working hard."

POSSIBILITY OF AN AUSTRALIA M.M.G.B.

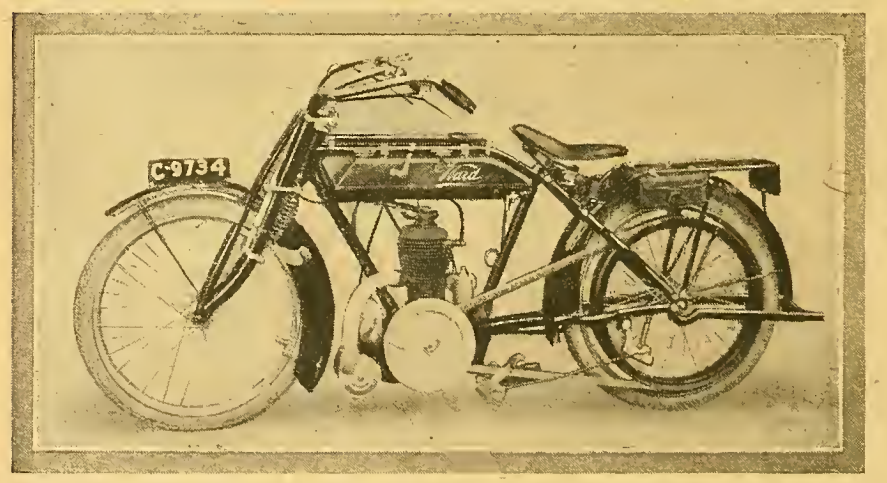
WE recently referred to the possibili of a Motor Machine Gun Batte being recruited in and arou Perth, Western Australia, and comi over to this country to take up duti with the Motor Machine Gun Servi This is the outcome of a letter receiv from Mr. J. W. Armstrong, of Per W.A., the secretary of the West A tralian Motor Cycle Club, to the Edit of this journal, who, in his capacity an inspecting officer of Army mo cyclists laid a plan before the commar ing officer of the M.M.G.S., and sancti is now forthcoming for the getti together of a contingent of motor cycli from the Antipodes, and, furthermo the C.O. has promised to do his b to keep the men together. In writi to us, Mr. Armstrong mentions that th are at least a thousand experienced mo cyclists in Australia, good riders and good positions, who prefer to join section of the Army of which they kn something. So far, he states, only twe riders have been sent from Australia despatch riders, and these men w mounted on 4¼ h.p. single-gea machines.

Already a considerable number of mo cyclists have left Australia—indeed, number are now serving in the ranks the M.M.G.S.—and others are think of doing the same, paying, of cour their own fares from Australia to Old Country.

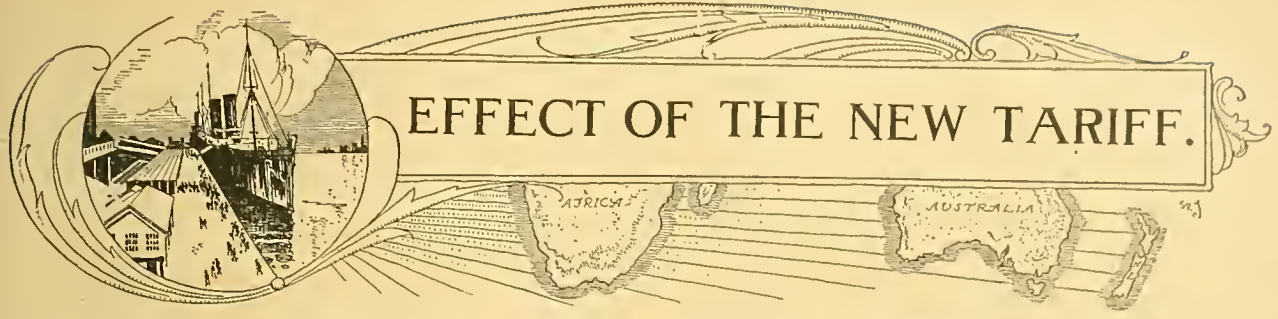
10TH (MID-SURREY) MOTOR CYCLE VOLUNTEERS.

THE A Company of the 1st Mo Cycle Battalion Volunteers linked up with the 10th (M Surrey) Volunteer Training Corps, county battalion established in Dorking district, and will now fo the motor cycle signal section of t corps. The men have at least months' hard work before them, wh will be spread over various eveni in the week and at week-ends. Spe road maps are to be prepared by motor cycle section, detailing exa what routes are best available transports and troops, and how m men could be billeted, if necessa in the surrounding villages betw Merstham and the coast.

The 10th (Mid-Surrey) Volunteer C is commanded by Mr. H. H. Gor Clark, and the adjutant and secret (who will welcome eligible recruits o the military age) is Mr. R. M. Aitk Rough Rew, Dorking.



The newest two-stroke—a 2¾ h.p. Ward made by a Yorkshire firm.



EFFECT OF THE NEW TARIFF.

How the Prices of Foreign-made Motor Cycles and Parts will be advanced by reason of the Import Duty of 33⅓ % ad valorem.

INTERVIEWS WITH LEADING IMPORTERS.

Pope.

MR. CHARLES SEEMAN, agent for the Pope, mentioned that he had not given the matter sufficient consideration to be able to declare his future policy; but he viewed the matter in a very patriotic spirit, and thought it right that people should pay for the pleasures they enjoy during war time. He could say, however, that the full duty would not be added to prices at present in force. His company, by being content with a smaller profit, would give the public the benefit.

Excelsior.

Mr. W. G. Harris, of Harris and Sons, agents for the Excelsior motor cycle, stated that he would have to add the full 33⅓% tax to the cost of his machines. He was, however, so far confident of their excellence that he felt the public would continue buying.

Harley-Davidson.

Mr. Victor Welsford, the general manager of Messrs. Harley-Davidson, said that the Harley-Davidson, despite the tariff, would still be in competition with English machines of equivalent value. We had to be thankful that the tax was also applied to cars, and he considered that this would, in a way, be a great benefit, as people would find cars too dear, and, consequently, would buy motor cycles, in view of the far greater economy of these vehicles. In spite of the tariff and the war, his firm had moved into what were probably the largest premises occupied by any motor cycle firm in the British Isles, and he thought that really the tariff would be an advantage rather than otherwise. At the present time they were busily engaged in getting the various agents' opinions, and he could not say anything definite about the prices at the moment. He considered that now was the English manufacturers' great opportunity.

American Magnetos.

Mr. H. J. Hinley (American Supplies Co., agents for the Splitdorf and Dixie magnetos, etc.) stated that he feared his firm would have to put the whole tariff on to the prices of the articles they sold. Before the war the prices for their magnetos had been lower than those of the Bosch people, and they had only been compelled to add 5% to cover war risks, increased freights, etc. He viewed the tariff in a very generous light, and did not think it would affect their sales in the slightest degree.

Motosacoche.

Mr. de Lissa (Motosacoche, Ltd.).—From a patriotic point of view, Mr. de Lissa was thoroughly in agreement with the tariff, and for a long time he had felt that it must come, though, naturally, his firm would feel the effect considerably. He would be reluctantly compelled, as far as he knew, to add the tariff to the existing price.

Henderson.

Mr. Robertson Brown, Robertson Motors, agents for Henderson and Harley-Davidson, stated that it was quite right that America should pay for the privilege of having the British trade. He considered that the public would still buy motor cycles, but help for the English agents must come from the manufacturers. Whatever increase of price had to be placed upon the Henderson, he thought it would be a small one; at the present moment, he had decided to make no advance at all. Sparking plugs might be slightly dearer in the future, but for the moment there would be no advance.

Thor.

Mr. Belford (Messrs. Watkins and Harding, the agents for the Thor) stated that his firm would have to increase their prices, but he hoped that it would not be necessary to put on the full tariff. He thought that the tax was quite right, and would give the English manufacturers a wonderful opportunity if they would only rise to the occasion.

Indian.

Mr. W. H. Wells, when interviewed with regard to the possible effect upon the price of Indian motor cycles in view of the new import duty of 33⅓%, told us that it would be the Hendee Co.'s policy to cut down the profits to the minimum and exercise the greatest economy all through the different departments. Though there was bound to be an increase in the price of Indian motor cycles, he did not think it would be to the full extent of the tariff. Mr. Wells reminded us that the Indian has never really been all-American, for the chains, tyres, saddles, and usually mudgnards and certain tank fittings have been made in this country. The Indian should, therefore, get a pull on this account. In view of contemplated changes in the 1916 models, the London manager of the Hendee Co. is confident that his machines will remain an attractive proposition even at the enhanced prices. As a matter of fact, the tariff came as a great surprise to the company, who had settled upon their 1916 programme, and, indeed, we were shown printed leaflets with the prices of the 1916 models all set out. These must, however, be revised.

An addition to the Indian range for 1916 is a 2½ h.p. two-stroke lightweight, which is referred to in more detail on another page of this issue.

Views of Accessory Factors.

Mr. Ernest Brown, Brown Bros., Ltd., was not prepared to discuss the matter at length, but said that a tax on similar goods to those that are manufactured in this country will be an interesting experiment, and may also teach us many things.

Goodrich Tyres.

Mr. E. R. Branston, the B.F. Goodrich Co., speaking as a private individual, thought that the tariff would not throw the business of his company out of the normal, nor affect their standing with other manufacturers. There was no intention of increasing prices at the present moment. He thought the tariff to be wholly unnecessary, but if the Government wants money it is not for the traders to criticise.

Jones Speedometers, etc.

Mr. F. E. Dickinson, Markt and Co., considered that the tariff must have some effect upon the buyer, but it was too early to make any definite statement at the present moment.

Stewart Speedometers.

Mr. H. Edis, the Cooper-Stewart Engineering Co., was very doubtful in his mind as to what was meant by "parts." In any case, the tariff would make no difference whatever to the price of their speedometers. Tariff, or no tariff, he intended to keep the prices uniform. He considered that the tariff was just, as money was needed, and there was no real reason why the American importers should not be hit.

The Army and Navy Open Hill-climb.

80 Entries. Comparatively Few Spectators. A Two-stroke Lightweight Wins Four Events on Formula.

At the starting-point of the Army and Navy hill-climb. Lieut. F. L. Bassett (2¾ h.p. Douglas) preparing to start in Class III., which he won.

PROBABLY the last meeting of the season to be held near the Metropolis was the Army and Navy open hill-climb organised by the Streatham and District Motor Cycle Club, and run off on Saturday afternoon on the north side of Newlands Hill leading to Newlands Corner. There were about eighty entries, and not very many spectators on the hill, as its name and position had not been announced, with the object of preventing competitors practising before the event. Saturday was a beautiful day, and the afternoon was warm and sunny.

Originally this event was announced as an Army *versus* Navy hill-climb, but fortunately abandoned, as, in view of the lack of entries from naval motor cyclists, such an event would have proved impossible.

An Easy Climb.

The competitors were marshalled at the foot of the hill in their numerical order, and here Mr. W. Cooper excelled in his duties as starter. The hill is quite an easy one, but eminently safe, as it is a county council road, and rises abruptly in its first section, where the steepest portion is 1 in 8, and then eases off to a consistent 1 in 15-20 until the finish. The course is a favourite run for the London motorist who enjoys an afternoon's spin from London, as it leads to Newlands Corner, one of the most famous Surrey beauty spots; consequently there is usually plenty of traffic, but last Saturday there was fortunately not a great deal, and on the whole, thanks chiefly to the comparatively small entry, the competition was fairly smartly run off. The first man, Sergt. Milner, was sent off at 2.10 p.m.

CLASS I. STANDARD TWO-STROKE MACHINES WITH ENGINE CAPACITY NOT EXCEEDING 270 C.C. (no machine was taken as weighing more than 125 lb. in this class).—This was a walk-over, as there was only one starter. Result:

	Bore and Stroke.	c.c.	Fig. of Merit.
Sergt. A. Milner (2 Levis)	60 × 70	198	579

CLASS II. STANDARD MACHINES UP TO 350 C.C. (no machine was taken as weighing more than 150 lb. to obtain results on formula).—Wood (A.J.S.) was stopped owing to traffic, but on his second attempt made a good performance. Second-Lieut. Dreydel and Lieut. Bassett came up in excellent form. Milner (Levis) again distinguished himself. Result:

	Bore and Stroke.	c.c.	Fig. of Merit.
1. Sergt. A. Milner (2 Levis)	60 × 70	198	624
2. Lieut. F. L. Bassett (2¾ Douglas) ..	60.5 × 60.5	349	415
3. C. P. Wood (2¾ A.J.S.)	74 × 76	327	348

CLASS III. STANDARD DOUGLAS MACHINES (no machines were taken as weighing more than 150 lb. to obtain results on formula).—Sergt. Barker was riding an overhead valve Douglas, which started off at a good healthy pace in a cloud of blue smoke, but, owing to a stuck ball valve in his oil pump, the lubricant ran through into the crank case, and he stopped with a fouled rear cylinder plug. Then the news came through that he had been disqualified, as the machine was not considered a standard mount. Despite the fact that his engine was missing fire, Lieut. Bassett made a good ascent. Result:

1. Lieut. F. L. Bassett (2¾ Douglas) ..	60.5 × 60.5	349		363
2. Lance-Corpl. Thompson (2¾ Douglas)	60.5 × 60.5	349		293
3. 2nd Lieut. Dreydel (2¾ Douglas) ...	60.5 × 60.5	349		270

CLASS IV. STANDARD MACHINES UP TO 600 C.C. (no machine was taken as weighing more than 200 lb. to obtain results on formula).—Milner again put up a fine performance, though his gallant little machine was pitted against others of nearly three times its cubical capacity. We were pleased to see that Capt. Huntbach's Premier with Philipson pulley, which behaved so well at the United Services meeting at Brooklands on the 4th inst., made a capital ascent. Wood (A.J.S.) again distinguished himself, while the running of Wright's 4 h.p. Triumph and Miller's Blackburne was much admired. Bassett (Douglas) broke a belt fastener half-way up the hill. Result:

1. Sergt. A. Milner (2 Levis)	60 × 70	198		490
2. C. P. Wood (2¾ A.J.S.)	74 × 76	327		450
3. Capt. Huntbach (3½ Premier)	83 × 85	460		409

CLASS V. STANDARD MACHINES UP TO 1,000 C.C. (no machine was taken as weighing more than 275 lb. to obtain results on formula).—In this class, as in the one preceding, the entries were good. Engelbach's Indian created a considerable amount of favourable comment owing to its fast and silent running. Lance-Corpl. Wardlaw (8 h.p. Zenith) was

The Army and Navy Open Hill-climb.—

travelling well, but, mistaking the finish, stopped long before he reached the end of the measured distance. Bassett (Douglas) again experienced belt trouble, and the victorious Milner again came out top. Charlesworth (5 h.p. Zenith) came up in fine form. Result :

	Bore and Stroke.	c.c.	Fig. of Merit.
1. Sergt. A. Milner (2 Levis)	60 × 70	198	570
2. C. P. Wood (2¼ A.J.S.)	74 × 76	327	463
3. R. Charlesworth (5 Zenith)	76 × 82	744	410

CLASS VI. STANDARD INDIAN MACHINES ONLY (no machine was taken as weighing more than 275 lb. to obtain results on formula).—This was the second of the "one-design classes," and, like its predecessor, was not well supported, which is a pity, as the manufacturers interested gave handsome cups as prizes, and such events are to be encouraged on account of their sporting nature. Result :

1. P. W. Engelbach (7 Indian)	82.5 × 93	998	269
2. C. P. O. Kingston (5 Indian)	70 × 89	684	—
3. H. Odhams (5 Indian)	70 × 89	684	244

CLASS VII. STANDARD SIDECAR MACHINES UP TO 600 C.C.—Thompson's 4 h.p. Douglas sc. was travelling well, but he spoilt his climb by that oft-committed fault of changing up too early. In this event there were only three starters. Result :

1. Corpl. Wright (4 Triumph sc.)	85 × 97	550	366
2. Private Miller (3½ Blackburne sc.) ..	85 × 88	499	339
3. Lce.-Corpl. Thompson (4 Douglas sc.)	74.5 × 68	594	290

CLASS VIII. STANDARD SIDECAR MACHINES UP TO 1,000 C.C. —Thompson, profiting by his experience, kept in his lower gear, and made a much better climb, while Sergt. Barker (8 h.p. Zenith sc.) went up the hill at a surprising speed. Charlesworth (5 h.p. Zenith sc.) had trouble with his petrol feed, as his engine stopped several times on the way up, apparently owing to the petrol tap shaking off. Result :

1. Sergt. Barker (8 Zenith sc.)	90 × 77.5	996	318
2. Lce.-Corpl. Thompson (4 Douglas sc.)	74.5 × 68	594	312
3. Lce.-Corpl. Wardlaw (8 Zenith sc.) ..	90 × 77.5	996	197

CLASS IX., for STANDARD CYCLE CARS UP TO 1,100 C.C., was abandoned, as there was only one entrant, who transferred to the next class.

CLASS X. ANY TYPE OF MACHINE (motor cycle, sidecar, or cycle car).—This, the final event, was run off on time, and the three best men of previous classes signally distinguished themselves, Barker's ascent being especially spectacular. Result :

1. Sergt. Barker (8 Zenith sc.)	90 × 77.5	996	*33⅘s.
2. Lance-Corpl. Wardlaw (8 Zenith sc.)	90 × 77.5	996	34⅘s.
3. Capt. Huntbach (3½ Premier)	83 × 85	460	39⅗s.
3. P. W. Engelbach (7 Indian)	90 × 77.5	998	

*Fastest time of the day.

The competitors and spectators then adjourned to the Onslow Arms, West Clandon, where, after a long wait, the special awards were announced. These were as follow :

The cup presented by Messrs. Douglas Bros. to the winner of Class III. : Lieut. F. L. Bassett ; figure of merit, 363.

The cup presented by the Hendee Mfg. Co. to the winner of Class VI. : P. W. Engelbach ; figure of merit, 269.

The cup for the best performance on formula : Sergt. A. Milner (2 h.p. Levis) ; figure of merit, 624.

The cup presented by Mr. A. W. Torkington to the competitor making the fastest time of the day : Sergt. F. E. Barker (8 h.p. Zenith) ; time, 33⅘s.

Private Miller (Blackburne sidecar) keeps his left hand on one of the sidecar joints.

SIDE LIGHTS.

The Army and the Stage.

Private Millar, who was riding a Blackburne, is brother of Miss Gertie Millar, the well-known actress.

A D.R. Competitor.

We were very glad to meet Frank Begby, the old Enfield rider, who, on Saturday, was mounted on a Zenith. He was invalided home from the Front (where he had been since the very beginning of the war) suffering from shock. At Cassel, some distance from the firing line, a 17in. shell exploded quite close to him as he was riding, blowing him right over a brick wall. It is hardly to be wondered at that this unpleasant experience resulted in an attack of neurasthenia.

The Douglas Prize Winner.

Lieut. Bassett, who is one of the leading lights of the Streatham and District M.C.C., went out to the Front as a D.R. in October, and landed at Ostend. He had an exciting time during the fighting in this part of Belgium, and later received a commission in the Royal West Kents.

Milner and his Levis.

Sergt. A. Milner is the back bone of the mechanical section of a well-known D.R. training centre. After winning the formula cup, he gave an exhibition of trick riding. Racing the engine, he would suddenly engage the low gear, with the result that the machine would rear like a horse. He told us that his present clutch was too fierce, otherwise the machine would rear and travel quite sixty yards with the front wheel in the air. The little engine is certainly a marvel for its size. We tried the Levis on a short run and found it a wonderfully efficient little mount.

Mechanical Details.

A look round the competing vehicles did not reveal a great deal of interest. However, we noticed a double terminal Lodge plug on C. P. Wood's A.J.S. One terminal was connected to the magneto, while the other was coupled up to an ordinary plug fixed into the exhaust valve cap.

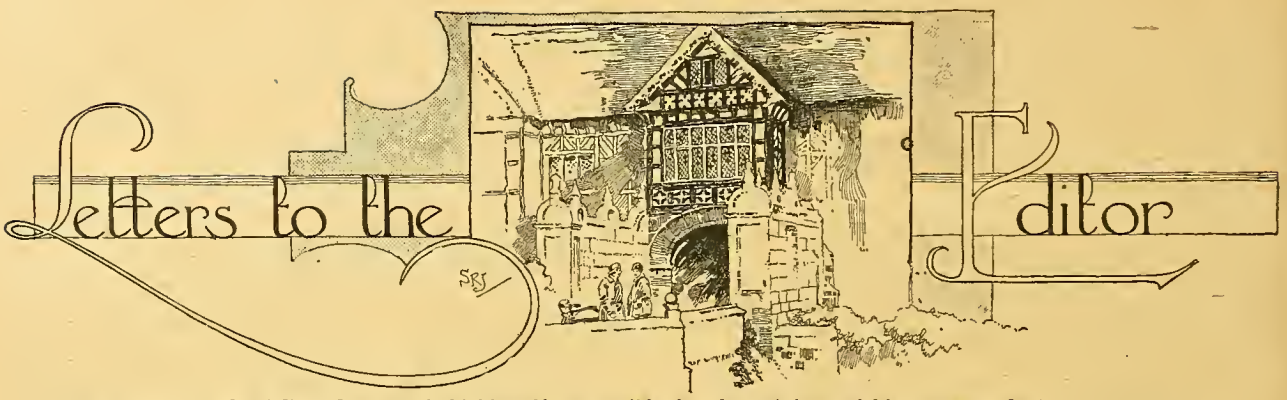
On the J.A.P. engine on Johnson's Morgan we noticed valve caps fitted with radiating fins arranged *en étoile*.

How we got There.

We reached the scene of the hill-climb on a twin-cylinder Pope. Though provided with a solo gear it ran well, and climbed all hills on the Portsmouth Road on top speed. From the sidecar seat it was interesting to watch the working of the back wheel springing device, which appeared to be doing its duty well.

A Good Story.

Mr. A. V. Ebblewhite, who with his colleague, Mr. F. T. Bidlake, was timekeeping at Newlands Hill, told us an excellent yarn. In the courtyard of a certain inn on the East Coast a young officer, who arrived on a twin, was telling his troubles to some friends, and proceeding to locate the source of mischief the while. "There! I told you so," he exclaimed, as he took out the back plug, "I knew it was the plug all the time. Fancy putting a four-point plug in a two-cylinder. Of course, it's only suitable for a four. What on earth is the good of four sparks on a two-cylinder? It is extraordinary the tricks these beastly garage people will play if you don't superintend the work yourself."



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Information Wanted from Dutch Motor Cyclists.

Sir,—In reference to the illustration in your issue of the 9th September of two Dutch cyclists who have fitted the Auto-wheel to a bicycle in the place of the back wheel, I would be glad to know how they have made the connections.

E. T. BOYD.

The Pen-y-ball Hill-climb.

Sir,—I notice in your excellent account of the Liverpool Motor Club's hill-climb at Pen-y-ball on the 18th inst. that you mention my 8 h.p. Matchless-Jap as mysteriously drying up, and I should like to offer an explanation, as it does not seem fair to the makers or myself.

After the hill-climb I looked over the machine carefully, and found some unsportsmanlike person had tampered with my Amac carburetter, putting several thicknesses of paper between the float and split pin on valve stem, consequently reducing petrol supply and starving engine. It is quite evident this was done by someone with a good experience of motor cycles. Surely this practice would put the damper on many wishing to enter for competitions.

H. I. HUGHES.

A Competition for Munition Workers.

Sir,—It is with pleasure I notice in the last issue of *The Motor Cycle* that you advocate a competition for munition workers; this I presume to be in the nature of a hill-climb.

Your suggestion that an event should take place in the Midlands is decidedly appropriate, having in view the great number of motor cyclists engaged on Government work in the district. With a view to arranging an open hill-climb on the lines suggested by you, I purpose bringing this matter up at the next committee meeting of the Wolverhampton M.C.C., to be held 27th September, and will lose no time in acquainting you of the decision arrived at.

In the event of this competition taking place, I would suggest that the nett profits be allocated to an approved war charity fund to be named by yourselves or decided in committee. You are doubtless aware that the Wolverhampton M.C.C. handed £25 over to the Red Cross funds as the result of their recent hill-climb held at Style Cop.

A. H. MEE,
Vice-president, Wolverhampton M.C.C.

[Any decision arrived at by the Wolverhampton M.C.C. will be found in the centre pages of this issue.—Ed.]

Sir,—I have just read "E.T.E.'s" letter regarding a competition for munition workers, and I think the idea is an excellent one. The munition worker's life is a hard one, and he lacks the excitement and variety which the men in the Navy and Army experience. A Saturday afternoon competition would relieve the dull monotony of life in the "shops." I would suggest that some competition should be arranged within an easy distance of Tyneside, where a large number of munition workers are to be found, who are also keen motor cyclists.

T.A.C.

[Other motor cyclists engaged on munition work have expressed to us their willingness to support a competition.—Ed.]

Sir,—I have no doubt my committee would be pleased to consider the promotion of an open competition this autumn on the lines suggested by your contributor "E.T.E.," that is, that all competitors be on war service. But before doing so it would be necessary for me to receive some indication of the support such a competition would be likely to receive, and I would, therefore, ask all those munition workers and naval and military motor cyclists who are prepared to enter to write to me.

The competition might advantageously take the form of a reliability trial in the Midlands, for all classes of machines, with entry fees as low as is possible under the circumstances.

T. W. LOUGHBOROUGH, Secretary, Auto Cycle Union.

Mind and Machine.

Sir,—Mr. Vulliamy has omitted to point out that the transfusion of psychic force implied in the motion of an engine is transmitted through dynamic affinity to the inherent and essential sub-consciousness of the sensory attributes. Consequently the automatic influence of this transfusion reacts at once on the sensitive nervous system of the human being, and is conveyed to the cerebellum by capillary attraction, being partly reciprocal and partly suggestive.

This is liable to cause pitting of the exhaust valve.

E.P.B.

A Two-stroke in Australia.

Sir,—I see a lot of letters in your valuable paper, *The Motor Cycle*, of riders giving their experiences, so I thought mine might be interesting to some of your readers, and here are just a few. I am the proud possessor of a Connaught two-stroke which is ideal for these roads out here. I purchased it a little over a month ago, and to date I have covered nearly 700 miles without any mishaps except a sooted sparking plug and a choked jet. I have not had it to pieces yet, so I cannot say how the inside of the engine has fared, but I have always lubricated it with half as much again as the directions say, as I think it is easier to decarbonise than rebush the bearings. The machine is running and pulling better now than when it was new, and the compression is just perfect. I always average a good 120 m.p.g. without any special settings of the carburetter; it is just the same now as it was delivered to me, with a 24 jet.

I went for a short spin a few days ago for about thirty miles. It included one of the worst roads about here, as it runs around the foot of a line of hills, and the water runs across the road every yard or so in gutters about three or four inches deep. I think this sort of road tests the machine more than all the mudplugging we ever get. We in this particular district very rarely do any mudplugging, as the mud sticks like glue when it is wet so that it is impossible to get along at all. The roads are terribly twisty, and we think ourselves "going some" if we can attain to a maximum of 20 to 25 m.p.h., and it is a bit risky at that pace because it would only take a moment and we might be in trouble.

Since the war we are having trouble in obtaining new machines and spare parts. The spare part business is always a bit of a mystery to the outside buyer, as he cannot get what he wants except at an outrageous price. I might add the usual disclaimer.

G.W.A.

Gilgandra, New South Wales

A Lancashire Road Puzzle.

Sir,—I am much indebted to you for your letter of the 20th inst., in which you were good enough to draw attention to an article entitled "A Lancashire Road Puzzle" in *The Motor Cycle* of September 16th. We certainly will, as soon as possible, have a special inspection made of both roads between Warrington and Preston and carry out whatever revisions may be found necessary in the signposting.

J. W. ORDE, Secretary R.A.C.

Motor Volunteers.

Sir,—The Southern Home Division of the National Motor Volunteers, although only two months old, consists of over forty car owners and at least six motor cycles. Every day our members are doing work for the War Office, for which they are paid Army rates. The movement is quite voluntary, and excellent work is being done every other Sunday in taking out wounded soldiers. Our uniform is khaki, and we are affiliated to the Central Association.

I should be pleased to send all particulars to those interested.

GEORGE F. DOLAND.

Praise for a Good Machine.

Sir,—You may remember that I won the magnificent cup which you presented to me for gaining the biggest number of wins at the United Services meeting at Brooklands on September 4th, and that I rode a 3½ h.p. A.B.C. machine.

Since then I have received many enquiries about the A.B.C. machine; so many, in fact, that I find it difficult to reply to them all. Allow me, therefore, to make use of your columns.

The machine was a standard touring machine, which I bought in the ordinary way from Traders and Co., of Pilgrim Street, Newcastle, the Northern agents. I had already ridden it 5,000 miles, and until a few days before the race had not thought of entering. I rode down from Newcastle to Brooklands, a distance of 300 miles, in ten hours, raced on Brooklands, returned in the same time, and all this without one single involuntary stop of any kind.

I have owned the machine six months, and during that time have had no engine trouble of any sort or description.

The machine, as I rode it on Brooklands, was in no sense a special mount, and was equipped with a spring frame and four-speed gear. Lastly, I have no interest in the A.B.C. firm. I only wish I had!

H. GRAHAM-HODGSON (Corpl. R.E.).

Eliminating Weaknesses in Motor Cycles.

Sir,—I notice a letter, signed by A. B. Wade and F. G. Ball on "Eliminating Weaknesses."

In the use of any new arm, time is certainly required to ascertain the most useful men to put in charge. Now, however, we have had over twelve months' practical experience, and still the appointment of officers is in a somewhat inchoate condition. We find both at home and at the Front bodies of motor cyclists are in charge of officers and senior non-commissioned officers whose technical knowledge is, to say the least, deficient, while skilled men, trial managers of great works, competition riders (of the practical not spectacular variety), etc., are either full privates, lance-corporals, or at most mechanic sergeants.

Moreover, one large firm, to my certain knowledge, volunteered to send a member of the firm to the base in France to superintend large repairs and replacements, but the offer was declined with thanks. How a commission composed of theorists with political or social claims would benefit matters I, for one, fail to understand. In the other areas of the Services the men who know are appointed to superintend and organise. Why is this not the case in the motor service?

As a civilian who has been practically interested in the development of motor transport over difficult and dangerous surfaces for eleven years, I have been waiting to see various officers (who, to my knowledge, are experts in these matters) promoted to responsible positions; meanwhile the experts of the trade—whose firms miss their services daily more and more—are still employed in the routine work of despatch riding and handling a few transport waggons, work on which their attainments are absolutely wasted. Would it not be possible for a paper such as yours, and the other motor publications issued by your firm, to represent to the military authorities that now the military qualifications have been judged by practical experience a judicious selection for promotion of technically trained men should be made, and the whole supervision of motor cycles be placed under a general officer whose technical knowledge of the arm with which he has to work is beyond cavil.

At the present time the abuse of motor cycles by officers whose knowledge is confined to being able to ride as long as everything goes right would not be tolerated for one moment in the cavalry or artillery. To look after the animals used in the Army a special department was created—the Army Veterinary Service—where technical knowledge is the only passport.

Can you not bring about the instant formation of an Army Motor Department, where entrance can only be obtained by knowledge, and where high command can only be held by the man who knows more about his subject than any of his subordinates?

Had we such a department the crying scandals of the motor service would sink into insignificance, while the gross abuses (such as the use of thin water-cooled oil for high-speed, air-cooled engines travelling long distances on the low speed) would be remedied.

My thirty-five years' experience of cycles and twelve years of motor cycles must be my only excuse in addressing this letter to you, also the fact may be noted that during all these years I have had no financial interest in the industry. Further, I have no personal knowledge as to who are the officers at the head of the various motor organisations, but am only judging by the results obtained as I see them on the road, at the works, or as I hear from various persons who are or have been on service with motor cycles.

CHARLES S. PATTERSON, M.B.Univ.Edin., M.R.C.S.Eng.; Judge Spring Trials A.C.U., 1913 and 1914.

Overheating v. Red Hot.

Sir,—Seeing is believing, so when you see snakes you naturally suppose they are there. I do not think any man ever mistook a red hot engine for anything else. Of course, there is the possibility of a sailor taking it for a port light on the starboard side, or why not make red hot engines a standard fitment? They would do all right for rear lights. Just think of the time saved, to say nothing about the money and language. However, so much for piffle.

Many years ago I owned a 3½ h.p. Rex with coil ignition and m.o.v. engine, date uncertain, about 1907, powerful, fast, and a good climber. This I cannot say about some of the later models of various makes I have had. This engine would run at an ordinary temperature when used as a solo mount; but, as I carried my friend behind for many miles through hilly country, this engine got very warm, and if the journey continued it got "red hot"—cylinder head, exhaust valve cup, exhaust port, and about 8in. of the exhaust pipe. It ran more silkily, less noisily, and without any loss of power whatever. I used the machine for fifteen months, and this was a common occurrence. The man I sold it to used it for ten months, when he had the frame broken. It has since been repaired, and is still running—the same engine and the same rusty cylinder. The present owner has tried all the makes of cylinder black, just as I did four years ago, without success.

GEO. F. CAMPBELL.

Two-stroke Engines and New Pistons.

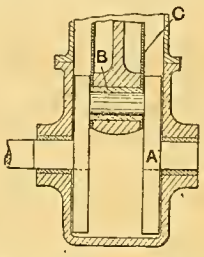
Sir,—I have noticed in *The Motor Cycle* several questions as to two-stroke engines after new pistons have been fitted. Well, exactly the same thing has happened to my engine as to others. Having fitted a new piston it has lost quite half of its power and konks out on hills badly. The compression is perfect, the timing is all right, and have tried advancing it; also the carburetter is right, and have tried altering the float and a smaller jet, but with no better results. The rings and piston are a good fit. I might say it four-strokes more than it used to do. You say 200 miles should run a new piston in. Well, mine has done over a hundred, and it has made very little difference, if any. I have had four mechanics on it, but it has stumped all of them. I should be much obliged if you could suggest anything.

T.M.B.N.

[The symptoms point to the piston being too tight a fit.—Ed.]

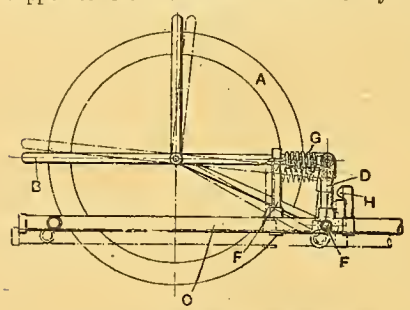
Two-stroke Engine Improvement.

In order to obtain a high ratio of compression in the crank case, the connecting rod is adapted to act as a pump. The crank A is of the disc type, and the connecting rod end B occupies the whole width between the discs. Attached to the big end is a strip of leather C, which serves to fill up the space between the crank discs. On rotation of the crankshaft, the big end and leather strip sweep the charge in the crank case before them, thus acting as a pump, and supplying the fresh charge to the transfer port at a high pressure.—A. M. Low, No. 19,605, 1914.



Sidecar Spring Wheel.

The axle is mounted in a frame B, supported from the main frame C by a

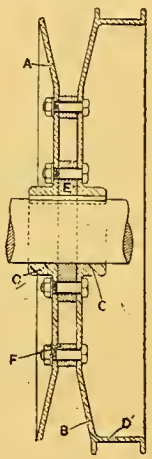


PATENTS by Eric W. Walford

lever D. This lever has a pivotal connection E to the frame. At F is a rigid pillar carrying one end of a spring G, the other end of which is attached to the pivoted wheel-carrying member D. The wheel A is therefore resiliently carried upon the frame. A buffer block H is arranged to check excessive movement.—T. H. Tessier, No. 301, 1915.

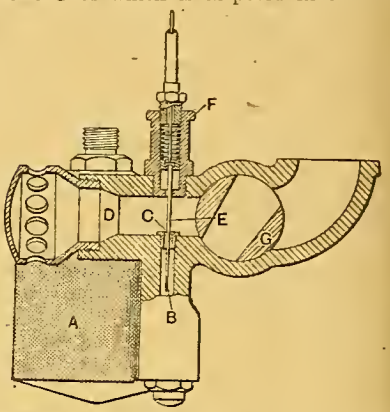
A Cycle Car Belt Pulley.

The pulley illustrated, which is the invention of Dr. A. M. Low, comprises flanges A and B, of simple shape, produced by casting, stamping, or forging. Each flange is formed with a boss portion C, whilst the flange B is shown extended at D to form a brake drum. The flanges are bolted together with intervening distance pieces E and F, and are secured upon their shaft by a key in the usual way.—No. 19,611, 1914.



Variable Jet Carburetter.

Simplicity is the keynote of the construction illustrated, the float chamber A supplying petrol to a passage B, the outlet C of which is disposed in the air



passage D through the carburetter. The outlet C is adjustable by means of a needle E of tapering section, and this is controlled by Bowden mechanism F connected up to any convenient point. At G is located the throttle barrel, which is rotatable either totally to cut off the passage through the carburetter, or to open it up progressively to the full bore of the passage C. The bore of the passage C in the illustration is rather small in comparison with the outlet orifice of the carburetter, which would result in the air passing the fuel outlet at a high velocity, even at low engine speeds.—C. Brown and Brown and Barlow, Ltd., No. 18,818, 1914.

American Excelsiors in Ireland.

Distribution of the American Excelsior motor cycles in Ireland is now in the hands of Thompson's Motor Car Co., of 19-20, Great Brunswick Street, Dublin.

Additional Works for making Avon Tyres.

Last week the Avon India Rubber Co., Ltd., who have big works at Melksham, entered into possession of the rubber works at Bradford-on-Avon formerly occupied by the Sirdar Rubber Co. The Avon Co.'s purchase comprises the freehold of the site, the buildings (known as Greenland Mills), and the manufacturing plant for the production of tyres, tubes, etc.

Pratt's Successes at Brooklands.

Eleven events figured in the last United Service motor cycle race meeting programme at Brooklands, all of which were won on Pratt's motor spirit. In fact, out of a possible thirty-two positions, riders on Pratt's spirit secured twenty-six places: ten securing second positions and six being placed third.

British Lamps at the San Francisco Exhibition.

Messrs. Worsnop and Co., the well-known lamp manufacturers, have been awarded a gold medal for their lamps and Alklum accumulators at the San Francisco Exposition. It is understood that this is the only firm in this particular line of business which has attained similar honours.

SPARKLETS

Zilla Belts.

A descriptive leaflet has been issued by the Zilla Patent Belt Co., Ltd., of 101, Great Western Street, Manchester. The Zilla belt; it may be remembered, contains, as its chief feature, a steel chain core and the leaflet explains the principle and advantages of such a construction.

A Motor Cycle Accessory Maker helps the Wounded.

Mr. C. W. Willmott, of Wilmott Bros., the well-known manufacturers of silencer extension pipes, whose works are situated in Norwich, is among those performing useful work in organising outings for wounded soldiers from the Norfolk War Hospital at Thorpe, near the above-named city. The country round Norwich is exceedingly pretty, and a particularly attractive route was chosen on the occasion of a recent outing. The party was entertained to tea by Mrs. Astley, of Plumstead Hall, and after tea a fishing competition was held, each competitor having two minutes, and numbers of fish were caught.

Belt Service in Australian Racing.

For two years running the Australian Grand Prix motor cycle race has been won on a machine using the Pedley belt. This year it was won by J. E. Mellor on a Matchless.

Owner Wanted for Sidecar Outfit.

Messrs. Brown Bros., of Great Eastern Street, E.C., inform us that they have had left with them by two members of the R.F.A., whose names and addresses they do not know, a motor cycle and sidecar. They will be glad to obtain the necessary information.

The Manufacture of Artificial Rubber.

In the course of a lecture to the Society of Arts on "cracked" spirits and other means of increasing fuel supplies for motors, Professor Vivian B. Lewes, F.I.C., F.C.S., made a startling statement concerning the production of rubber by synthetic processes. After detailing the results of a series of experiments he said: "There is very little doubt that some isoprone is formed, and as this is an excellent starting point for the synthesis of artificial rubber, we may some day see the cracking of oils providing tyres as well as fuel to the motor car." The speculation is a bold one, but chemistry is one perpetual marvel. Still, shareholders in rubber companies need not worry, and there is not the least likelihood that the construction of the new Dunlop factory at Birmingham will be in any way arrested by the threat of rubber becoming a by-product of petrol.

"I do not think it would be possible to obtain a more really satisfactory combination for real hard road work or serious touring than the Zenith-Millford of the kind in my possession. In 8,000 miles it has given practically no trouble whatever and is running as well to-day as when it was new."

C.S.L. in "The Motor Cycle and Cycle Trader," *Sept. 17th*, 1915.

The above extract summarises the writer's experience of an 8 h.p.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade Labour Exchange, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

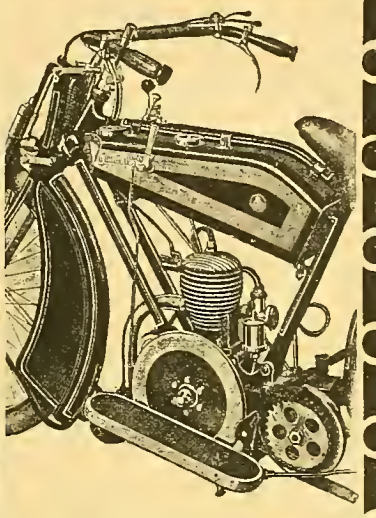
The "IVY" TWO STROKE



Above illustration shows our new pattern frame that will from now be fitted to our "De Luxe" Model Two-Stroke machines only. It is our registered design No. 531848, and the principle is as follows:—Instead of the usual round down tube coming from the ball head, we bring two oval blades from a specially designed ball head down on each side of the exhaust pipe to the crank case. Each of these blades is double the strength of the ordinary round down tube, and is made of a specially toughened steel which will stand being twisted a number of times without breaking. This frame is no heavier than the ordinary diamond frame, and is

ABSOLUTELY UNBREAKABLE.

Other exclusive features of our "De Luxe" model are—

Special shaped tank, holding 1¾ galls. petrol, ¼-gall. oil; comfortable footboards; machine enamelled khaki-grey; marvellously efficient engine, etc.

It is no wonder the machine is called

THE ARISTOCRAT OF ITS TYPE

Stanley Webb, Manager,
BROMLEY, KENT

14, North Street, Bishop's Stortford,
Herts. April 15th, 1914

Dear Sirs,

On Feb. 5th last you were good enough to send me a non-return release valve for crank case for my motor cycle on which I had fitted an "Enots Drip Feed. I should like to express m appreciation of the working of the "Enots.' It has made an enormous increase in the power, ensuring at the same time correct lubrication.

I remain, Yours truly,
S. A. Milbank.

The Budget and Desirable Exemptions.

AT one period of the debate in Parliament last week on the import duties on cars, motor cycles, and accessories, there were indications that the tariff would be removed altogether. As it was, the Chancellor agreed to exempt motor vehicles, chassis, and parts used exclusively for trade purposes—though he did not give a definition—and further intimated that motor tyres should be exempt. The resolution increasing the duty on motor spirit by 3d. per gallon was agreed to. In passing, there was one point in the debate which should not escape the observant. The Chancellor remarked that "the only ground he could see for any opposition to the duties from the point of view of the fiscal controversy was the idea that they would lead to something more in the future. But duties of this kind *could not be continued after the war.*"

There is also another point: It is by no means certain that motor cycles used entirely for business purposes will escape the import duty—rather the reverse, unless our organisations controlling motor cycling lay a strong case before the Chancellor. After all, the growing use of the business motor cycle sidecarrier is directly attributable to the war, *e.g.*, to the wholesale commandeering of tradesmen's horses at the outbreak of hostilities. True the numbers concerned may not in any way compare with business cars and lorries which the Chancellor unquestionably had in mind, but, as the definition has not yet been framed, we sincerely hope that the claims of the smaller tradesmen using sidecarriers will not be overlooked. *The Motor Cycle* is doing its share in drawing the attention of the authorities to these matters, and it is to be hoped that the request may be viewed in a favourable light. Should no concessions be granted in respect of business sidecarriers, there is a fear that the future success of this type of vehicle will be jeopardised, as tradesmen may decide that a four-wheeler costing little more and capable of transporting heavier and more bulky packages is the more preferable of the two. Exemption from import duty would mitigate that possibility to some extent and help tradesmen to economise.

America turns to Lightweights.

SOME months ago we commented upon the fact that our American cousins were a long time giving attention to the lightweight motor bicycle movement, which has attained such a hold in this country. It would appear that our remarks were not altogether ill-timed, for at last month's Chicago Show several specimens of American lightweight motor cycles made their *début*.

Hitherto England alone of all countries manufacturing motor cycles—except Switzerland—has maintained faith in the future of the lightweight motor cycle, and though the lightweight of but six years ago could not compare with a modern mount, it was plain to those who made an intelligent study of the question that in the lightweight we had the motor cycle of the future. Six years have wrought many changes in motor cycle designs, and the developments in connection therewith have been enormous. Firstly, the standardisation of variable speed gears made the really successful lightweight possible, and, latterly, the advent of the two-stroke engine gave the movement an enormous fillip. These developments and improvements in lightweights have been almost entirely confined to this country, and consequently it is some source of gratification to note that manufacturers across the Atlantic, in a land where the opposite type, *i.e.*, the big twin, has always loomed large in the public purview, have at last had to sit up and take notice. The American seal of success has thus been placed upon our home manufacturers' efforts, and it may be taken for granted that the Yankee will make what good use he can of the spade work of the British manufacturer who has made the efficient and successful lightweight solo mount possible.

An index to the advertisements in this issue will be found on the page facing the back cover.

Ladies and the Motor Cycle

Sidecar Passengers.

WE often hear, or perhaps it would be more correct to say have heard in the past, criticisms of the lady driver, but, personally, I imagine a few words to the passenger would not be untimely. How greatly the driver appreciates a sporting passenger, one who willingly takes her share of the responsibilities in any way that is open to her, assumes a little intelligent interest in the unit that drives the outfit, one who doesn't mind helping with a puncture, and isn't horrified if her hands become grimy! We are all more or less familiar with the passenger who fancies she is out for a ride only and is quite helpless and looks injured if called upon to lend a hand. The ideal sidecarist is one who is capable of occasionally making a running start, when the road is on the decline, and whose ear tells her when to step into the sidecar before the exhaust is dropped. However, by the time the passenger has become trained to this extent, she generally decides that she will invest in a machine of her own so that she may do all the driving.

Carrier Riding.

Many are the casualties due to pillion riding reported in the newspapers, but, in spite of the proved folly, the practice seems to be as popular as ever. I have noticed girls who have grown accustomed to this dangerous method of riding appearing perfectly at home with feet dangling and no clutching the driver with their hands, a kind of "familiarity breeding contempt." A few days ago a typical "specimen" passed me doing well over thirty. Some horses emerging from a side road caused the driver to pull up hurriedly. As the brakes were applied the machine developed a wobble, which the driver only just managed to correct. All this time the fair flapper perched on his carrier balanced herself with ease, gazing round at me with a simple smile. Would her expression have been so normal had she not been so blissfully unconscious of the danger of her position?

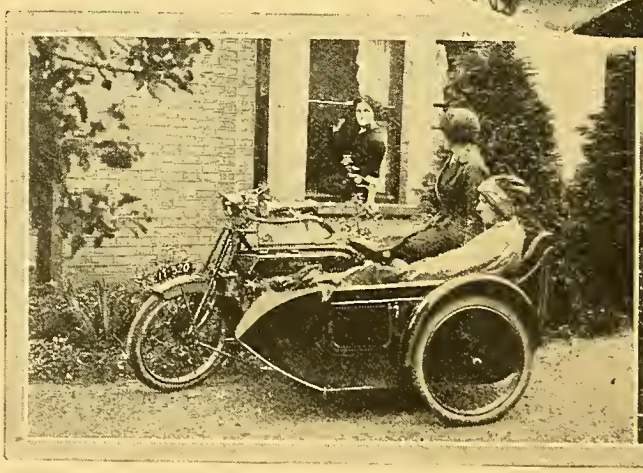
The Rear Light.

I was reading in the motor cycle press that copper tubing was the best thing to carry gas from the head light generator to the rear lamp and so save the tiny back generator. To go one better than this, as being more pliable and neat in appearance, use Bowden cable; this one can easily fit one's self. All that is needed is a few clips to keep the cable in place along the top tube. It is a saving of trouble to have the one generator supplying both front and rear lights.

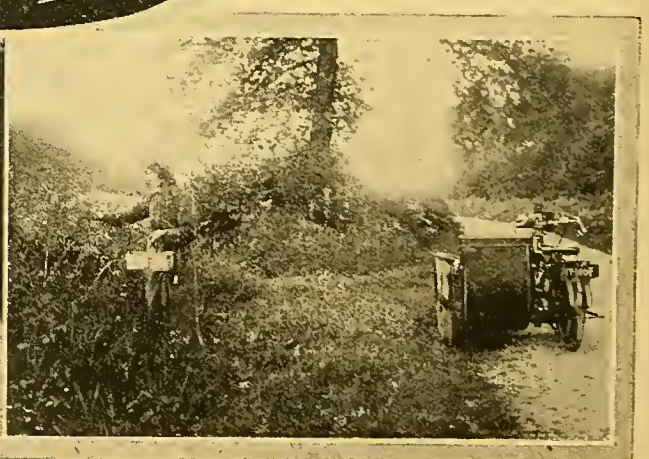
During the present time any woman anxious to find an occupation and having at present no outlet for her energies would probably release a man for the Forces and show her patriotism by taking a post as a driver of a trade car, if she only realised how simplified driving has become, and how rarely one gets into difficulties that are insuperable.

MAY WALKER.

A run to a friend's orchard.



The topic: Is it motor cycles or the abandoned import duties on hats, or both?



Blackberrying with a sidecar outfit

Four-stroking when Starting.

A Junior Triumph owner takes exception to my remark that some "babies" are apt to four-stroke for a few yards when starting off. I ought certainly to have excepted the "petroil" machines from this indictment. The main causes of four-stroking are rich mixture and over-oiling. If a drip-oiled machine is left standing for some time, the oil drains out of the bearings until an excessive amount has collected in the crank case, and consequently four-stroking may occur until the surplus is exhausted; a condition which is seldom present with the petroil system. I have tested this suggestion by draining the crank case of a drip-oiled pattern prior to a cold start; after this attention was paid to it, it ceased to four-stroke when starting.

Man and Machine.

I think we should recognise that perfect locomotion is only possible when a rider and his mount have established a kind of centaur-like sympathy; but, at the same time, we should distinguish between the sympathy which a rider can establish between himself and a sentient mount (*e.g.*, a horse) and between himself and a mechanical mount (*e.g.*, a motor car or cycle). The horse responds by comprehending its master's wishes and riding tricks; in other words, the sympathy is mutual where the mount is sentient. With a mechanical mount the word "sympathy" is hardly accurate, and the idea of "control" is more accurate. A really deft manipulator can get the most uncanny results out of a non-sentient instrument. Just as first class golf or billiard or cricket players can, in common parlance, almost make a mashie or a cue or a ball "talk," so a crack motor cyclist can perform miracles with his machine. But the process is entirely one-sided. It is, surely, all a matter of muscular dexterity and intellectual comprehension of possibilities on the part of the controller. I quite expect to be told by somebody that an Indian, a Triumph, and a Levis each has a different "aura," and that "aura" can be seen by the psychic expert, or even photographed with a suitable screen; but I shall remain frankly sceptical. The alleged relationship is a matter of personal dexterity.

Four-stroke Lightweights.

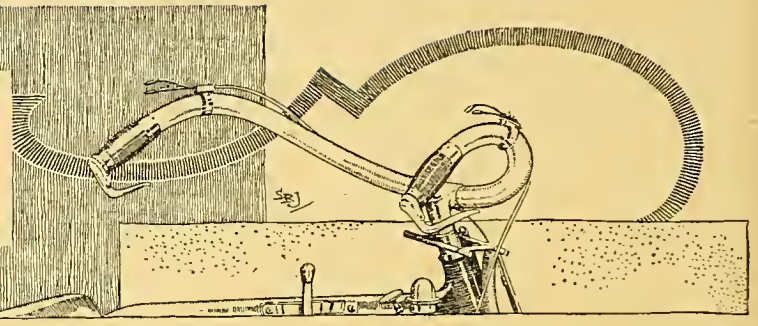
I was profoundly interested in "Road Rider's" description of the 23¼ lb. engine which he saw at the A.B.C. works. Readers may remember that this Lilliputian power unit was a horizontally-opposed twin-cylinder of 250 c.c. capacity, with steel cylinders and steel pistons, and mechanical lubrication, developing over 4 b.h.p. It has been developed purely in response to a demand for a small engine to act as starter to the huge engines of 200 h.p. and over, employed in so many branches of war service; but it is perfectly obvious that it is admirably adapted for fitting to a lightweight motor cycle. In fact, it might open the door for wee four-strokes to become very formidable rivals of the two-stroke in this sphere. The average baby two-stroke still scales nearer 150 lb. than 100 lb., and some of them exceed that figure; they are of the low efficiency type, and they are more prone to engine vibration than the little twin in question. There is no question but that the novelty of the two-stroke has temporarily arrested the development of miniature four-strokes, in which field there has been nothing to compete with the single-cylinder, and the average 200-250 c.c. four-stroke single has never had as much thought and labour lavished upon it as its bigger sisters have enjoyed. A new prospect is opened, viz., that after the war we may see the development of a new type of machine, roughly resembling a Douglas, but on cheaper and lighter lines. These machines will be of comparatively high efficiency, as contrasted with existing two-stroke types, and may eventually blossom into the genuine 100 lb. fast touring machines of which imaginative prophets have often dreamed.

Foot Ease.

I fancy this cross-heading is the registered slogan of a leading firm of boot manufacturers, and trust they will be lenient with me for borrowing it. The discomfort of cycle pedals when used as footrests is that, though they provide a varying range of sole-angles, they do not afford a sufficiently rigid support for the feet, and they are generally set so far back that the rider permanently assumes the posture of a man who is trying to decide whether an object in the road is a halfpenny or a washer. Both my present machines are fitted with footboards, and I find them uncomfortable; in one case one end of the boards is sprung; in the other both ends are rigid. They afford a varying range of leg angles, and a practically rigid foot support. I ascribe their discomfort to the fact that they offer no change of sole angle, and that there is nothing for the instep to catch on, so that the feet slide about on the boards. I have yet to discover anything so comfortable as a couple of pairs of rigid, unsprung footrests, which give a hold for the instep, a change of posture for the thighs, a rigid something to push against, and a change of sole-angle. Why machines *de luxe* nearly always have these most unluxurious boards is one of those things which no one can understand. I once had a machine—a Bat—with a pair of sprung rests and a pair of rigid rests; and as the sprung rests were interconnected with the sprung saddle pin, this combination is perhaps the best of all; but I did not get the full benefit of it till I added the extra pair of rigid rests, which did not figure in the Bat specification, but struck me as essential, in that occasional changes of position are most desirable. In the meantime I do not want any more footboards, though a pair of loose heel plates, to be screwed into the boards after purchase at the rider's discretion, would improve this system enormously.

Transmission Shock Absorbers.

A REVIEW OF CURRENT PRACTICE.



IT has been observed, and those who have ridden machines of early pattern will not dispute the statement, that the single-cylinder petrol engine imparts its power in a series of short, sharp jerks. This irregular motion is not, of course, so great in the properly balanced engines of to-day as it was in the engines of ten years ago, but, nevertheless, it is sufficiently pronounced at low speeds to upset the comfort of the rider unless the transmission be elastic enough to absorb the shock of the explosion strokes.

Not very many years ago it was quite generally believed that chain drives were unsuitable for motor cycle transmission, for the reason that a steel chain could not transmit the engine power to the back wheel without transmitting with it each individual impulse of the engine, which meant, of course, that the machine, instead of gliding forward as though driven by an electric motor, progressed in a series of bounds, each bound taking life out of the tyre, chains, and engine. It became obvious, therefore, that if the chain drive were to come to anything the power must be conveyed through some device that would absorb the sudden kick of the power stroke, and impart a smooth, steady torque to the rear wheel.

The efficiency of the various devices that have since been produced is amply proved by the sweet running of the present day chain-driven single, for every touring machine of this type is fitted with a transmission shock absorber of some kind. On this device largely depends the comfort of the rider, the machine's powers of acceleration and hill-climbing, the life of tyres, chains, and engine. Considering, then, that the transmission shock absorber is of such vital importance that it has brought about the complete success of the chain-driven "big single," it is somewhat surprising that many riders are not even aware that such a device is incorporated in the driving mechanism of their machines.

Various Devices Used.

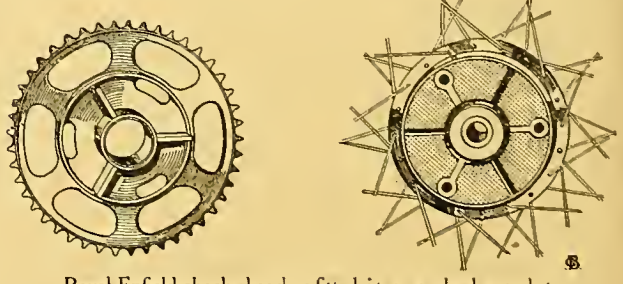
It is interesting to note the different lines on which manufacturers have worked with regard to transmission shock absorbers. The two most popular devices in use are probably the friction type, which permits a certain amount of slip to take place when sudden strains are thrown upon the chains, and the "cushion drive," which damps the impulse of the engine by means of yielding pads contained in one of the sprockets. The former is generally used in connection with single-cylinder machines, and the latter in connection with twins. In the case of the chain-cum-belt drive, the belt is sufficiently elastic to answer the purpose, and one or two machines depend solely on the clutch.

The transmission shock absorber has not reached its present stage of simplicity without experiment. Many elaborate schemes have failed in practice through their possessing the desired property of elasticity to too great an extent. Such devices were found to absorb the engine and road shock admirably, but, owing to their recoil, the machine now progressed in a series of elastic bounds, even less pleasant for the rider than the solitary snatch of the solid drive. Then in the case of the friction device difficulty was experienced in obtaining a construction which would keep its very fine adjustment with any degree of permanency, since the friction surfaces and locking arrangements were bound to become smothered in oil at intervals; in each case, therefore, it was necessary to compromise, to strike a delicate medium, and the present-day shock absorber, which seldom or never requires attention, called for more thought from the designer than we are apt to suppose.

Since the thrust really comes from the road, and not from the engine at all, the shock absorber should theoretically, be contained in the rear wheel hub, but in practice it is usually placed on the engine sprocket. Most manufacturers are agreed, however, that a device of large dimensions, contained either in the rear wheel sprocket or in the countershaft sprocket, is the right idea.

The Royal Enfield Cush-drive Hub.

The Royal Enfield device may be taken as an example of the cushion drive type of shock absorber. This is a device of large dimensions, contained in the rear



Royal Enfield shock absorber fitted in rear wheel sprocket.

sprocket. For convenience this sprocket may be described as consisting of two portions, the driving member, which carries the chain, and the driven member, which is solid with the road wheel.

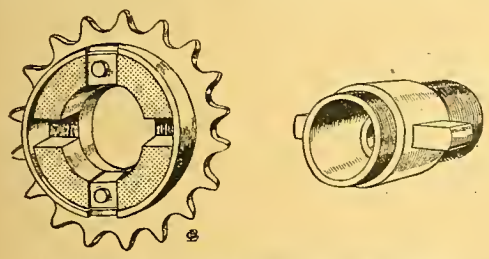
Transmission Shock Absorbers.—

The driving member, carrying the chain, is a circular flange, from the inner face of which protrude three metal vanes, set radially; and the driven member consists of a drum, of the same size, the interior of which is divided into three chambers by corresponding metal vanes. Each chamber contains two rubber pads, between which the vanes of the driving member fit when the two parts are engaged.

It will be seen, therefore, that the drive is transmitted from the vanes of the driving member, through the rubber pads, to the vanes of the driven member, and it can be readily realised that this complete insulation between the chains and the road wheel has a decidedly softening effect on the drive. With a well-balanced twin it is not so much a matter of absorbing "snag" from the engine as it is of smoothing out the little jerks transmitted from the road wheel. The Enfield machines are also provided with a friction sprocket on the engine-shaft, in which the two sprockets are carried between steel flanges capable of sliding but not of rotating upon the engine-shaft, and gripped by twelve small springs, as well as a slipping clutch.

Lea-Francis.

The Lea-Francis machines are fitted with a cushioning device. On the engine-shaft is mounted a boss, on either side of which is a rectangular protrusion or metal vane. The chain sprocket is loosely mounted on the boss, and through it extend two rivets, which carry square shoulder pieces. Thus the interior of the chain sprocket is divided into two compartments, and each compartment contains two rubber blocks, between



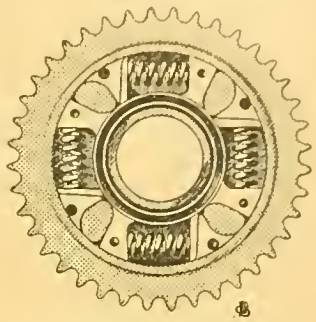
Transmission shock absorber fitted to engine-shaft of the Lea-Francis.

which fit the metal vanes on the boss of the engine-shaft. Whatever the motion of the engine, therefore, it is conveyed to the chains through the rubber blocks, while, similarly, any jar thrown on the chains by the road wheel is softened by the pads before reaching the engine bearings. The whole device is held firmly together by a large sized nut on the end of the boss.

With these small and perfectly balanced twin-cylinder machines, however, designed primarily for solo use, anything in the way of transmission shock absorbers may be regarded as a refinement rather than a necessity. Their function is not so much to absorb the impulse of the power stroke as to add to the life of the engine by softening down the drive.

Humber.

On the big twin-cylinder Humber machines the refinement is taken one step further, and here we find a luxurious machine fitted with a shock absorbing device which contains both rubber pads and steel springs. In most cases springs taking the direct load of the engine have proved unsatisfactory, since the constant tension and relaxation tend to destroy their temper; but the Humber device is sufficiently large to permit the use of springs of considerable strength. The mechanism is contained in the rear wheel sprocket, as in the case of the Enfield. In conjunction with the foregoing explanations, the accompanying illustration is self-explanatory. The beautiful workmanship embodied in this device, together also with ingenuity of design, goes to prove that the Humber Co., at any rate, do not under-estimate the importance of an effective transmission shock absorber.



Shock-absorbing device fitted to the rear wheel sprocket of Humber machines.

Sunbeam.

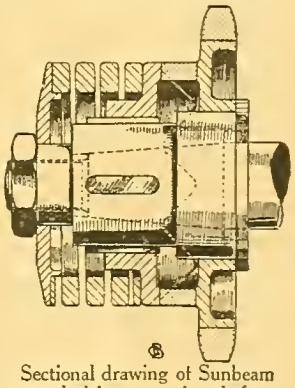
The Sunbeam machines are fitted with an original device worthy of a luxurious transmission system, and, though this arrangement has already been described in these pages, a brief outline as to its construction may not be out of place.

The Sunbeam device is neither a cushion shock absorber nor a friction drive, but to some extent it combines the merits of both. The sweet running of the 3½ h.p. Sunbeam machines is sufficient proof as to its working value.

The sprocket wheel runs loosely on a centre piece, which is keyed fast to the engine-shaft. On the side of the sprocket wheel is a series of angular projections. These projections engage with similar projections on the driving piece, which is free to slide endwise on the centre piece, but which is prevented from turning thereon by four keys.

The ratchets, or angular projections, on the two members are kept engaged by a strong coil spring, the tension of which can be adjusted by means of a nut on the end of the engine-shaft.

Since the sprocket is free on the shaft, and the member that engages it is keyed thereto, it will be seen that the tendency of the drive is to disengage the angular projections against the pressure of the spring, the keyed member sliding outwards on its four keyways, but never completely disengaging.



Sectional drawing of Sunbeam cush drive on engine shaft.

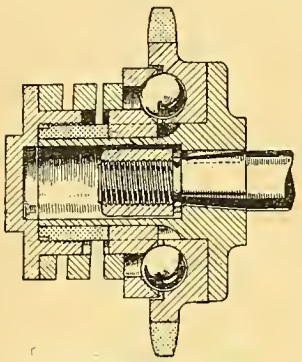
The device is set by the testers before the machine leaves the works, and if necessary seldom requires attention.

Rex.

The Rex device comes under the same category, but is very different in construction. The sprocket is

Transmission Shock Absorbers.—

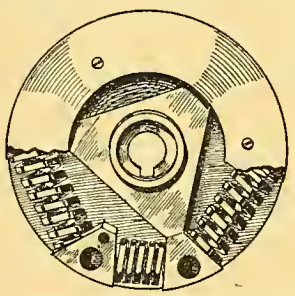
mounted on a boss keyed to the engine-shaft, and is free to revolve thereon. Next to the sprocket is mounted a sliding piece, from which the drive is conveyed to the sprocket by means of balls which fit half in the sprocket and half in the sliding piece. This piece, which is, of course, keyed to the boss, though free to move outwards, is held in position by a strong coil spring. When a shock takes place the balls ride outwards in one direction or the other, and in so doing they force the sliding piece outwards against the pressure of the spring.



Spring drive fitted to engine-shaft of Rex machines.

B.S.A.

The device used on the chain-driven model of the B.S.A. is attached to the engine-shaft. The sprocket contains six strong springs, through three of which any strain between the engine and the chains is passed. The springs are kept in position under all tensions by a retaining cap. It will be noticed that the springs are so arranged that the forward thrust of the engine is taken up by the three longer springs, the three shorter ones absorbing the lesser shocks which fall in the opposite direction.



B.S.A. spring drive fitted to engine-shaft of chain-driven models.

Friction Shock Absorbers.

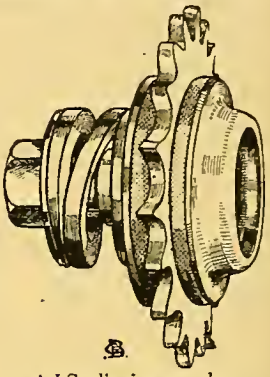
Coming now to the friction type of transmission shock absorbers, we find that these vary little in points of construction. As already stated, their object is to allow a certain amount of slip when any considerable shock falls upon the chains.

The slight slip that occurs at low speeds or with a heavy load eases the engine very considerably, and, when the device is properly set, the machine will ascend hills with ease which would cause it to labour were the adjustment too keen. It is only when slip is excessive that any loss of power occurs, and the proper adjustment is not difficult to obtain.

A.J.S.

The shock absorber used on the 2¾ h.p. A.J.S. machines is placed on the engine-shaft and consists of a steel boss carrying two fibre plates. Between these the sprocket is free to revolve, and pressure is maintained between them by means of springs, the tension of which can be adjusted as necessary.

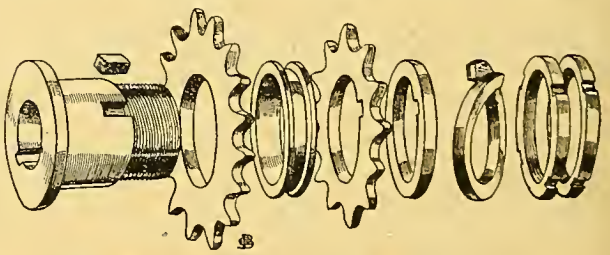
In the case of the twin-cylinder A.J.S. machines, which were sometimes ridden solo and sometimes with sidecar, it was found that the slipping device was not sufficiently necessary to warrant the trouble of setting it to the load when even a sidecar was attached, and, since 1912, these excellent machines have been fitted with solid transmission. The makers advise their riders to ease the clutch should any suggestion of snag be felt at low speeds.



A.J.S. slipping sprocket.

Phelon and Moore.

The Phelon and Moore device is very similar. It will be recalled that two sprockets are mounted on the engine-shaft. The low gear sprocket is keyed to the boss mounted on the engine-shaft, but the high gear sprocket is free to revolve thereon. The drive is maintained through a large spring washer placed between the high gear sprocket and the two lock nuts on the end of the boss, the high gear sprocket thus being firmly held between the washer and the low gear sprocket. By tightening up the lock nuts any amount of pressure can be brought to bear on the sides of this sprocket, which is thus prevented from revolving freely in the boss,



Component parts of P. and M. slipping sprocket.

while, by loosening the lock nuts, the tension of the spring washer is released till finally the sprocket would revolve quite freely.

In the case of the P. and M. machines a solid drive is permitted on low gear, for with the engine revolving at speed no suggestion of snag takes place.

Care and Adjustment of Shock Absorbers.

So far as practical use is concerned, the main points of difference between the friction types of shock absorbers and the other types here described lie in the fact that, while the former may require occasional adjustment and periodical lubrication, the latter are permanently fixed and need no attention whatever from the private owner. Cush drives, for instance, need not be interfered with, while devices on the lines of the Rex and the Sunbeam obtain sufficient lubricant from the engine bearing, and unless the drive is found to be harsh they are best left alone.

Friction shock absorbers, on the lines of the A.J.S. and P. and M., on the other hand, require a little attention if the transmission is to be kept in perfect order. They should be oiled periodically, and to obtain proper adjustment the machine should be jacked up on the stand and the lock nuts slackened off till, by gripping the tyre and jerking the engine against compression, slip begins to occur. Then give the lock nuts another quarter turn, and it will probably

Transmission Shock Absorbers.—

be found that no slip is perceptible when the engine is thrown over compression. This should give the proper adjustment, but a road test is usually desirable. If the adjustment is still too slack the engine will be felt to race at regular intervals on hills or when running on full throttle.

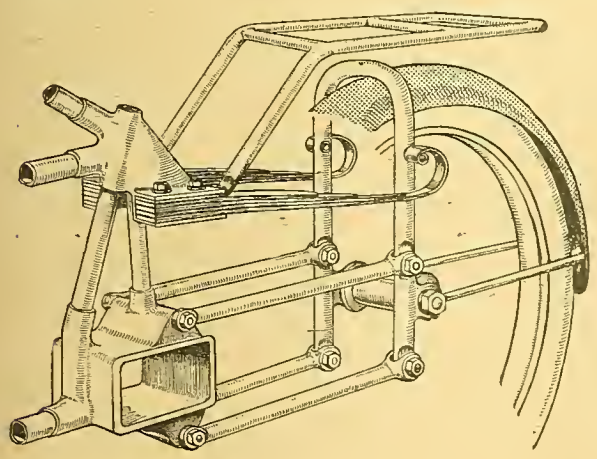
It is best to make this adjustment with the device thoroughly lubricated, otherwise an overdose of oil will cause it to slip.

Hard and fast rules cannot be laid down, and it is always the wisest plan to consult the makers if in doubt on any point concerning adjustment and lubrication. Do not, however, continue to ride your machine with the shock absorber wrongly adjusted. The engine and whole transmission system are bound to suffer. It is no uncommon thing to find machines fitted with adjustable shock absorbers being used with this device screwed up solid, while the owner comments upon the harshness of the chain drive! H.M.B

More Rear Springing Systems.

A Parallel Ruler Movement.

STILL another system of springing the rear portion of a motor cycle frame has been brought to our notice by Mr. E. F. de Burgh Greenwood, of 316, Chester Road, Lower Bebington, Cheshire. This system is illustrated in the accompanying drawing, and it will be seen that it works on the principle of a parallel rule, the two radius forks being so pivoted that the driving centre and driven centre are always nearly equidistant, thus avoiding binding of the transmission. Leaf springs are provided to govern the action of the vertical member, and these, together with the carrier, are anchored to brackets cast integral with the top lug and extended to a rear vertical member which carries the back wheel. Built into the countershaft of this machine is a machined casing, designed to accommodate the gear box. Integral with this casting are two housings for the bearings of the radius forks, and so arranged that one is above and the other below the driving centre in a vertical plane.



De Burgh Greenwood spring frame design.

The advantages claimed by the designer of this frame are:

(1.) Minimum unsprung weight.

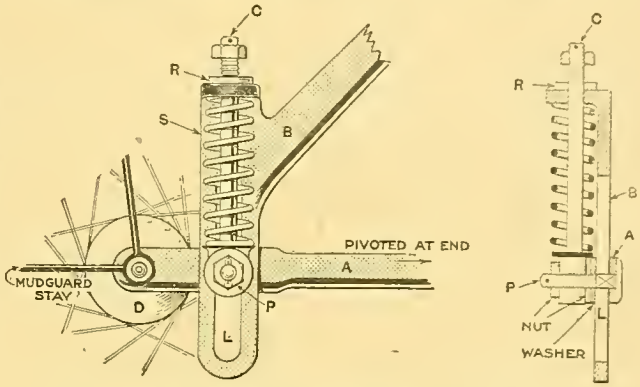
(2.) Even transmission running under ideal conditions, as oiltight chain cases may be fitted in a very simple manner.

(3.) Stability—preventing rolling.

(4.) Increased comfort for the driver, and decreased wear and tear of machine.

An Attempt at Simplicity.

A simple, though not very novel, method of rear springing has been sent to us by F.L. (Sheerness). The rear forks terminate in a specially formed lug containing a curved slot (this curve must be part



A. Chain stays carrying back wheel.
B. Rear forks, ending in specially shaped lug.
C. Bolt for recoil.
D. Back wheel hub.
L. Curved slot in which pin slides.
P. Sliding pin attached to A and carrying bolt C.
R. Rubber block to check rebound.
S. Spiral spring in compression.

of the circle of which the hinged chain stays form the radius, this stay being pivoted at the forward end). Through this slot passes a pin P which fits into a square in the chain stay A, flattened at this point for the purpose. A washer and nut are then placed over the pin and tightened sufficiently to allow of easy movement in the slot; the end of the bolt C is now put into position and secured with a nut and split pin. The chain stays carrying the pin and bolt are now free to rise and fall in the slot L against the pressure of the spring S, rubber blocks R being placed at the top of the lugs to check the rebound.

In the latest lighting order affecting the London district recently issued by the Home Office the sole paragraphs which are of interest to motorists are the following: The use of powerful lamps on motor and other vehicles is prohibited. (*a*) An hour after sunset all vehicles, including bicycles and handcarts, must display to the front a white light visible for a reasonable distance (if only one lamp is provided it must be placed on the off side); (*b*) to the rear a red light visible for a reasonable distance (if only one lamp is provided for this purpose it must be placed on the off side, and in such a position that the red light is visible from a central point immediately behind the vehicle).

THE 7 h.p. AMERICAN EXCELSIOR.

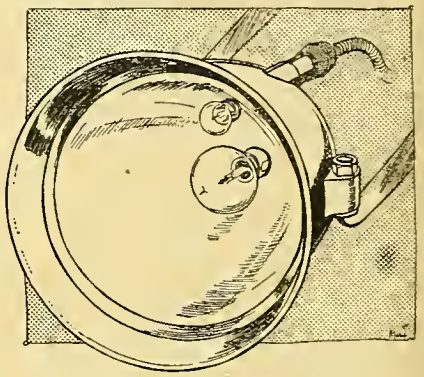
Three-speed Countershaft Gear. Double-controlled Clutch. Two Rear Brakes. Impressions after a Road Test of the Latest Model.

A YEAR or two ago English people were accustomed, and with a good deal of justifiable pride, to consider that the few makes of American motor cycles were a good deal behind the British in point of design and construction, and, with a few exceptions, that the Yankee machine was not worth serious consideration. A little later devotees to English machines began to notice that the American two-wheelers were being built on more scientific lines, the engines were more like English power units, frames were more logical, saddles more comfortable; in short, the Yankees were complimenting us by the adoption of our own ideas and inventions. Now the war has brought about the almost complete collapse of trade in freshly-designed motor cycles, and, more important still, of the total cessation of that all-important co-operation between the manufacturer and the man who brings out the latest ideas. The makers of the latest Excelsior are pronouncedly pro-English in designing their new model, for in quite few details does it show anything of the Yankee touch, excepting perhaps the twist-grip handle-bar controls, and it is evident from the closest inspection that the machine has been built with an idea to durability and good service, instead of the flash "one-year 'bus" that so often hails from the American factories. Hence the writer's conviction that this new type of American machine will sooner or later make a great impression upon private buyers in this country.

Comfort and Silence.

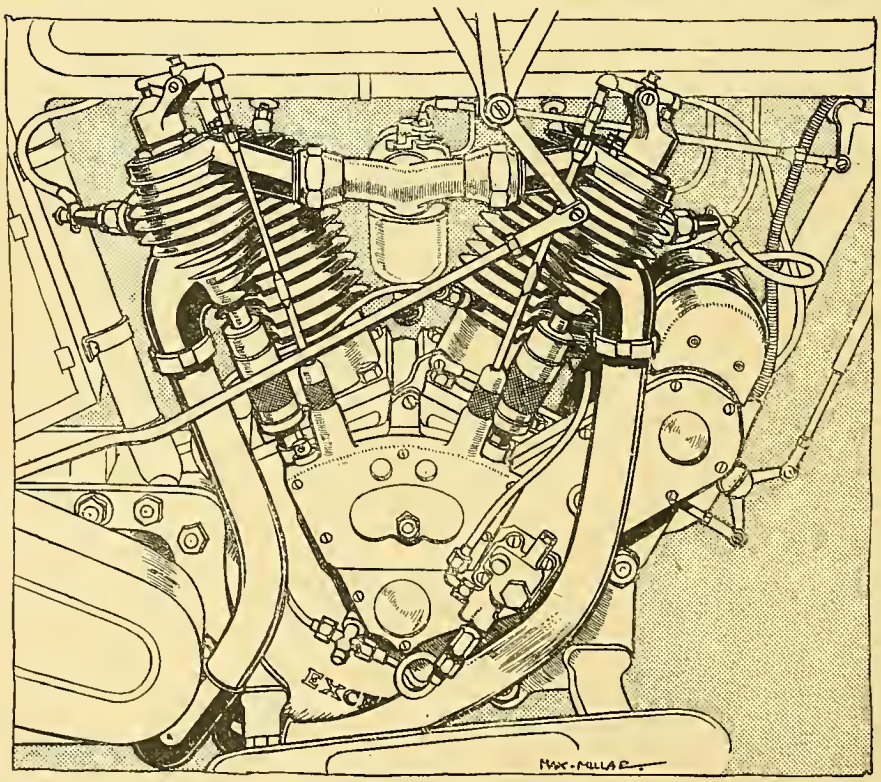
The first impression when riding an Excelsior (solo) is that it is a very comfortable machine to ride. That is to say, the eye is not taken from objects ahead to pot-holes immediately beneath, and one can take a road of the nobbliest sort at 30 m.p.h. without feeling it in one's spine or wrists. This is primarily due to the 3in. tyres, excellent spring forks and saddle, and it is further added to by the handle-bar grips, saddle, and footboards being in their correct position.

The next point is that the engine possesses as much flexibility as power, which further adds to comfort in driving, and it is remarkably silent in running at all speeds, a peculiarity and a virtue of many American engines, which may largely be due, in this case, to the enclosed valve springs. One of the features of this engine lies in the positive feed oil pump, which delivers oil *under high pressure* to the big end bearings as well as direct to the front cylinder, clutch, and gear box. The attention given by the designers of the Excelsior engine in this direction indicates that the Americans are tackling the problem of lubrication in a very thorough manner, and that all responsibility for the welfare of the engine is being taken off the motor cyclist's shoulders when riding. We noticed no sign of vibration with the engine unless travelling at well over 40 m.p.h., and then it so little obtruded itself that it excited no worry. The Schebler carburetter does its work well, and for ordinary conditions is a thoroughly satisfactory automatic carburetter, but we fancy that the fads of home riders would soon take effect in having an extra air attachment fitted



The Excelsior twin-bulb head light.

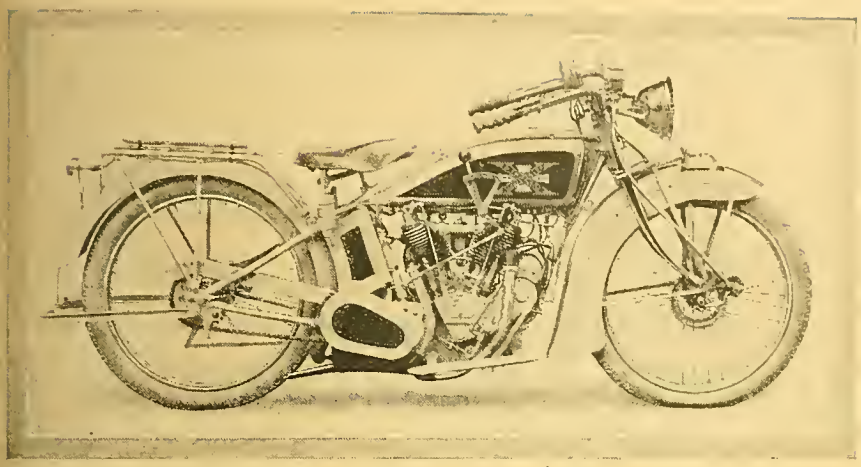
for operation from the handle-bar. This carburetter is remarkably easy to adjust with a view to economy in consumption owing to the variable jet arrangement. Needle valves are fitted to the petrol and oil feed systems, and the unions used on the pipes are equal to those fitted to English machines in point of size and strength.



The power unit of the 7 h.p. American Excelsior.

The Gear Box and Clutch Control.

The ratios of the Excelsior three-speed gear box seem a trifle on the high side for sidecar work in extremely hilly country, being 8⅞ to 1, 6¼ to 1, and 3⅜ to 1 top gear; but, on the other hand, the engine has a very large reserve of power. For abnormal conditions, however, a smaller countershaft sprocket should be obtainable in order to lower the transmission ratios all round. The multiple-disc clutch and gear box seem a sound piece of work on this machine, and, being mounted in a slotted cradle immediately at the rear of the engine, adjustment of the chain transmission is quite an easy matter. It should be noted here that the lubrication of both gear box and clutch is quite automatic, this work being carried out by the forced feed pump on the engine. The operation of the gears is through a substantial car type lever and quadrant on the right-hand side of the tank, in the right position for comfortable handling. The clutch is inter-controllable with the hand and foot, which reduces immensely the labour of dodging in and out of traffic, the control by hand being by the left twist grip, and with the left pedal for the foot. The arrangements of the controls and the comfortable position in which one sits on the machine make it more like driving a car than a cycle,



The 7 h.p. Excelsior, with complete electrical equipment.

particularly in regard to the absence of small control levers. Furthermore, the 3in. tyres fitted to the Excelsior, and the comparatively long wheelbase, make solo riding a pleasure, and, contrary to general impression, we noticed no roll with the large tyres, and the steering could often be taken for considerable distances with "hands off." The latest model has a very pronounced "drop" in the rear part of the frame, consequently the saddle is low, although the wheels are 28in. in diameter. A very excellent device, adding to the all-round comfortable riding of this machine, is adopted in spring-loading the saddle pillar in the frame, which, although an old "gadget" in England, does not seem to be as popular as it should be. Incidentally, the saddle is well padded, and its supporting springs are enclosed in little cases in much the same manner as with car shock absorbers. A feature which again shows that this machine is up to date in design is revealed in the "knock-out" axles, thus allowing both wheels to be quickly removed whilst on the road. The rear wheel hub is extraordinarily massive in size, the centres of the ball races being singularly wide, and the external contracting and internal expanding brakes at the rear again show evidence of the machine being designed for serious work.

The Electrical Outfit.

As with other American types of machines, electric lighting is regarded as more or less standard equipment with the Excelsior, and it is carried out in a very neat manner as regards the wiring and attachment of lamps and horn, etc. The accumulator is carried in a metal case beneath the saddle and is kept charged by a combined Splitdorf magneto and dynamo, which takes up a very small amount of space immediately in front of the engine, and is, at the same time, most accessible. The head light has two bulbs, for either town or country work, and the whole of the wiring is carried in flexible metal sheathing, held by neat little clips to the various parts of the machine. The charging of the accumulator by the mag-dynamo is entirely automatic, and it is only necessary to inspect occasionally the acid in the accumulator. Needless to say, one has only to use this form of illumination for a short period to appreciate its qualities of cleanliness and ease of handling. The tool equipment is carried in a metal case at the side of the accumulator; but we fancy that a pannier bag as an extra would be acceptable, there being plenty of room for it at the rear.

Finally, we should say that the machine, although fairly heavy, is most docile for traffic work, and the throttle can be slammed open without any stuttering of the engine or hesitation. The kick-starter is on the left-hand side of the machine, and the heel arm folds away when the machine is running. The Excelsior machines are produced in two models for this country, the standard three-speed, and the *modèle de luxe*, with the Splitdorf combination lighting and ignition system, lamps, electric horn, and speedometer. Both are chain-driven throughout. Our trial of the Excelsior was arranged by the sole concessionnaires, Messrs. Harris and Sons, 10-12, Great Chapel St., Oxford St., London, W.

Miss Minnie Tulley a professional rider of the American Excelsior, well known at Brooklands

CONDITION OF MAIN ROADS OF KENT.

(1.) WATLING STREET (London-Rochester-Canterbury-Dover).—*London-Chatham* always tram-ridden and crowded. The stretch from *Gravesend* to *Chatham* is in an appalling condition, and should be avoided at all costs by going *via* Singlewell and Cobham Woods (the original Roman road), which is narrow but of good surface and very pretty, and only two or three miles longer. *Chatham-Canterbury* mostly very pot-holey and bad. Boughton Street Hill has the surface quite broken up by war traffic, and the road is particularly bad from here to Canterbury. *Canterbury-Dover* quite good.

(2.) LONDON - WROTHAM - MAIDSTONE-ASHFORD-FOLKESTONE-DOVER.—This road from *London* to *Lenham* is for the most part very pot-holey, and much worse than last year, but there are no dangerously bad stretches, and it is quiet and free from traffic. *Lenham* to *Charing* is good. *Charing* to *Ashford* good. *Ashford-Folkestone* loose and bad in many places between Ashford and Blythe, and extremely bad—continuous motor 'bus "wave formation"—between Blythe and Folkestone. This latter stretch has been marked in the A.A. maps as a war-destroyed road to be avoided; as a matter of fact it was as bad last year, and it is due to motor 'bus activities. *Folkestone* to *Dover* very bad; spoilt in the last few weeks by R.N.A.S. traffic to the airship sheds on it. The best route from Dover to London is *via* Canterbury-Charing-Maidstone, and this should be adhered to even when going to Gravesend. Dover-Folkestone-Ashford should be avoided.

(3.) MAIDSTONE - SEVENOAKS - REDHILL-DORKING.—Condition very fair; better on the whole than other roads described.

Of smaller routes—*Dover-Sandwich* good for these times; *Dover-Deal* good for these times; *Sandwich-Ramsgate-Margate* pot-holey and getting worse; *Canterbury-Sandwich* good: *Canterbury-Ramsgate-Margate* fair.

To sum up, avoid, wherever possible, Gravesend-Chatham, Faversham-Canterbury, Blythe-Folkestone, Folkestone-Dover, Maidstone-Lenham.

NEW MODELS

· MANUFACTURERS' PROGRAMMES FOR 1916 ·

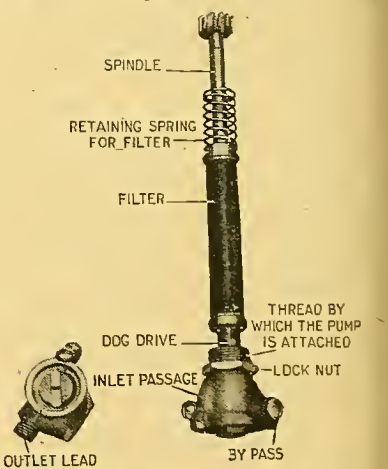
THE LATEST 4 h.p. DOUGLAS.

Improvements in the Lubrication System and Silencing Arrangements.

IN many factories experimental work has been completely dropped, alterations to existing models have been but few—1916 can hold forth little prospect of radical changes or, indeed, even alteration to minor details. Of course, there are exceptions to every rule, and anyone privileged to see the interior of Messrs. Douglas Bros.' experimental department would receive ocular proof that if many firms were content to rest on their laurels, amongst them could not be included the name of Douglas.

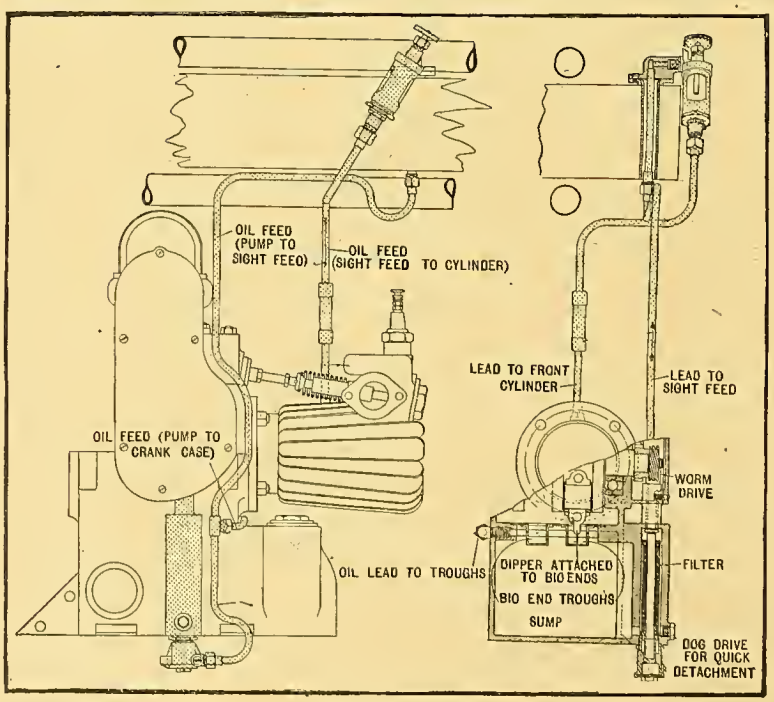
A critical eye would pause on the very latest production in sidecar outfits for the War Office. Here a sight feed lubricator on the tank would cause surprise to those who know the standard practice to be quite mechanical. In the new system, the Archimedean screw has been replaced by a rotary pump driven by a worm off the crankshaft. Three and a half pints of oil are carried, as previously, in the crank case sump, and, as will be clearly seen in the accompanying sketch, the oil passes by a duct through the gauze filter to the rotary pump, which is quickly detached by undoing the oil pipe union and unscrewing the pump base checknut and thread. From this pump the oil is conveyed by an outlet pipe to the junction union, where the oil is at liberty to take two paths. One lead distributes and maintains a constant level in two troughs, into which big end dippers of pre-determined area operate, thus securing by splash the exact amount of oil required by the rear cylinder. It will be seen from the following that no matter what the speed of the engine is the level in this trough is constant, the overflow returning to the sump while the pump delivers such a volume as to overflow the troughs at the lowest possible engine speed. Thus automatically the supply is governed to the back cylinder and other internal bearings.

The other pipe from the junction union leads to the tank, where the oil passes, still under pressure, to the sight feed. This latter is conveniently situated for adjustment from the saddle. Leaving the sight feed, the oil is conveyed direct to the front cylinder, the surplus returning to the sump, where a glass gauge enables the rider to ascertain the oil level at a glance. Circulating as it does through such a length of piping, the oil is effectively cooled during each operation, and, consequently, the sump remains at quite a normal temperature even after a non-stop run of a hundred miles (sufficient oil is carried in the sump for at least three hundred miles), and it is just this little point that has increased



The new rotary oil pump fitted to W.D. 4 h.p. Douglases.

the output of this already powerful engine by nearly 2 h.p. The 4 h.p. Douglas has, we are informed, already climbed Porlock, Lynton, and Beggar's Roost in its stride, and, in fact, a standard sidecar outfit averaged twenty-eight miles per hour from Bristol to the top of the last-mentioned hill, absolutely non-stop.

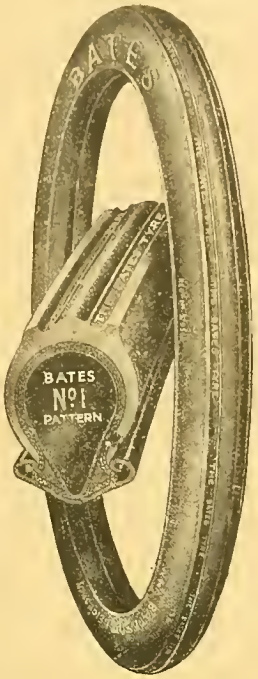


Lubrication system on the latest 4 h.p. Douglas supplied to the War Office.

Silence.

Like the oiling system, the silencer has been entirely redesigned. Long pipes 1¼in. diameter are now led from each cylinder to the rear of the machine, where they converge into a single pipe 1⅝in. diameter, which conveys the gases to a large barrel silencer running towards the rear, and a neat extension pipe completes the design, making an efficient and really silent silencer. Great attention has been bestowed upon the internal details of the engine; the valve mechanism has been further silenced and improved by the introduction of rollers in the tappets. The exhaust valve lifting mechanism is of a new type, and it is now possible to replace a Bowden control in a few minutes with only the aid of a small spanner. The pistons are

"The tyre of no regrets."



THIS happy phrase applies equally to the Bates No. 2 and the Bates Wyvern. Both, with the Bates No. 1, represent tyre economy in its true sense, inasmuch that, reckoning the cost per mile as real tyre value, Bates built are the cheapest on the market.

Decide upon Bates built—and kill tyre-trouble for good. Bates will give you more speed, more comfort, most mileage—at least expense.

REGISTERED TRADE-MARK.

NEW-HUDSON MOTOR CYCLES.

Enduring Satisfaction is only derived from the Motor Cycle which is produced in a factory where expert knowledge, thoroughness, and perfect organisation prevail.

Comfort, Convenience, and restful enjoyment of Motor Cycling depend upon the skill of the designer and the scientific selection of material no less than on the care of the builder.

The New-Hudson combines these qualities in a degree unequalled. Once you own a New-Hudson Motor Cycle, you will not be satisfied with any other.

The Name is a guarantee of that reliability for which New-Hudsons are famous both in peace and war.

A French despatch rider writes:

"My New-Hudson has proved reliable, efficient, and easy to manipulate riding over mountain passes and soaked roads. It is the only machine in this division which has withstood the heavy demands."

New Models and Catalogue for 1916 will be ready in January next, and we invite enquiries for next season's deliveries

THE NEW HUDSON CYCLE CO., LTD., Parade Mills, Birmingham.

London - - - - 43-45. Gray's Inn Road, Holborn.

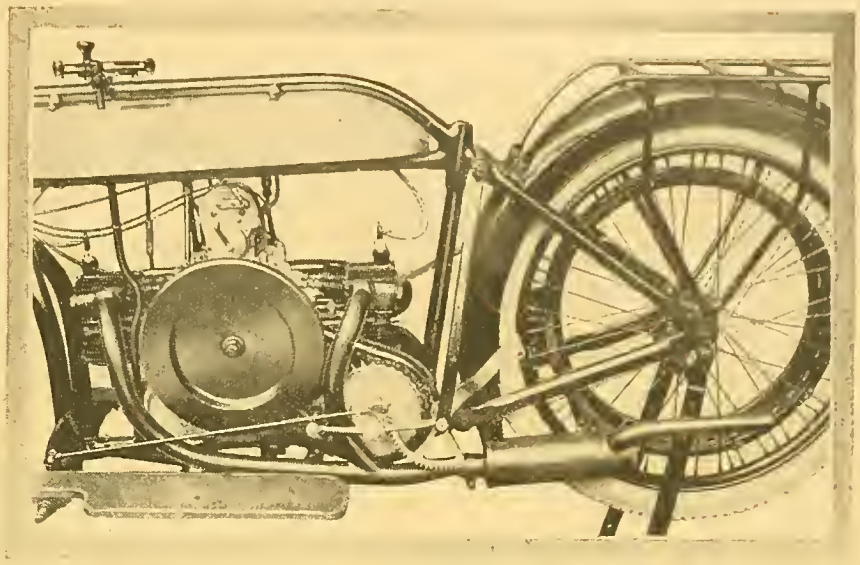
New Models.—

a fine piece of workmanship, and the matter of expansion adequately dealt with, cross webs having been inserted where necessary.

Inspection of the illustrations will show that a third point of suspension has been adopted for the engine in the form of an inverted V bracket from the magneto platform to the secondary parallel rail of the frame.

Very little alteration has been made in the frame, but the bearing area of the fork shackle spindles has been increased, while the shackles or links themselves have been strengthened. The rear brake actuates internally on the V portion of the belt rim, and embodies a compensating spring, thus giving an extremely sweet, but nevertheless positive action. It is coupled by the usual rod to a heel pedal on the rear of the right footboard.

The size of the hubs would convey to the observer in a practical way just how the trial of this great war showed its presence in minor matters. For instance, the hub of the 4 h.p. Douglas is a replica of the hub designed for the 2¾ h.p. Douglas to withstand the awful winter conditions in France.



Flywheel side of the new 4 h.p. Douglas engine, showing silencing arrangement and support for kick starter.

WHAT PREMIERS ARE DOING.

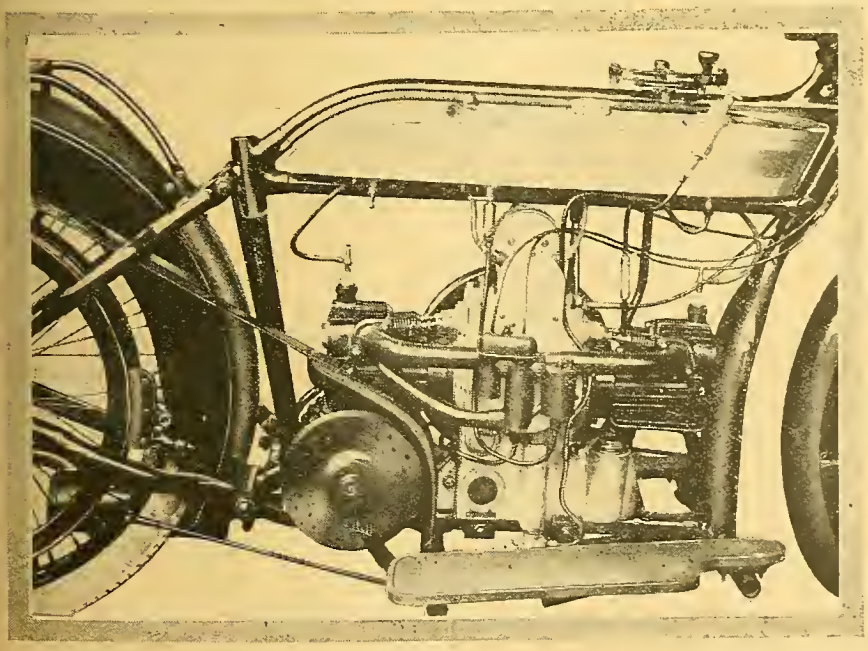
LIKE practically every other Coventry firm, Coventry Premier, Ltd., are busily engaged on munition work, and the selling of motor cycles to the general public is more or less at a standstill. However, it is interesting to know that, although they are in an unfavourable position as regards delivery of the big 7-9 h.p. and the two-cylinder two-stroke models, the makers expect to be in a position shortly to deliver a limited number of the 3½ h.p. single-cylinder machines.

TWO NEW CALTHORPES.

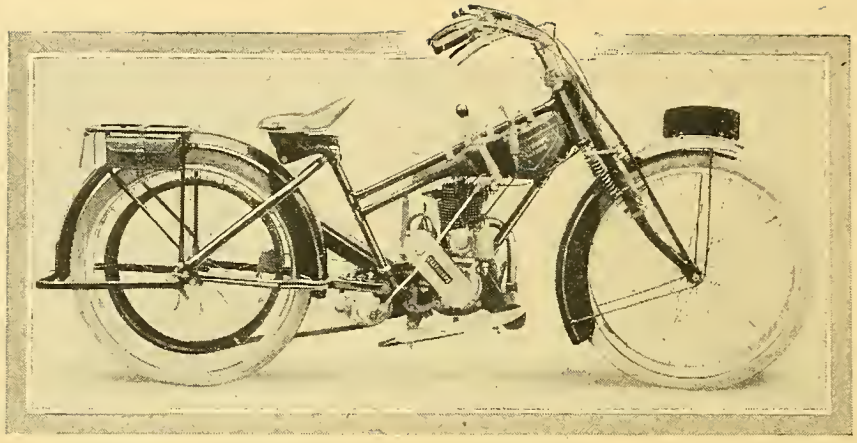
A Ladies' Two-stroke and a 4 h.p. Twin Sidecar with Enfield Two-speed Gear.

AS a result of the growing demand, the Calthorpe Motor Cycle Co. this year has brought out a machine which can be ridden by the fair sex without the necessity of wearing special divided skirts. The machine has a two-stroke engine, with a bore and stroke of 65 × 69 mm. (214 c.c.) In design it is similar to the man's two-stroke manufactured during the last year, and it now has a Senspray carburetter bolted to an inlet pipe on the right-hand side of the engine, and provided with a special shield which prevents the rider's skirts from obscuring the air intake. To the rear of the crank case there is an aluminium platform for the Ericson magneto at present used, although the type of magneto to be fitted to the machine in future is undecided as yet. The frame is peculiar, in that it has a sloping top tube from the head to the seat-pillar tube, while the tube under the tank runs parallel with the top tube for a short distance and then curves away to the down tube from the bottom of the head to the engine bracket, as may be seen in the illustration. Between these two tubes is a wedge-shaped tank, holding approximately one gallon of petrol, very wide in front, but tapering greatly towards the rear, and thus allowing plenty of room for the rider. On the right-hand side, and at the forward end of the tank, is the new Best and Lloyd lubricator, with sight feed glass plate at an angle of 45° and above the main pump. In the machine illustrated the ordinary type of Best and Lloyd is shown, but this will be replaced by the latter model as soon as possible. Formed in the tank is a large slot for the gear lever bracket, which latter is bolted to the top tube, the gear lever being a short nickel-plated piece with a very large knob, giving easy and certain grip. The two speeds in the gear box provide ratios of 6 to 1 and 11 to 1 respectively, the gears, which are always in mesh, being brought into operation by sliding dog clutches.

A combined device is used, the chain from engine to gear box being on the left-hand side and enclosed in a metal



Latest model 4 h.p. Douglas power unit. Note window in crank case sump, improved pattern brake, and conveniently situated pedal asked for by "Ixion."



A new Calthorpe lady's model. It has a 214 c.c. two-stroke engine and combined belt and chain drive.

casing, while the belt, on the left-hand side also, is enclosed for a short distance in a metal casing sufficiently to prevent the dress from becoming entangled or covered with mud during the run. It is probable that an Enfield gear will be used to replace the standard gear on this machine, and that the arrangement of gear control will follow that of the 4 h.p. machine described hereafter. Druid pattern front forks are used, and the tyres to be fitted will be 26in. × 2in. Moseley.

The rear brake is actuated by a pedal on the left-hand side of the machine, and consists of a fibre block mounted on a bracket which can slide along the chain stays, thus allowing the brake to be adjusted without altering the surface in contact with the belt rim.

In order to provide an easy adjustment for the belt, the chain stays are provided with the collar, screw, and locking nut device familiar to riders of ordinary cycles, and it may be here mentioned that the dressguard does not in any way make the belt inaccessible should it be desired to remove it from the machine for adjustment purposes. The position of the gear lever, Senspray carburetter, and ignition controls has been carefully studied, with the result that the machine seems to be in every way fit for a lady to ride. The weight of this model is stated to be approximately 145 lb.

The 4 h.p. Twin.

The second model introduced for next year is the 4 h.p. twin, primarily constructed for sidecar work, and fitted with a J.A.P. engine of 70×64½ mm. bore and stroke (496 c.c.). At first sight the machine is distinctive, owing to the fact that it has what may best be described as a "Zeppelin" tank, and although in the illustration the angles are shown lined out with gold leaf, it is proposed both to shorten the tank and to take one broad band of gold leaf around the outline, thus taking away the somewhat cumbrous appearance which the machine has at present. Like the smaller model, this engine is fitted with an Ericson magneto, although it is by no means certain that this magneto will be the standard. The new Best and Lloyd lubricator also will be fitted, instead of the older type drip feed seen in the illustration, and it will feed to the centre of the crank case, to the forward cylinder and to the gear, thus going one step towards a machine automatically lubricated from one point.

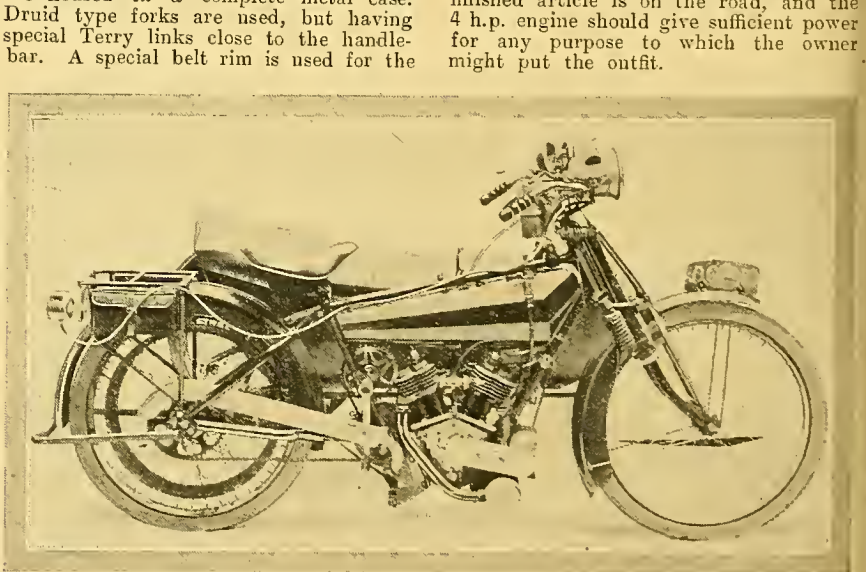
Chain drive is used in conjunction with the Enfield gear, giving ratios of 5½ and 10½ to 1, and having its control lever placed at an angle, thus being out of range of one's knee when driving the machine. There are two shock absorbing devices, the one on the engine sprocket consisting of metal surfaces held up against one another, and slipping only when any jerk comes upon the drive; the other the Enfield cush drive in the rear hub. Over the upper side of the chain is a long but narrow metal casing, and it is proposed to keep to this arrangement rather than the totally enclosed drive, for this reason, that it is far less difficult to obtain access to the chain for purposes of adjustment. The shorter chains on the engine side are housed in a complete metal case. Druid type forks are used, but having special Terry links close to the handlebar. A special belt rim is used for the rear brake, and in this model also the fulcrum point of the brake lever can be moved forward along the chain stay to compensate for any wear in the fibre block.

There is an Amac carburetter clipped to the usual J.A.P. inlet pipe, and in a position where it is accessible for cleaning or inspecting purposes. In the bottom bracket is the eccentric adjustment for the engine chain, which adjustment may be locked in any position by means of a segment and nut. The rear chain is adjusted by the ordinary bicycle type of adjustment already mentioned in connection with the lady's machine. On the seat-pillar tube is a lug holding the sprocket spindle for the starting handle, and bringing the latter therefore into a position where it would not be covered with mud or dust during a run.

For the rest there are a large and comfortable Xl-All saddle, 26×2¼in. Moseley tyres, and the standard carrier, having an acetylene rear lamp fixed to it on a special bracket and fed through a metal tube run along the tank to the generator at the front. At present there is a rubber tube, but the obviously better alternative is to be adopted.

The Sidecar.

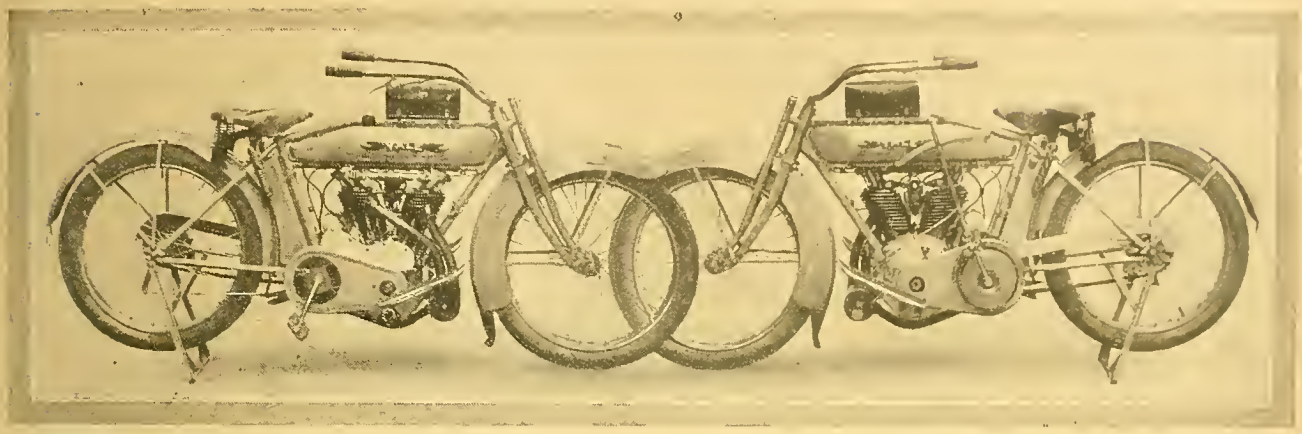
The sidecar shown in the illustration is merely for testing purposes, and the one which will be adopted finally is, we are informed, to be much better finished and upholstered. As the fitting of a side door is a source of weakness to the sidecar as a whole, this has been done away with, and instead there is an aluminium step bolted to the sidecar frame. Two quarter elliptic springs suspend the sidecar at the back, these springs being clipped below the axle, slightly reducing the height of the machine from the ground, while at the front end is a pair of swinging shackles, which will be provided with lubricators in the future. The machine is light, although its weight cannot be stated definitely until the finished article is on the road, and the 4 h.p. engine should give sufficient power for any purpose to which the owner might put the outfit.



Latest model 4 h.p. twin-cylinder Calthorpe passenger outfit. The gear lever, on the driver's left, is placed well away from his legs. The tank, which is of somewhat unusual design, will be shortened on later models.

THE 7-8 h.p. YALE.

The Latest American Arrival. Twin-cylinder Engine of 950 c.c. Two-speed Epicyclic Gear, and Chain Drive.

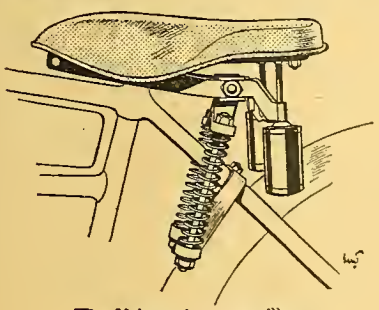


The American Yale, which is a big twin-cylinder chain-driven mount. The countershaft contains a two-speed epicyclic gear

AN American motor cycle which is not altogether unknown to our readers is the 7-8 h.p. Yale, now offered for sale in England. A striking feature of the 82.5 mm. × 89 mm. twin engine is the horizontal position of the radiating fins, which, as may be supposed, greatly facilitates cooling, as a direct draught of air is allowed to pass fore and aft through the fins. In the design the engine follows the usual American practice, being provided with the usual type of exhaust valve and overhead inlet valves. The rockers and valve stems are enclosed in a dustproof case, with the object of minimising wear.

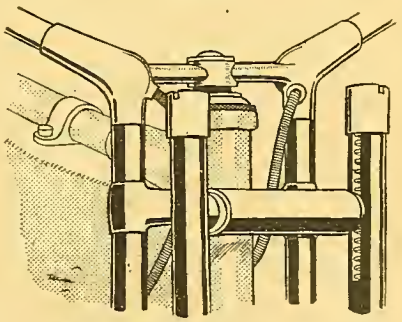
An Adequate System of Lubrication.

Lubrication is effected by means of a mechanical plunger pump of the positive type driven off the timing gear by means of a worm. The oil is taken from a tank behind the saddle pillar to the front cylinder and to the timing gear; a separate hand pump is provided so as to give the crank case the necessary amount of oil before starting for a run, in case there should be any shortage, while a window in the off side of the crank case clearly shows the level. The lubrication is further assisted by means of a self-contained oil reservoir for the crank pin bushes and a system of oil channels, thus ensuring perfect lubrication of all the bearing surfaces. The crank pin bushes are of a special alloy, and the bearings of ample size.



The Yale spring seat-pillar.

It will be noticed from the illustrations that the magneto is neatly carried behind the engine, and is consequently in a protected position. The engine is held into the frame by means of the usual bolts and lugs, but the cylinder heads are further stayed by means of clamps on the top tube. The frame follows more or less standard lines, the low saddle position being afforded by dropping the top tube at the rear. The tubes employed in its construction are heavily reinforced.



Yale spring forks, showing handle-bar fixing. Note how the control wires pass through the bars

The silencer arrangements are particularly well carried out, the two exhaust pipes entering the top thereof with an easy sweep, thus giving free exit for the gases. The silencer itself is merely an expansion chamber, while there is a long exit pipe carried away to the rear. The gas is supplied through a Schebler automatic carburetter.

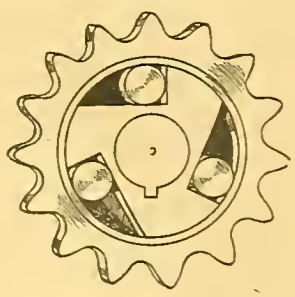
The spring forks are neat, and one of the accompanying sketches shows the method of construction. The handle-bars are connected to the fork stays and steering head by a drop forged crosshead anchored at three points, so that the bars cannot twist out of line with the front wheel when heavy strains are put upon them. It will be apparent that the coil springs are adequately protected from the ingress of mud and grit. The mudguarding is good, and it is interesting to note that the rear guard is hinged at its centre, thus allowing free access to the back tyre.

Novel Kick-starter Design.

A kick-starter is provided, which is operated by means of pedals, the free-wheel on the engine-shaft being of simple and efficient design. The accompanying sketch shows that it consists of rollers working in triangular spaces in the small chain wheel. When the pedals are brought into operation these rollers are forced towards the apex of the triangle; when pressure ceases to be applied the rollers drop back into the base of the triangle and the free-wheel is instantly freed. The chain on the starter is interchangeable with the short chain from engine to gear box.

Rather a departure from standard practice is the provision of an epicyclic two-speed gear on the countershaft, which may be engaged either by means of a pedal or by the long lever shown in one of the illustrations.

The control of the magneto advance and the throttle are by means of the usual twist handles, but a separate lever is used for raising the exhaust valves. A good saddle, working on a hinged spring seat-pillar, is provided. The Yale is handled in this country by Mr. T. Baxter, 36, Great Eastern Street, E.C.



The free-wheel on the Yale kick-starter The position of the rollers shows that the kick-starter is out of action.

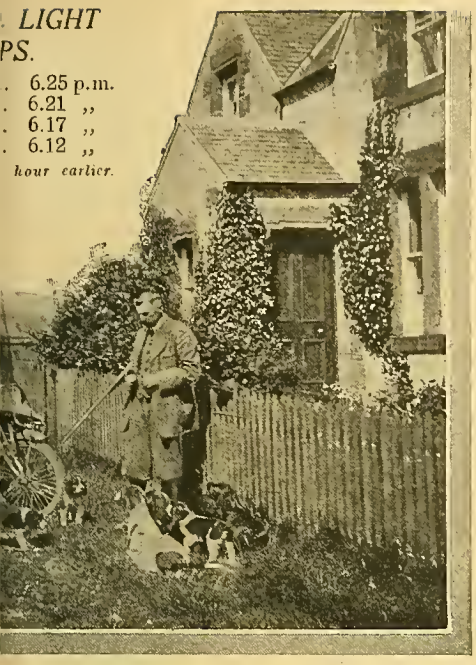
hour earlier.



Government Work means No Change for 1916.

The Phelon and Moore works are now under Government control, and the Union Jack proudly flies over the company's busy workshops. The P. and M. programme for 1916 can for this reason be summed up in the phrase "No Change"—a remark which applies to quite a number of leading motor cycle manufacturers.

The Munition Workers' Competition.

The suggested competition for motor cyclist munition workers is still engaging the attention of Midland motor cycle clubs. It would appear that the clubs are favourably inclined towards the idea suggested in our columns last week, viz., that the different Midland bodies should combine to organise such an event, the proceeds to go towards providing comforts for fellow club members on active service.

The Wolverhampton Motor Cycle Club has held a second committee meeting to consider the matter, and resolved to send out letters to the Auto Cycle Union and the other Midland motor cycle clubs, asking their opinion as to the form the trial should take. The Wolverhampton Club—which, by the way, was first in the field in connection with the suggestion—considers that the event should not be run off until November, but at the same time it is recognised that so late a date is not conducive to a big entry. Consequently the club is not disposed to risk an outlay of £35 to £40, which is necessary for the successful running of an important open event of this kind, without some guarantee of the support likely to be received.

Mr. Alec Ross, who took the chair last spring at a concert organised by the Birmingham motor cycle clubs, to provide funds for colleagues at the Front, is very keen on the suggested competition.

A reliability trial seems to be preferred to a hill-climb, as in the case of the latter a special type of machine is desirable. This would be a detriment in the case of munition workers. Perhaps a half-day reliability trial, including one or two sporting hills, would best fill the bill.

Vancouver to France.

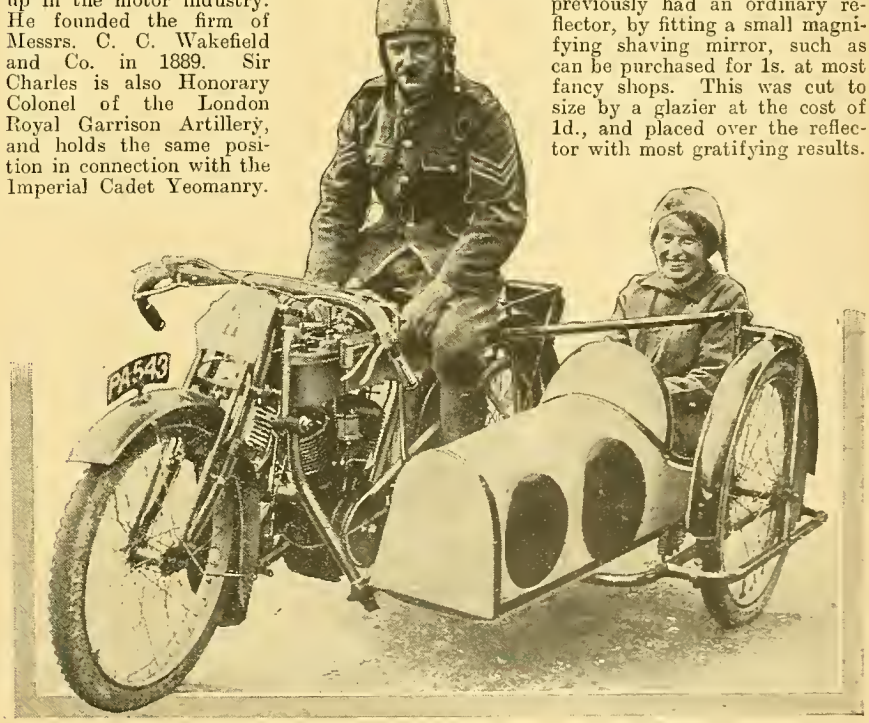
A photograph taken at Vancouver and reproduced in a recent issue showed a heavyweight man and a lightweight both mounted on the same motor cycle. The reproduction of this photograph has brought forth a request for a copy of the photograph from a Canadian sapper now serving in France with the 1st Canadian Division Signalling Company, who recognises in the group his two brothers and two friends. Thoughts of home brought by *The Motor Cycle*!

Mud-covered Despatch Riders.

We have not heard very much lately of despatch riders at the Front, but a British correspondent at the headquarters writes: "The roads, except those paved, acquire a deep coating of thin, glutinous mud. Everything becomes covered with it. Long files of marching men, their waterproof sheets pulled right over their heads, plodding steadily through the slush, chanting a chorus; the endless columns of heavy motor lorries; staff cars, pushing through the ruts at the side in their efforts to make way through the crush of traffic, become scarcely distinguishable from the road itself; motor (cycle) despatch riders, who suffer most of all, appear, machine and man, as one mass of grey splashes."

The Lord Mayor Elect.

Colonel and Alderman Sir Charles Wakefield, the new Lord Mayor elect of London, was born in Liverpool, and first attained distinction as a player of Association football, and as a runner. He has long been engaged in the oil trade, and his company, which manufactures Castrol, has done a great deal towards solving many lubrication problems which have cropped up in the motor industry. He founded the firm of Messrs. C. C. Wakefield and Co. in 1889. Sir Charles is also Honorary Colonel of the London Royal Garrison Artillery, and holds the same position in connection with the Imperial Cadet Yeomanry.



A novel sidecar attached to the 8 h.p. Zenith, ridden so successfully by Sergt. Barker at the Army and Navy hill-climb reported in our last issue. For speed and lightness it is doubtless just the thing It is known as the Middleton.

CURRENT CHAT

The National Relief Funds.

At the week-end the principal relief funds stood as follows:

	£	s.	d.
The Prince of Wales's Fund	5,530,270	0	0
The Queen's Work for Women Fund	165,457	14	6
Belgian Relief Fund ...	950,000	0	0
The Weekly Dispatch Tobacco Fund	85,049	0	0
The Times Fund for the Sick and Wounded ...	1,687,043	3	9

Special Features of this Issue.

Elsewhere in this week's issue will be found some new 1916 models fully described and illustrated. Four pages are devoted to this subject, each make being thoroughly dealt with. Attention is also drawn to the development of the lightweight machine in America. We deal with this matter in a leading article and also on pages 355 and 356.

A Substitute for a Mangin Lens.

A correspondent tells us that he has considerably improved the light giving powers of his head lamp, which previously had an ordinary reflector, by fitting a small magnifying shaving mirror, such as can be purchased for 1s. at most fancy shops. This was cut to size by a glazier at the cost of 1d., and placed over the reflector with most gratifying results.

CURRENT CHAT

The Latest

Zeppelin tanks are the latest thing in motor cycles for 1916.

From Two Continents.

On Monday morning our post bag contained a letter from North Persia, from a prospective buyer of a motor cycle. The letter made no reference whatever to the war, despite the fact that it emanated from such a troublous land. On the same day we had an enquiry from a reader in Northern Nigeria, and several letters from men serving in France.

Woolwich Club and the Proposed Munition Workers' Trial.

From a conversation with one or two of the members and officials of the Woolwich and Plumstead M.C.C.—composed principally of foremen and skilled munition workers at the Arsenal—a correspondent learned that there was little prospect of any members entering for the proposed trial. A Midland or Northern locale would be entirely out of the question. If possible a separate trial should be organised in the South of England.

A Motor Cycle Club for Rio de Janeiro.

As a natural result of the growing popularity of motor cycling in the capital of Brazil, the Rio Moto Club has been formed. It is the first club of its kind to be inangurated in Rio, and the following officers have been elected : President, Dr L. C. Leite; vice-president, Lieut. E. C. de Mello; treasurer, N. Marinho; secretary, E. Dutrain. Headquarters have been secured at Rua da Alfandega, N. 130. We wish the club and its members every success.

Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model, the average for the past week is quoted. If at least two machines were not advertised, the last occasion within the past month on which they were quoted is given :

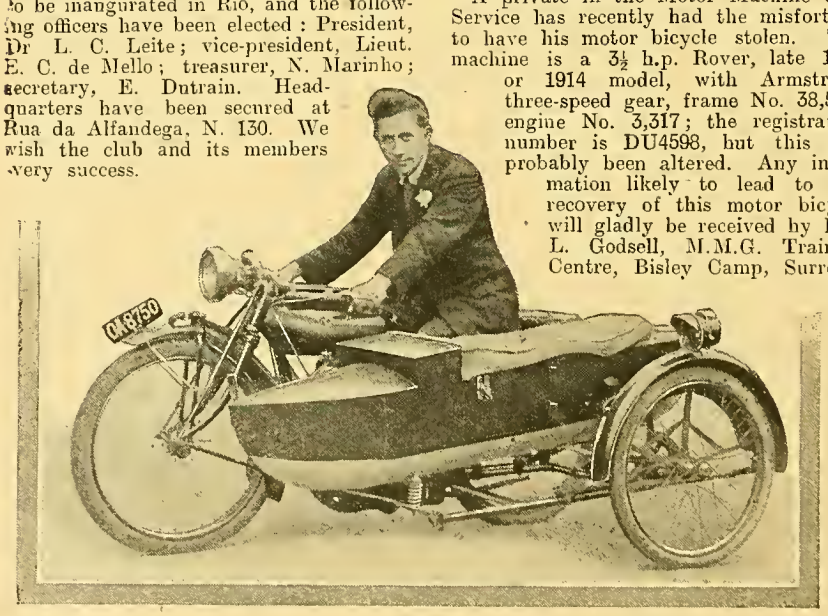
A Stolen Machine.

A private in the Motor Machine Gun Service has recently had the misfortune to have his motor bicycle stolen. The machine is a 3½ h.p. Rover, late 1913 or 1914 model, with Armstrong three-speed gear, frame No. 38,516, engine No. 3,317; the registration number is DU4598, but this has probably been altered. Any information likely to lead to the recovery of this motor bicycle will gladly be received by Pte. L. Godsell, M.M.G. Training Centre, Bisley Camp, Surrey.



An attractive sporting boat-shaped sidecar attached to a 5 h.p. Indian. It is "home-made," and is a credit to the owner, Mr. Hiskins, of Saltley, Birmingham.

A LOWLAND SCENE.

There is plenty of game in Scotland this season, but few guns. This illustration shows a young Scottish laird and his head keeper, accompanied by a few of their dogs, which, like their owners, are living in happy anticipation of the days when the guns will return.

A Copied Number.

A contemporary states that 4,028 applications for despatch riders have been received by the Royal Engineers up to the present. This figure is quite wrong, and our contemporary has no means of ascertaining the number. That quoted was apparently copied from *The Motor Cycle* of September 23rd, but the number represents the applications from motor cyclists dealt with by the Editor of this journal for several different branches of the Service, including R.E., M.M.G.S., and A.S.C.

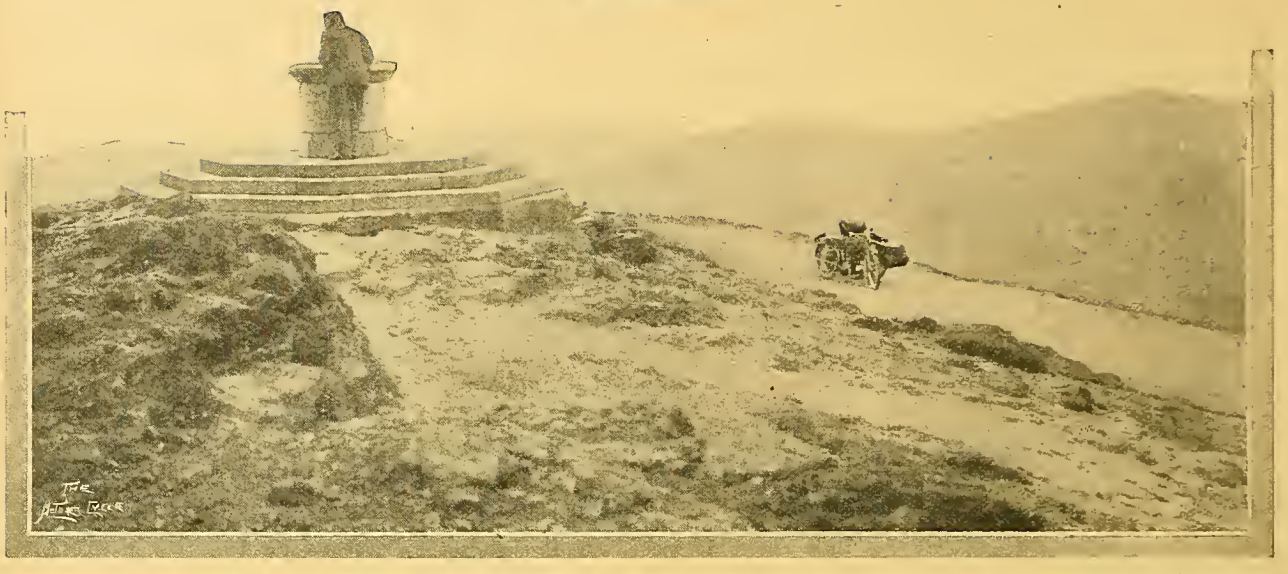
The Dartmoor Roads.

The main road across Dartmoor from Exeter to Tavistock was in excellent order a few weeks ago, and the scenery at this time of the year is gorgeous. The winding road through the woods up the long ascent of Duccombe, between Exeter and Moretonhampstead, is well engineered and the views magnificent. The day on which we crossed the moors was bright and breezy, and it was very pleasant coasting down the long hills at speed with the engine at rest. Continuing into Cornwall, we found the famous hill at Gunnislake in rather bad order owing to traction engine traffic, but beyond this point the roads were in fine condition.

A Boat-shaped Sidecar.

Of novel and weird design are many of the sidecars met on the road nowadays, and in their zeal for turning out something startling designers often overlook the fact that an ordinary human being has to occupy the sidecar for perhaps hours at a time. However, such a charge can hardly be levelled at the body reproduced on this page, and which, although on distinctly sporting lines, is yet, we should say, comfortable to ride in, provided one is accustomed to the lying down attitude which must be assumed.

Mr. Hiskins, who designed and built the body in question, has succeeded in evolving a very attractive and distinctive body, one which at the same time lends itself to speed work. It is only fair to add that the body in question is not original—Mr. Hiskins does not claim it so—as a skiff body was used in 1914 by a Coventry rider.

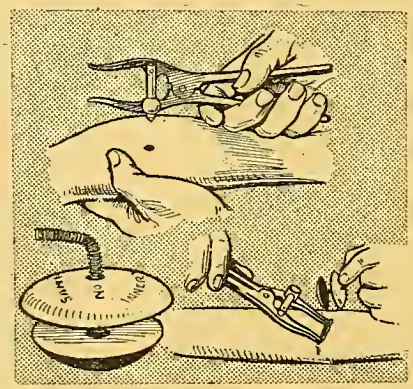


TO THE TOP OF THE WORCESTERSHIRE BEACON ON A LIGHTWEIGHT SIDECAR.

A two-stroke chain-driven Excelsior sidecar outfit at the top of the Worcestershire Beacon, which made the climb by the donkey path without a stop. There was no passenger, but the sidecar contained spare petrol and the rider's luggage. This model Excelsior has a two-speed box, and the gear ratios, we are told, were 13 and 6 to 1. It may be recalled that a 5-6 h.p. Excelsior made the first sidecar ascent of the Beacon under our observation a few years ago

THE SAMPSON REPAIR OUTFIT.

WE have lately received from Messrs. Brown Bros. a sample of the Sampson repair outfit, and the accompanying sketch shows clearly how the system operates. It will be noticed that the outfit consists of a number of special plugs (shown in the bottom left-hand corner of the illustration), which are threaded together by means of a short brass screw bent over at right angles, and a special tool is also supplied. When the puncture is located the sharp end of the tool (shown in the top illustration) is inserted in the puncture, and the tool is gripped like a pair of pliers. This has the effect of punching a neat round hole in the tube. The ends of the tool are then inserted in the hole, and the puncture expanded so that the lower end of the plug may be inserted in position. Afterwards it is only necessary to grip the bottom of the plug by pinching the outside of the tube and screwing up the top half tightly, while the next operation is to bend back the brass spindle and snap it off close to the top. The result is a permanently repaired puncture, which is quite unaffected by heat.

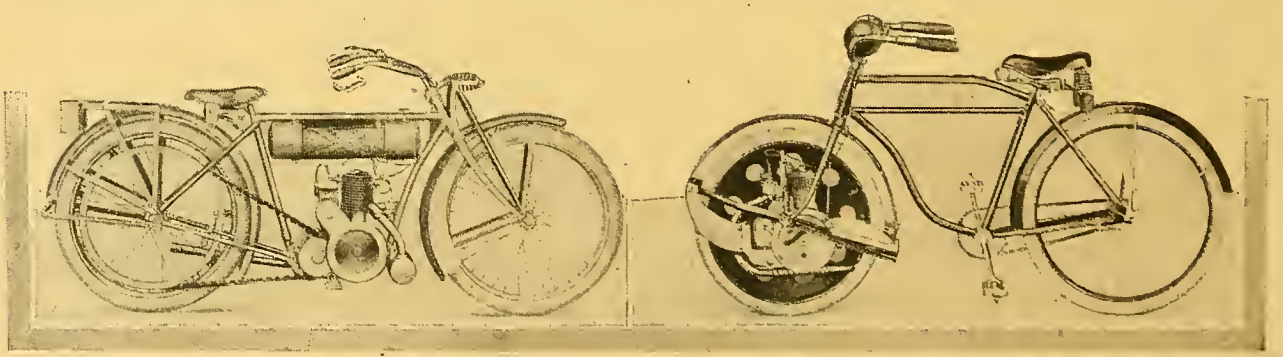


The Sampson method of repairing a puncture

NEWS FROM SERGT. W. A. DAVENPORT.

WE were surprised and sorry to hear that Sergt.-Artificer W. A. Davenport, the former Lea-Francis rider and now of the M.M.G.S., had been through such a serious and long illness. Some time ago we mentioned that he was in hospital at Rouen, but since then complications set in after pneumonia, and Davenport has had a bad time. However, he is much better now, and is in a hospital at Poole, from which place he has written us a cheery letter. He speaks in high terms of the considerate treatment he received in the Rouen hospital—where he was over three months—from the senior officers downwards. The C.O. and the second in charge, Davenport added, are keen motorists, and through the kindness of the latter Davenport was able to get *The Motor Cycle* regularly.

Our many readers who know Sergt. Davenport will join us in wishing him a complete and rapid recovery.

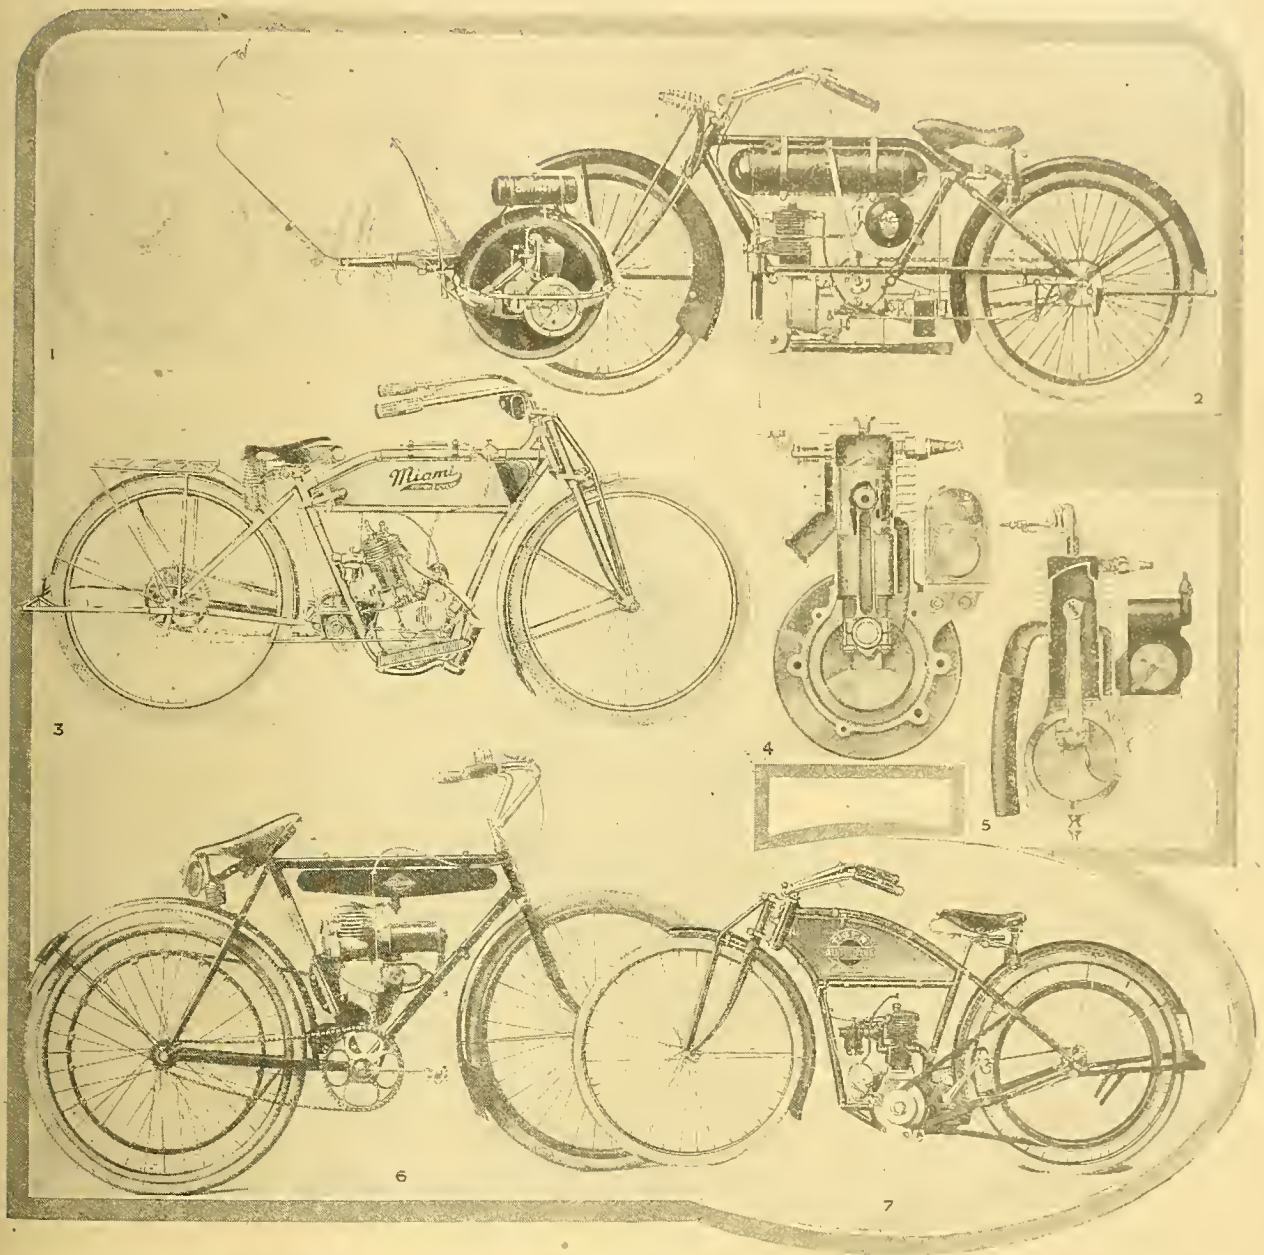


THE UNITED STATES AND LIGHTWEIGHTS. (See next page.)

The American Excelsior two-stroke, which might well be taken for a French grey Triumph—on paper.

The front wheel driven Dayton, one of the American freaks for 1916. It is announced as the "world's lowest-priced complete motor vehicle."

Lightweight Motor Cycles at the Chicago Show.



(1) The Smith wheel attachment. (2) The two-stroke Cleveland. (3) The Miami, which has a four-stroke engine. (4) Excelsior and (5) Indian two-stroke engines. (6) The Cyclemoter lightweight. (7) The Tiger lightweight.

THE Americans have at last followed the example of British manufacturers and given some attention to lightweights, both two-stroke and four-stroke, and several machines of this type were seen at the Chicago show. In some cases they seem to have paid us the compliment of following our designs rather closely. Some of the leading examples which made their first appearance are illustrated above and referred to in the following notes.

THE EXCELSIOR LIGHTWEIGHT is fitted with a two-stroke engine of the three-port type. The piston is perforated on the transfer port side, and the release valve connected with the exhaust port by a passage cast with the cylinder after the manner of the baby Triumph. The frame differs from the large Excelsior, in that it is of the loop type.

THE MIAMI POWER BICYCLE is made in three models, but two of these differ only in the matter of ignition, one being by dry battery and coil, the other by magneto (fixed ignition). Both are driven by flat belts. The 2½ h.p. Miami engine is a four-stroke, 63.5 bore and stroke (201 c.c.), having a roller bearing in the big end. It is inclined slightly rearwards in the frame, and fed by a Miami carburetter which has an adjustable jet. The third model is chain-driven, and is fitted with a two-speed countershaft gear with gears always in mesh and a double dog clutch, the gear ratios being 6.3 and 11.5 to 1. The friction clutch has four Raybestos discs interleaved with steel plates and requires no lubrication. An electric lighting outfit can be supplied with this machine; it consists of a set of dry cells, a head light, and a tail lamp.

Lightweight Motor Cycles at the Chicago Show.—

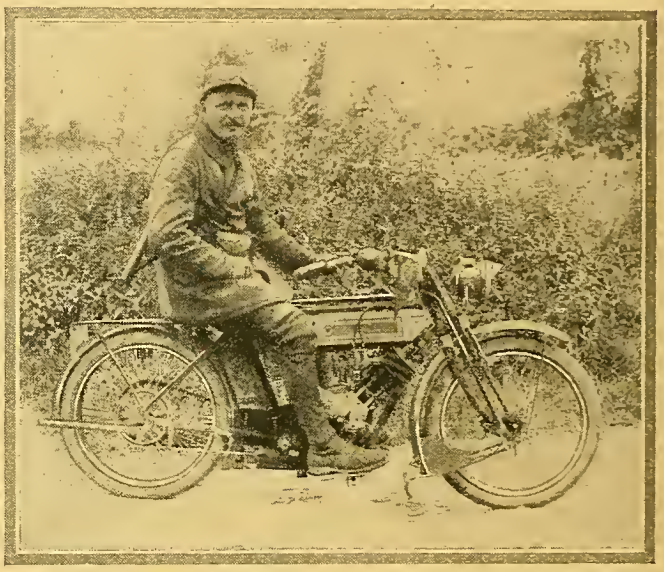
THE TIGER AUTOBIKE incorporates the Frederickson engine, which is rated at 4½ h.p. at 1,100 r.p.m.; the bore and stroke are 63.5×76 mm. (241 c.c.) It is on the two-stroke principle, but the transfer passage is connected to the cylinder head by a pipe containing a poppet valve which conducts the gas to the top of the cylinder. The carburetter is also connected to this passage through another automatic valve. For this method is claimed a cleansing and cooling action, together with a freedom from reversing and backfiring. The ignition is by a gear-driven magneto placed before the engine. It is claimed that this machine is capable of running 140 m.p.g.; it is finished in tiger yellow with black stripes, and sells at one dollar per lb. The tyres are 28×2in.

THE CLEVELAND LIGHTWEIGHT has recently been described and illustrated in our pages, and it has been compared to the two-stroke Triumph on lightweight F.N. lines. The engine, a two-stroke of 63.5×69.8 bore and stroke (220 c.c.), is rated at 2½-3 h.p., and set across the frame, *i.e.*, with crankshaft longitudinal. It is built in a single unit, with two-speed gear and magneto, the whole of which can be quickly removed from the frame. The petroil method of lubrication is adopted, and a B. and B. carburetter is fitted.

THE SMITH MOTOR WHEEL, an adaptation of the Auto-Wheel, was also in evidence.

THE CYCLEMOTOR is a power unit of about 1 h.p. (91 c.c.), built for the purpose of converting a pedal bicycle into a lightweight motor cycle; it can be fitted to any diamond frame machine of sufficient strength, and is said to be capable of a speed of 20 m.p.h.

THE INDIAN TWO-STROKE LIGHTWEIGHT was described last week; therefore we need only refer to it now. It has a 2½ h.p. engine and a three-speed gear.



The above French despatch rider, in forwarding his photograph, reports as follows: "After 25,000 km., the faithful P. and M. continues to behave well, in spite of the terrible state of the roads at the Front. The P. and M. was the first motor cycle to arrive among the ruins of Carency."

End of the Irish Competition Season.

Hill-climb at Cork.

THE hill-climbing competition for the cup presented by Capt. Pike was held on Wednesday afternoon last week on the hill leading from the Lough to Ballinhassig. A somewhat novel principle was used to arrive at the winner. The competitors were sent up the hill singly in the first instance, and the relative merits of their performances were determined by *The Motor Cycle* formula $\frac{C \times t^2}{W}$. The four best competitors on the formula results afterwards competed in a handicap, in which the starts were fixed by the differences between the times in the first trial. The fact that the riders had to do their best to get into the final quartette prevented any attempt at pulling in the first trial. The plan worked out very satisfactorily, although two of the finalists failed to ride up to their first performances.

The results on formula were as under:

		Fig. of merit.	Time. secs.
1.	R. S. Russell (2¾ Douglas) ..	1,717	39
2.	M. J. Fitzgerald (2 Levis) ..	1,847	53¾
3.	F. L. Dooley (4¼ B.S.A.)	2,112	40½
4.	Sergt. Hughes (3½ Triumph) ..	2,210	40⅘
5.	E. G. Jack (3½ Rover)	2,445	46⅘
†	M. English (2¾ Douglas) ..	2,550	49⅘
†	J. Hennessy (5 Indian)	2,550	38⅘

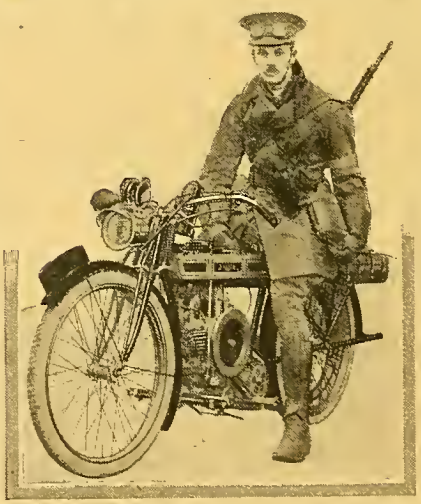
The handicap result for the cup was as follows:

		H'cap.	Actual time.	H'cap time.
1.	R. S. Russell	¼s.	39⅘.	38¾
2.	Sergt. Hughes	2⅘s.	42	39⅘
3.	M. J. Fitzgerald	15⅘s.	70	54⅘
4.	F. L. Dooley	2s.		failed

The competition being the last of the season, it is now possible to announce the winner of the English Cup, offered for the best aggregate marks in the competitions of the year. The cup is won by the popular hon. secretary, R. S. Russell, who was also the winner of Wednesday's hill-climb.

Dublin Club's Half-day Trial.

The concluding competition of the season of the Dublin and District Motor Cycle Club was held on Saturday afternoon, when a half-day reliability trial arranged by the president of the club took place.



A despatch rider attached to the R.E. Signal Section, with his complete equipment, which includes the inevitable Douglas. The rider in question, Corporal J. Stuart Hyde, speaks very highly of his mount

The conditions of the competition were not made known to those taking part until they assembled at the foot of the Dublin Mountains at Rathfarnham. Speedometers were disconnected and route cards were distributed, the latter giving the course without mileage. It lay for the greater part in the southern portion of the Co. Dublin, and embraced two well-known test hills, the long ascent through the Pine Forest of Glendhu to the top of the Featherbed Mountain, and the Devil's Elbow, a hill with two sharp hairpin bends on the borders of the Co. Wicklow.

None of those who competed failed to make a clean ascent of the two hills. A speed of eighteen miles an hour was scheduled for the first portion of the journey, and a speed of twenty for the remainder. A number of the competitors were caught napping at the one secret check that was taken at Glencullen, despite the liberal variation allowance of three minutes. The route ran from Glencullen to Bray by Golden Ball, and crossed the Scalp Road and the Ballyman Road. Silver souvenirs were offered to all obtaining 98% of the full marks, and the following were thus qualified:

R. Roche (3½ Rover)
A. W. Mooney (6 Bradbury sc.)
J. C. Cunningham (4 Bradbury sc.)
J. Browne (3½ Rover)
C. B. Franklin (7·9 Indian)
S. Morrogh (3¾ Scott)
S. Allen (3½ James)

"THE MOTOR CYCLE" RECRUITING SECTION.

R.F.C.

WITH reference to the appeal for motor cyclist recruits for the Royal Flying Corps a few weeks ago, the following letter has been received by the editor from Major W. E. S. Burch of the R.F.C. military wing: "I note the large number of applications which have been received for recruits. I am most grateful to you for the trouble and good work you have done."

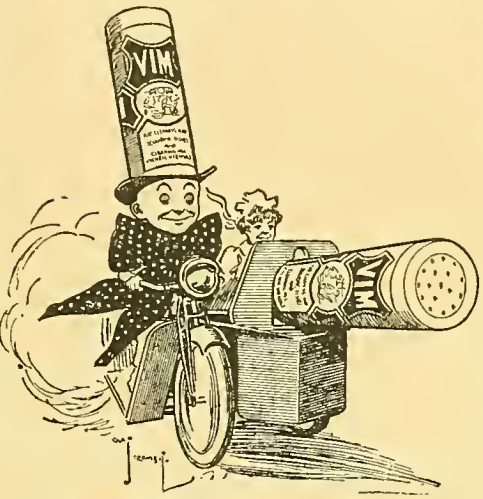
MOTOR MACHINE GUN SERVICE.

ALTHOUGH recruiting for the ranks of the M.M.G.S. ceased some weeks ago, there are still vacancies for a number of skilled motor cycle mechanics with workshop experience, also for car drivers having at least two years' driving experience. Applicants should communicate with Mr. Geoffrey Smith, Editor, *The Motor Cycle*, 19, Hertford Street, Coventry, stating age, height, chest measurement, and when free. Applications should be accompanied by two original references from employers.

Some recent recruits are:

W. Bell.
R. Bownass.
C. H. Carthorpe.
J. V. Gandy.
E. J. Sheldon.
W. M. Thomas.
R. Wray.

R. Bownass, well known as a T.T. rider and formerly with the Matchless and Nut-Jap firms, is the latest recruit. He is an A.S.C. artificer attached to the M.M.G.S.



An amusing illustration reproduced in a daily newspaper advertisement of a well-known household cleanser. The artist has evidently heard of the motor machine gun batteries!

A CHANCE FOR LADIES TO HELP.

LADY motor cyclists in Warwickshire who would care to assist with the National Register should send in their names to the Editor, giving some idea how much time they could spare per day or per week. This appeal is made at the request of the military authorities, who have already accepted the services of two Warwickshire lady motor cyclists who voluntarily offered their help to us in recruiting some weeks ago.

R.E. DESPATCH RIDERS.

DURING the last few days over a dozen motor cyclists in the South Midland divisional area have visited Coventry for the purpose of passing the necessary tests to qualify them for positions in the Despatch Riders' Section of the Royal Engineers.

As a matter of fact, over 125 enquiries from prospective D.R.'s have been received during the last fortnight from all districts; all particulars have been furnished and the enquirers referred to the nearest inspecting officer, that being the more convenient procedure form the recruits' point of view.

STILL CHEERFUL AFTER THE HARDSHIPS OF DESERT WARFARE.

Douglas motor cycles at Cape Town after their return from German South-west Africa. Out of twenty-eight used by the Forces, twenty-three, we are told, returned from the Front in perfect running order. The motor cyclists have either already joined or are joining other branches of the Army, as their own section has now been disbanded.

MOTORING IN SWITZERLAND IN WAR TIME.

WE have lately had a visit from M. Jules Neher, managing director of Motosacoche, Ltd., and president of the Swiss Motor Cycle Union. At the outbreak of war M. Neher had some difficulty in getting back into his own country. France was naturally closed to him, and, being in Italy, he made a dash for the Great St. Bernard Pass, which is open to motor vehicles on the Italian side only. The Italian Customs House officials told him that he would certainly be stopped in Switzerland, as all motor vehicles were forbidden to pass over the frontier. He told them not to worry, and proceeded on his Motosacoche sidecar machine. Nothing happened till he got right to the bottom. The jovial *gendarme* and he had a friendly talk, with the result that, after having discussed the matter over a bottle of wine, M. Neher was able to continue his journey.

During the first six months of war no petrol was sold in Switzerland for private purposes, only doctors and a few people who had to use motor vehicles for business purposes being allowed to ride motor bicycles or drive cars, the petrol being reserved exclusively for the use of the military. Petrol in normal times in Switzerland averages 2s. a gallon, and in war time it is sold at practically double that price. English motorists are better off even now.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Scott Lubrication.

Sir,—Have any of your readers tried lubricating this machine with a mixture of petrol and oil as on the smaller two-strokes? I have been using this system now for some time, and should like to know if it has any disadvantage. The amount of oil used is one pint of oil to two gallons of petrol. I should be glad of any Scott owner's experience in this direction. T.E.D.

Silencing the Exhaust.

Sir,—It may be of interest to your readers to note that it might be possible to soften the bark of a 3½ h.p. T.T. single fitted with a long exhaust pipe minus a silencer by introducing a retarder into the pipe, such as employed in oil

A silencing idea consisting of a twisted metal strip inserted in the exhaust pipe. (See letter from J. B. Bose.)

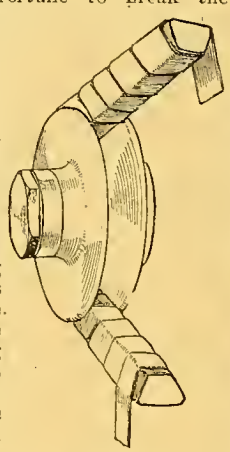
coolers, condensers, etc. A retarder is simply a narrow metal strip twisted in the form of a helix, as shown in the sketch. There is no reason why such an arrangement as this should create excessive back pressure. J. B. BOSE.

Some Useful Tips.

Sir,—I wonder if any of your readers have tried mixing a little paraffin oil with petrol. I find that it prevents the piston from getting gummed up, as well as being economical.

Whilst on tour I had the misfortune to break the petrol pipe which leads to the carburetter. As I had no means of repairing it by soldering, a length of young ash stick was cut from the hedge, and with a strand of barbed wire broken from the neighbouring fence a hole was bored in the centre of the stick, this being quite easy, as it consists of pith. The ends were then widened with a penknife, to slip outside the tube, some twine being tied over and under the stick. This repair carried me safely home.

Broken petrol pipe temporarily repaired by means of hollow stick bound round with string.



Cloth strip wrapped round belt to take up slack. (See accompanying letter from R. Irwin.)

If a belt becomes too loose to drive the machine, and there is no way of tightening it, it can be tightened by tying securely some lengths of cloth (or twine) along it, provided the engine pulley is deep enough. The above makes the belt larger, which raises it higher in the pulley and so effects the tightening. R. IRWIN.

Clergymen and Waiving the Petrol Tax. Why Not?

Sir,—In view of the increased tax on petrol, I think that a certain class of motorists might claim your aid. I allude to those clergymen who, like myself, find the motor cycle an absolute necessity for their work. If we wish to insure, we, as "professional men," must pay more; therefore, as professionals, we, like the doctors, should pay less petrol tax. For my part threequarters of my mileage has been for duty. Perhaps, Mr. Editor, you can come to our aid. 2¾.

[It does not seem at all unreasonable that clergymen should be placed on a par with doctors in regard to the petrol tax.—ED.]

Despatch Riders as Infantrymen.

Sir,—I have been an ardent motor cyclist for the past eight years, during which time I have been a regular reader of your valuable paper. I enlisted as signaller and motor cycle despatch carrier with one of the regiments of the Australian Expeditionary Force. We at first thought we were bound for France, but, of course, as "Jacko" the Turk came in and had too much to say, we had to come here and entertain him. The nature of the country on the Gallipoli Peninsula not being suitable for mounted troops or motor cycles, we have left our beloved mounts behind and volunteered as infantry, as, after all, we left Australia to fight for King and Country and not to choose for ourselves.

Now, Mr. Editor, as I have read your paper for so long and miss its news so much, would you be good enough to post me a few copies as soon as it is convenient?

SIGNALLER C. VANTIN.
Australian Expeditionary Force, Gallipoli.

[Signaller Vantin's request has already received our attention.—ED.]

Signaller C. Vantin (3½ h.p. Douglas), who joined one of the Australian regiments now in the Dardanelles, as a despatch rider, and subsequently volunteered to go into the trenches. The photograph was taken in Cairo. See letter on this page.

A Capable Youthful Motor Cyclist.

Sir,—I have a son who, though only fourteen years of age, is a competent motor cyclist. His mount is a 6-8 h.p. J.A.P., to which is coupled a tandem sidecar. He has recently driven a gentleman and his family to Bournemouth on a two

A youthful motor cyclist, who, though only fourteen years of age, makes long runs daily on the 8 h.p. J.A.P.-engined N.L.G. sidecar outfit shown. See letter on this page from Mr. F. Driscoll.

weeks' tour, and while there did an average of 100 miles per day. The gentleman was so amazed at the youthful driver that he was almost afraid to start out, but on his return he expressed his delight and astonishment at the able manner in which my son had manipulated the heavy outfit.

The gentleman who was recently taken on the tour is prepared to offer a silver cup to any person of the same age driving a machine of the same power carrying the same weight and number of passengers from London to Bournemouth.

F. DRISCOLL.

Mind and Machine.

Sir,—I have forestalled some of the objections to the psycho-mechanical theory in Mr. McClelland's delightful letter. His argument with regard to those mental processes in which the original suggestion is unconsciously received is made good use of, but does not in any way affect the theory under discussion. The suggestion need not originate from an inanimate source or from some absolutely extraneous circumstance; on the contrary, it is much more likely to be transmitted from a sentient origin, between which and the receiving mind a psychic connection has been established. At the same time, I admit that suggestion of this kind may be received from an inanimate agent.

Mr. McClelland in one paragraph refers to "the cry of the slipping clutch," as a psychological statement, and in another as a poetical metaphor. This is distinctly evasive. I can assure him that I have no wish to obscure my reasoning by sentimentality of any kind.

The psycho-mechanical theory rests on this proposition: That all vitality and all consciousness being produced by motion, and obeying the laws of motion in their continuance, a reciprocal and sympathetic relation may exist between the human consciousness and any piece of mechanism with which it is associated, the motion of the machine being sensitised by the corresponding psychic motion of the mind. It is obvious that, if the machine were in itself a thing possessing sentience and will, it would be capable of spontaneous motion—a state of affairs too appalling to contemplate, even in theory. But the existence of a psychic relation between mind and machine is almost a demonstrable fact.

C. E. VULLIAMY.

Castor Oil.

Sir,—I have come to the conclusion that castor oil is one of the best motor lubricants one can use. It appears to possess greater viscosity, which is less affected by heat than the average lubricant, mainly composed of the heavy paraffins (mineral oil).

I have a two-stroke Levis, with automatic lubrication. On experimenting with undiluted castor oil I found it too thick and viscous to flow readily down the cylinder feed, although when I got some down the result was excellent.

Unfortunately, castor oil is not miscible with the ordinary lubricants of the mineral type, so I am unable to thin it in this way. Is there any objection to using about 20% of kerosene? I find on experiment that castor oil will take up into solution this amount, the resulting oil being one which would flow down the lubricating pipes, and the presence of the kerosene would prevent the freezing of the castor oil in winter.

I should like to take the opportunity of saying how useful I find the various articles and "tips" contained in *The Motor Cycle*, including the replies to correspondents.

H. E. WOOSTER.

Changing from Benzol to Petrol: A Warning.

Sir,—I had an interesting experience last week-end. I have for many months used benzole, but now it cannot be obtained, and I had to fill up with petrol. Being desirous of going into Wales from Liverpool over a little fresh road, I took my sidecar outfit *viâ* Birkenhead, Hope, and to the top of the mountains, to the cross roads that run from Llangollen to Ruthin, turning left and going down to Llangollen. Before starting I looked into my tank of petrol, and thought that there was enough for fifty to sixty miles, and as I was only going about forty-five miles concluded I should have sufficient. But I forgot it was petrol, *not* benzole. As we climbed the last stretch and reached the level on the top of the mountains, the engine stopped. Investigation showed an empty tank, and nearly fifteen miles to travel. Benzole would have covered it easily. Luckily, we were high up, and were able to free-wheel with clutch out down to the canal at Llangollen, though this meant pushing the machine half a mile along a flat road into the town.

The experience is simply a warning that motors that would run between seventy and eighty miles on a gallon of benzole will only do sixty on petrol.

J.E.

A Lady and her Motor Cycle.

Sir,—I enclose a photograph of myself and machine. I find the Levis splendid and quite suitable; I can start easily by paddling off. The man's machine is more rigid, and not so unwieldy as most ladies' machines. I have wide and rather low handle-bars; these give me a most comfortable riding position, and with them tramlines, traffic, and grease never worry me.

MABEL BASTOCK.

Miss Mabel Bastock on her Levis (see accompanying letter).

ENGINE RATTLE IN TWO-STROKES.

A Reader's Experiences and Suggestions.

I HAVE followed the correspondence *re* engine rattle in two-strokes with the utmost interest. The explanations of cures by various riders differ so greatly, I was inclined to think that, as "Ixion" seems to suggest, the phenomenon was simply the equivalent of "knocking" or "konking" in four-strokes. I was, on the whole, rather inclined to blame the plug points for this, considering that they (or it, rather, as single-point plugs are a *sine quâ non* with two-strokes) became incandescent much more readily than is the case in four-strokes, owing to the much greater amount of heat generated, a proof of this, to my mind, being that a very thick electrode undoubtedly gives the best results, there being less tendency for such to get red-hot than would be the case with a thin one. I even theorised so far as to assume that the rather rapid wear of connecting rod bearings alleged for two-strokes was an outcome of this rattle, or knock, it being naturally twice as rapid as in a four-stroke, and therefore sounding more like a rattle than the familiar knock. The shock to which the bearings would be subjected at high engine speeds, when plug pre-ignition engendered this rattle or knock, would mean their much more rapid wear, seeing that not only was it a sort of "double knock," but that it occurred with greater frequency than in the case of four-strokes.

This theory of mine was apparently borne out by the fact that when I received my machine (a Junior Triumph) about a year ago it had a four-point plug, with, of course, smaller electrodes than is the case with the best single-point specimens. At high speed after some distance a rattle commenced, which increased to an alarming extent if the throttle were opened any further, the handle-bars vibrating till they absolutely *stung* my hands, but which diminished, and finally disappeared, with less throttle.

This rattle was much more pronounced than it ever has been since I substituted a single-point plug with a good thick electrode. (I notice the Triumph Co. now adopts a single-point plug for this engine.) Furthermore, the machine was new; the engine had just about been run in, and therefore carbon deposit could not have been the cause.

Two Curious Stoppages.

That great heat was directly or indirectly responsible for this "rattle" was proved, to my mind, by the fact that once, after driving the machine fairly hard for some distance, after stopping to cool the engine, and on attempting to restart by raising the compression release valve, the compression was *not* released; and on looking for the cause I found that the solder by which the nipple was attached to the end of the Bowden wire controlling the valve had melted away until not a trace was left upon the wire, only a few "splashes" of solder adhering to the front of the cylinder fins remaining to tell the tale. I easily effected a start, however, by opening the valve with my thumb, a thing which is perfectly feasible while straddling off with the low gear engaged. I may add that since getting the single-point plug this mishap has not recurred. But regularly thereafter the rattle would become apparent at speeds of 27 m.p.h. or more (though not so pronounced perhaps), and at about 1,500 mileage the engine, not having been cleaned or attended to in any way since the start, suddenly stopped during a run.

Taking out the plug to see if it were sooted (as had often happened with the four-point plug), I found nothing wrong with it, and by the time I screwed it in again the engine went off as well as ever. After some further mileage the same thing again happened, the plug also being all right this time. (I may say that I have only experienced sooting of this plug once in over 3,000 miles use, and this was when the engine had been run exceedingly slowly for some distance.) Finally, at 1,667 miles exactly, I had the engine taken down to be cleaned. This, according to the makers' instructions, should have been done at about 1,000 miles, so I had no reason to complain of the two involuntary stops at over 1,500 miles distance. The carbon deposit was not very excessive, however, although a greater proportion of oil to petrol than usual, viz., one to twelve instead of one to sixteen, is adopted in this engine (petroil lubrication). The upper piston ring was stuck in its groove at the exhaust port side (the usual experience with two-strokes), and the big end bearings required taking up. I communicated with the makers, who treated me more than well, and who advised the use of a pure mineral oil to minimise the tendency of the upper ring to stick. This I have not tried so far, as my stock of "compound" oil was so large that I have not yet come to the end of it. The peculiar thing is that, though using the same proportion of oil to petrol as before (and always being very exact about the measurement), the second time that the engine needed cleaning occurred at an interval of 1,093 miles from the first (or about what the makers advise).

An Unexplained Cure.

The symptoms were engine rattle at lower speeds than previously, and slowing down when driven up to 25 m.p.h. The only way I could prevent the engine stopping was to throttle well down, thus cooling it somewhat, when the rattle at once stopped, and in a minute I was again able to open the throttle moderately. Again, there was not a very great amount of deposit, but the top piston ring was stuck as before, though this time the bearings were all right. Since the second overhaul I have ridden nearly 850 miles (or 3,600 in all), and everything seems right. Fairly recently, however, rattle became slightly apparent, either when the engine was driven rather faster than usual (I do town riding every day) or when hill-climbing—in other words, when it had "work to do." Then on a ride of over 100 miles I noticed that for the first five or ten miles distance the engine rattle occurred every time I endeavoured to drive at over 25 m.p.h., and sometimes when climbing hills on top gear.

After the first five or ten miles of this ride, however, and without the engine having even been stopped, no rattle whatever occurred during the whole ninety miles or so, although the machine was driven at 27 or 28 m.p.h., and even 30 for some distance occasionally; sometimes 35 having been reached and kept up for a minute or so, and 37 being once attained. Then a day or two later I again had a ride of about the same distance, and during the whole time no engine rattle whatever occurred, nor has it done so on any occasion since (and that is a fortnight ago, or 300 miles back).

Now this last experience of mine goes so dead against every possible explanation that I can conceive that I am constrained at last to give my experience in your columns to make the problem even more difficult than it was before! No solution has been given by any rider which would meet this case of mine. Nothing was done to the engine: the same petrol (Shell or Pratt's No. 2) and the same oil (Price's Motorine C) were used, in the same proportion, and the same plug was in the engine all the time. Yet when the engine and plug should have been getting hotter, the rattle stopped (and has ceased altogether since, under every condition of driving). Furthermore, the day was hot—by a long way the hottest we had had this year—yet on previous days, at comparatively moderate speeds, and for short distances, the rattle occurred!

Plug Position.

I am curious to know if any rider has found that radiating devices, such as the Harcourt and Koolah, have diminished this elusive engine rattle; also, incidentally, if they decrease the tendency for the upper piston ring to stick. Another thing that I wonder is if the sparking plug in two-strokes were placed vertically in the cylinder head instead of horizontally behind the cylinder, as is usual, would it have a better chance of radiating its heat when the machine was travelling fast? As it is now, the heated air from the cylinder flanges actually converges upon the exterior portion of the plug—and how much greater heat there is than with a four-stroke (which usually, by the way, has its plug in the position I advocate). Of course a four-stroke plug is situated in the inlet valve pocket, and is thus comparatively screened from oil, whereas in the two-stroke it might be argued that it would possibly get more oil thrown upon it in a vertical than it does in its present horizontal position.

OILE.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Drilling the Pistons.

Referring to the article in your paper of May 6th, 1915, "Tuning a Standard Machine," I have just purchased an American 1915 three-speed Excelsior. I shall be obliged if you will tell me if drilling the pistons will not upset the balance of the engine? If not, I would like to drill mine a little, but not nearly so much as shown in the illustration. To get more speed and better lubrication, would you advise me to drill the pistons? As it is, the machine runs perfectly, and has a marvellous acceleration, and I am very well pleased with it.—K.E. (Calcutta).

If the machine is running well, accelerates well, and you are pleased with it, we should not advise you to drill the pistons, as you might upset the balance slightly, and also cause a slight amount of extra carbon deposit on the combustion head. Doubtless you might improve the running a little, but you would get this improvement at the expense of other things.

An Oil Leak.

(1.) I have a 1915 6 h.p. twin-cylinder machine, and lately oil has exuded from the front cylinder, apparently from a point near the lowest flange. I have taken the cylinder off and examined it carefully, and poured paraffin round the flanges, but cannot detect any leakage. I have also run the machine in a dark room so as to see any sign of flame, etc., but with no result. What could this be? It is most puzzling, and apparently the leakage is not from the valves. Even during a short run of three or four miles oil comes out. (2.) The roads in winter in this district (Edenderry, King's County) are full of stones, and I thought of fitting a combination rubber and steel-studded 650×65 mm. tyre. Would this be the most suitable tyre, or an all-rubber of the same size? (3.) Is Price's hub lubricant suited for Renold chains? I find it seems to keep the chains more greasy and is more lasting than oil.—H.S.M.P.

(1.) We can only think that there is a tiny blow-hole through which the oil exudes. You have tried the ordinary tests, and you must now submit the cylinder to a high pressure water test in the manner some makers test their cylinders. (2.) Either of the two types of tyres mentioned would be suitable. (3.) The lubricant referred to would do, but we think you would find a little graphite grease to be better.

Advice to a Two-stroke Rider.

I am a beginner, having only just bought a lightweight two-stroke. I had previously read a good deal about the various parts of the motor bicycle and their use. I am able to ride fairly well, provided everything is in good order, and so far have had no serious trouble. I am a solo rider, and do not have the advantages of club membership, and only very gradually find out that there are many little tips one would like to know. (1.) Why does the engine occasionally four-stroke? (2.) Why does it not always start easily? (3.) What are the correct positions of levers in going downhill? (4.) Should throttle be closed in rounding corners, or is it better to raise the exhaust? (5.) What would help me to use the oil pump correctly? The makers state one charge every four or five miles. I have no cyclometer, and seldom see one on other machines. (6.) Are there other remedies than shortening for a slipping belt? (7.) What is the proper method of taking off and putting the belt on the pulleys? (8.) When should the magneto and magneto chain be oiled, and what oil should I use for this purpose? —E.J.W.

(1.) All two-stroke engines are liable to "four-stroke," especially at slow speeds, due to bad scavenging. (2.) Easy starting is obtained by giving a strong mixture and a small quantity thereof. Open the throttle half-way, see that the air is closed, and have the spark fairly well advanced, when the machine should start easily. (3.) When going downhill close the throttle and raise the exhaust. (4.) When rounding a corner close the throttle. (5.) As regards lubrication, we should advise you to follow the makers' instructions. We should recommend you to have a speedometer, which would also give you the distance travelled, so that you could check your petrol consumption, lubrication, etc. (6.) The only remedy for a slipping belt, if it is a rubber one, is to shorten it. (7.) To take off the belt, pull it away from the bottom of the belt rim, and wheel the machine forwards. (8.) You may lubricate the magneto with engine oil, also the magneto chain. You will get some useful information from "Motor Cycles and How to Manage Them," "Tracing Troubles," and "Hints and Tips for Motor Cyclists."

Private Johnson (Morgan) starting in the "any type of machine class" at the Army and Navy hill-climb reported in our last issue.

Decarbonising.

(1.) Which method of decarbonising would you recommend to a rider who is not anxious to take down his engine? (2.) My machine, a 2 h.p. lightweight, will not do more than 30 m.p.h.; the makers claim 45 m.p.h. The valve timing is all right, whilst the magneto points break the instant the piston reaches the top of its stroke. The ignition is fixed. Should it be further advanced, and, if so, how can this be done? The top gear is 6 to 1. —P.D.A.

(1.) The only satisfactory method of cleaning the cylinder and piston without dismantling is by burning with oxygen, but even this is not as satisfactory as taking the engine down and cleaning it out, as this way you are able to clean behind the rings and inside the piston. (2.) Thirty miles per hour is very good with a small machine, and a 6 to 1 gear is very low for speeds in excess of 30 m.p.h. You would probably find that by advancing the magneto timing slightly, allowing the points to separate when the piston is about one-sixteenth of an inch from the top of the stroke, you would improve the speed, but the machine would not run so well at slow speeds, and would be more difficult to start. To advance the ignition, you will have to slacken the nut securing the sprocket to the armature-shaft, loosen the wheel on the taper, then turn the magneto armature to the desired position, taking care not to move the engine, then tighten the nut again.

Two-stroke Lubrication.

(1.) I have recently fitted an Everest carburetter to my Villiers two-stroke. This uses considerably less petrol than the carburetter previously fitted, so should I mix more oil with the petrol? The engine seems to get sufficient oil. (2.) Should I be wise to fit a Knight lubricator in place of petroil lubrication?—F.J.W.M.

(1.) It is not necessary to give more oil; also, if you increase the proportion of oil to petrol unduly you will experience difficulty in the mixture refusing to flow through the carburetter, as it will be too thick. (2.) We personally like the idea of a separate lubricator.

Too Bright Head Lights.

I was summoned recently in London for driving a cycle car with too powerful head lights. In addition to being fined, my licence (so far a clean one) was endorsed. As this is not an offence under the Motor Car Act, was the court within its rights in doing this, and must the endorsement remain? There was no other charge against me.—S.K.S.

Unfortunately, the Bench was quite in order in endorsing your licence. A similar case was recently brought to the Court of Appeal and lost. Also, we are afraid that the endorsement must remain on your licence so long as you hold one.

Excessive Petrol Consumption.

I have a new 2¾ h.p. motor cycle, which I have ridden just 200 miles. The petrol consumed is 4½ gallons, which, of course, is excessive. Can you tell me how to cut this down?—A.L.M.

The consumption is far too high for so small an engine. See that the right size jet is fitted, and the level of the spirit just below the top of the jet orifice. A good deal of petrol is often lost through waste in filling the tank too full, when a great deal escapes through the filler cap, also through leaky petrol unions, and owing to a flooding carburetter. Look carefully, therefore, to these points, and give plenty of air when driving.

A Cracked Induction Pipe.

I have a 7 h.p. F.N. and sidecar. On two occasions—several months intervening between—both when riding at night after considerable mileage during the day, the first two cylinders, counting from the front, have become red hot, the No. 2 cylinder especially. The fact of a plentiful supply of oil has saved the engine from seizing up. In the first instance I traced the trouble to a fracture in the induction pipe, and when this was bound up with insulation tape everything went well until the present occasion. In this instance the engine was firing well up to about 120 miles, when it became very irregular in its running. I imagine only two cylinders were working, and the remainder of the journey back home (about sixty-seven miles) was accomplished with this irregular firing unless the middle gear was engaged and the engine speeded up, when the firing became more regular, but overheating took place. In starting up from cold I have lately had some difficulty, and on more than one occasion I have been obliged to make a start by pushing off. Do you think the platinum points require attention?—F.G.L.E.

It is very hard to say what is the matter with your machine without actually seeing it. We think you are suffering from further trouble with your cracked induction pipe. The only really effective remedy would be to fit a new one. We should therefore recommend you to get into communication with the makers of the machine. The trouble would account for the difficulty in starting and irregular running. There seems no reason to suppose that your ignition system is out of order, but there would be no harm in overhauling it.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"G.L.S." (B.E.F.)—Junior Triumph. General reliability, hill-climbing, and upkeep.

"C.C.W." (Hertford).—1914 or 1915 three-speed Triumph or Rudge Multi. General efficiency, economy, stability, weatherproofness, and belt wear.

"F.W.W." (Mayo).—Douglas. Cause of blowback through lubricator, resulting in observation glass becoming fouled and obscured.

"L.N." (Kidderminster).—6 or 8 h.p. twin countershaft Zenith. Efficiency and reliability for sidecar work. Weatherproofness, wear on belts, and belt slip on low gears in wet weather.

"S.C." (Ranelagh).—Grado pulley for use with 3¾ h.p. Precision engine for sidecar work. Reliability and belt slip.

RECOMMENDED ROUTES.

COVENTRY TO OLDHAM, avoiding Manchester.—MOTOR CYCLIST.

Coventry, Stonebridge, Coleshill, Lichfield, Abbots Bromley, Uttoxeter, Cheadle, Leek, Buxton, Chapel-en-le-Frith, Glossop, Stalybridge, Ashton, Oldham.

READING TO KING'S LYNN.—S.H.G.

Reading, Twyford, Maidenhead, Beaconsfield, Amersham, Chesham, Tring, Dunstable, Luton, Hitchin, Baldock, Royston, Cambridge, Ely, Downham Market, King's Lynn. Approximately 132 miles.

WORKSOP TO BLACKPOOL.—C.P.

Worksop, Staveley, Chesterfield, Baslow, Bakewell, Buxton, Macclesfield, Knutsford, Warrington, Wigan, Preston, Kirkham, Blackpool. Approximately 115 miles.

ARMY AND NAVY OPEN HILL-CLIMB.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to _____ & Co. ILIFFE & SONS Ltd., and crossed _____

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade Labour Exchange, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

1914 3½h.p. Lea-Francis and Henderson light sidecar; £54.—T. Jerrison, "Moscar," Millhouses, Sheffield. [X9237

LEA-FRANCIS, 1914, 3½h.p. twin, 2-speed, hand clutch, splendid order; £49/10.—Elce and Co., 15, Bishopsgate Av., Camomile St., E.C. [0491

LEA-FRANCIS, 3½h.p., countershaft 2-speed, kick starter, enclosed chain transmission, Jones speedometer, Lucas lamp and horn, in splendid condition; £46.—Hucklebridge, 133, Sloane St., London. [X9162

Levis.

LEVIS, 1915, 2-stroke, as new; £22 cash.—11, Lane Rd., Thornton Heath. [3595

BROOK, Motor Cycle Specialist, Burnham, Som., can supply from stock No. 1 model Levis. [3602

LEVIS New 1915 Models, 2¼h.p. Popular, delivery from stock; £28/1 cash, or easy terms.—Wanchope's, 9, Shoe Lane, London. [X9131

1915 Levis, 2¼h.p., Popular model, absolutely in stock; £28/1; exchanges; easy terms.—Julian, Broad St., Reading. 'Phone: 1024. [X6410

LEVIS 1915 Popular Model, just arrived from works; immediate delivery; £28/1.—Wilkins, Simpson, and Co., 11, Hammersmith Rd., London. [3667

LEVIS, Baby, carefully kept, good tyres, lamp, footboards, Stewart speedometer, Lycett's saddle; £28.—Simpson, 1, Peahen Buildings, St. Albans. [3817

1915 Levis Popular, purchased in May, in perfect condition, new Miller lamp, horn, accessories, tip-top bargain, £19/10.—Wood, 69, Waterloo Rd., Hallington, Crewe. [X9039

LEVIS 2-stroke Motor Cycles, latest 1915 models.—Sole London and district agents, Cars and Motor Sundries, Ltd., 175-177, Shaftesbury Av., London, W.C. 'Phone: 1432 Regent. [0711

LEVIS No. 1 in stock, £36/17, or £10/13/9 down and 12 payments £2/6/8; special discount for 3, 6, or 9 instalments.—Lamb's, 151, High St., Walthamstow. Depot 50, High Rd., Wood Green. [3734

Lincoln-Elk.

1913 Lincoln-Elk, 3½h.p., 2-speed, free engine, good condition; £25.—Mason, 60, South St., Doncaster. [X8974

1912 Lincoln-Elk, 3½h.p., Bosch, Dunlop belt, good tyres, splendid condition; £15.—Cpl. Smith, 4, Bungalow, Batchelor Village, Cove, Farnborough, Hants. [3738

L.M.C.

1913 4h.p. L.M.C. and Coach Sidecar, 2-speed gear, free engine, decompressor, drip feed oiler, in good order; bargain, £35.—75, Osborne Rd., Forest Gate. [3760

Matchless.

MATCHLESS Combination, 8h.p., 2-speed, twin drive; nearest £50.—49, England's Lane, Hampstead. [3961

MATCHLESS Combination, 8h.p., good condition running order; £40.—25, Upper Kennington Lane, S.E. [3605

MATCHLESS, 1912, 3½h.p., single, J.A.P., B. and B., clutch; £22.—Rutter, 140, Tenison Rd., Cambridge. [X9052

1912 Matchless, 3½h.p. J.A.P. engine, fixed, good condition, just overhauled; £20, offers.—Hollings Downs, Bromyard, Worcester. [X9253

MATCHLESS, 1914, 6h.p., Canoelet sidecar, fully equipped, good condition; £65, or near offer.—Mills, 14, Kirkside Rd., Blackheath. [3615

MATCHLESS, 4h.p. J.A.P., 1915 cylinder and piston specially built, perfect condition, fast and reliable; £33.—Ross, 39, Holly Hill Rd., Erith. [X9083

MATCHLESS 1914 8B Combination, in new condition, not been on the road this year; bargain £75.—40, Marmion Rd., Clapham Common. (D) [393

MATCHLESS-J.A.P., 4h.p., P.M. 2-speed, free engine, chain drive, with torpedo sidecar, and accessories; £30.—185, Shernhall St., Walthamstow. [359

Two-stroke or Four-stroke?

AT the moment the two-stroke engine may be said to be at the height of its popularity. Though one of the oldest types of engines, it was not until recent years that engineers in any number devoted their attention to perfecting the two-stroke engine for motor cycle use, and, as we all know, the result has been the advent of the lightweight in its thousands. Lightweights there have been in plenty since motor cycles came into being; indeed, the original motor bicycles were lightweights, though, sorry to relate, inefficient ones. Their main troubles, too, were such that their four-stroke engines, with their miniature valves, could not retain their efficiency for any length of time, which brought into use the common expression "L.P.A.," signifying "light pedal assistance," more often the reverse of light. The valveless engine was seized upon when once its capabilities had been proved, as it eliminated the one weak point of the forerunners of lightweight motor cycles, *i.e.*, the poppet valves; but even now that the best brains have been expended on the development of the two-stroke engine, it is still found wanting in certain respects—for example, internal and external cleanliness—and any thinking man is bound to wonder what may be the ultimate development of the type.

It is well-known to two-stroke users that the excessive carbon deposit which forms so readily in a two-stroke is its greatest drawback. This carbon does not confine itself to the piston head, and the interior of the piston, but causes the top ring to stick in its groove, thus quickly lessening its power output and necessitating frequent removals of the cylinder. This problem has puzzled engineers for a long time past, as also the difficulty which has been discussed at length in our pages, viz., the metallic rattle that is set up in certain types of engines. This rattle does not seem to apply to every make of two-stroke, just as the excessive carbon deposit is not so pronounced in some designs as in others, but nevertheless the two phenomena which have caused engineers "furiously to think" for some months past, are causing them to reflect that after all the miniature four-stroke engine in its very latest form may still prove a rival to the two-stroke. Incidentally the modern highly efficient four-stroke with its practically unbreakable valves is infinitely superior to the lightweight engines of bygone days. We have even heard of one or two manufacturers who, having come to the limit of their patience in the matter of perfecting the two-stroke, are now disposed to change over to the four-stroke. At the moment, the trend of development would suggest that the cheapest and lightest motor bicycle of the future will have a two-stroke engine, whilst the four-stroke lightweight, so far from being ousted by its simpler rival, will continue to grow in popularity. Personally, as our readers know, we have always favoured the two-stroke for lightweight machines, this simple valveless engine lending itself splendidly to this purpose, and being so much in keeping with the light motor bicycle selling at a popular price.

Further, the experience which makers have had with the two-stroke is short compared to that with the four-stroke, and we are convinced that there is still much field for research and experiment, and are strongly of opinion that the troubles we have named are not insuperable. We should not like our readers to get an exaggerated idea of the importance of these failings. Indeed, it is only the engineer and the designer, or the mechanically-minded user who worries himself unduly concerning them. The average potterer, who forms the larger part of the ranks of two-stroke users, does not find these difficulties a real drawback to the two-stroke; a little erratic running immediately after starting, an objectionable spluttering on occasion, and the frequency of cylinder removals, and extravagance in petrol and oil consumption being all that concern him.

An Index to the advertisements in this issue will be found on the page facing the back cover.

MILITARY NOTES.

SWIVELLING HEAD LIGHTS.

THE General Officer commanding the Third Army C.F., who is the competent military authority for all Essex outside the Metropolitan police area, all Herts. outside the Metropolitan police district, and the whole of Buckinghamshire, points out that prosecutions have been very frequent under the Defence of the Realm Regulations (1914), especially in the case of motor cyclists. This is a regulation affecting the use of lamps capable of movement independent of the vehicles to which they are attached. He considers that these contraventions are probably owing in many cases to ignorance. We are engaged in a serious war, and it hardly seems reasonable to criticise the action of the military authorities, but we cannot help feeling that this particular regulation is one which was made without considering the motor cyclist in the slightest degree. Having made it, the authorities will not go back, and will offer no suggestion as to a means of fixing a motor cycle head light. If the head lamp is fixed so that it cannot be moved vertically, there is no regulation to prevent a man taking off the lamp and waving it in the air, or otherwise using it for signalling.

THE SUPREME TEST.

"A CONVOY which has no trouble with its vehicles does some good out here to the makers. You have got no idea the battering about the cars and motor cycles get on these roads. It's just awful, and to keep them up to the work requires the greatest possible knowledge of their parts."—Extract from a letter received from Lieut. T. E. B. Chalmers, who is workshop officer to an ambulance convoy in France.

The convoy consists of fifty Daimler ambulances, one Daimler 30 cwt. lorry, three Peerless 3 tonners, four Sunbeam cars, and seven Triumphs.

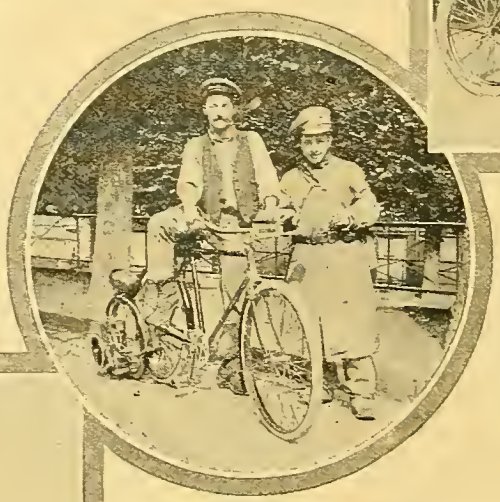
Lieut. Chalmers was formerly a well-known Birmingham tradesman by reason of his connection with the Jennings-Chalmers light car. He will probably be better known to our readers, especially those in Scotland, as a competition rider of a big twin Bat.

A WELL-KNOWN RIDER KILLED.

WE regret to learn that Pte. L. W. Spencer, Motor Cycle Orderly, G. Co., 13th Kensington Battalion, County of London Regiment, has died in hospital in France after being shot in the head whilst on duty.

L. W. Spencer was at one time running the Little Giant motor bicycle at Uxbridge. He was, to the best of our knowledge, the only British motor cyclist to make a motor cycle tour in Iceland. He also contributed to this journal an account of a tour in Devonshire, and was the first motor cyclist to climb Dunkery Beacon and Snowdon on a 3½ h.p. Rover. When our men were suffering so much in the flooded trenches, he wrote to this journal marvelling why Hutchinson boots were not adopted by the Army. Waders were given to the men about the time his letter appeared.

Corporal Frank B. Day, R.E., who has spent two birthdays in France. His mount is a countershaft model Triumph.



A Frenchman riding an Auto-wheel on a pavé road.

Corporal Bevan, R.E., makes a temporary repair to the handle-bars of his Douglas with the aid of a stiff bough from a tree. He had fallen into a hole made by a shell.

A TALE OF A SPECIAL CONSTABLE.

A SOLDIER was out for a spin on his motor cycle and sidecar with his best girl on board, when a special constable stopped him and asked to see his licence. As he did not have this important document on his person he attempted a little bluff, and told the special that he was carrying despatches and must not be detained. "Oh, indeed," replied the special, "that is most interesting. I will write to ——" (mentioning one of his officers) "and tell him what you say. I will also inform him that your despatch on this occasion was a girl in a sidecar." The soldier was obliged to langh and admit that he had been fairly caught, so he then satisfied the curiosity of the energetic special with the least possible delay.

COVENTRY MOTOR CYCLIST KILLED.

IT is only a week or two ago that we referred to Sec.-Lieut. Theo Newsome as frequently being confused with Sec.-Lieut. C. T. Newsome of the Rover Co., both men being prominent motorists of Coventry, and members of the Coventry and Warwickshire Motor Club. We now much regret having to report the death of Mr. Theo Newsome, who was killed in action at the end of last month. Of the thirty-six odd members of the Coventry Club on Active Service, this is the first fatality.

DOUGLAS WAR WORK.

NOT only is the War Office regularly taking batches of the 2¾ h.p. Douglas, but it is also demanding big supplies of 4 h.p. sidecar outfits of the same make, and the French Government has placed an order for this same combination. On top of this we find Messrs. Douglas Brothers are manufacturing a number of shells, and sets are being supplied weekly for Marconi wireless. They make a further set for the Admiralty, which is fitted in transport lorries.

J. H. Slaughter, the old Triumph and L.M.C. rider, is busy testing Mandslay lorries. He told us he would like to compete in a munition workers' competition.

OCCASIONAL COMMENTS.

By "IXION."

The "Dymag."

It's a horrid word, I know, but I suppose the craze for abbreviations will saddle us with this or some similar atrocity. Still, I want to discourse about facts rather than terms. I have now acquired a little experience of the combined lighting-cum-ignition outfits, and I see clearly that one of two things must come to pass. Either a little trouble must be taken to bring them up to the high standard of reliability already attained by the magneto, or else we shall suffer more frequent ignition stoppages. The wiring circuit of a "dymag" is a fearsomely complex affair, and even if its complexities are tolerably easy to keep in working order when once comprehended, by no means every motor cyclist is quick to grasp their significances. To mention but one case in point, they usually include an automatic cut-out, which prevents the battery from exhausting itself into the dymag, when the current output at the dymag terminals is of less voltage than the current at the battery terminals. On the machine in question this cut-out is most ingeniously designed for operation by the suction of the inlet valve. The owner concerned blissfully imagined that the metal pipe connecting his engine with the suction switch was some kind of oil-pipe; in course of time his check valve got a speck of dirt in it, and misfiring set in. The trouble was corrected in a couple of minutes when he twigged its nature, but, needless to say, his diagnosis was long, painful, and hesitating. The trade must consider very solemnly whether the average rider is sufficiently clever to be trusted with circuits so complex. For myself, I think the trade pays the average user too high a compliment in considering him worthy of such outfits.

Those Yankees!

It is interesting to notice that the American manufacturers, from the Hendee Co. downwards, are nibbling at the lightweight. For a long time past the Schickel has been almost the only home-made two-stroke on their market, but there are a lot of *débutantes* in that field this autumn—beg pardon, "this fall," I should say; and precious ugly little beasts some of them are. The big Yankee twin conceals its native ugliness because all the odd corners are filled up with gear of one sort or another, but when they come to house a baby engine in a lonely corner of a half-empty frame, the American's lack of an eye for beauty is sadly obvious. They are making the Wall Auto-wheel under licence, and are boosting it tremendously. In addition there is a 21 lb. 1 h.p. two-stroke attachment for push-bicycles, alleged to be capable of 4,200 r.p.m. under load on the road; I should imagine the load was a postage stamp, and the road was the face of a precipice. A contributor, under the heading "Injecting Pep for Speedwork," speaks of a horizontal twin which can do 3,000 r.p.m. when lying on a bench, without any securing bolts! One firm announces a new baby two-stroke incorporating poppet valves in the head, which is expected to revolutionise the valveless world! One thing is certain, and that is the big American twins are touching a very high standard. Doesn't it make one envious to read of petrol at 14 cents (7d.) a gallon?

The "Tight Spot" in a Chain.

A correspondent writes to question whether the well-known "tight spot" in a chain is really due, as suggested, to any unevenness of wear, and alleges that the tension is unequal even when the machine is brand new. He ascribes it to the fact that sprockets (and especially the larger countershaft sprockets) are finished before they are mounted on their shafts, and that they generally lose their "truth" to a fractional degree during the mounting process. He believes perfectly even tension could be procured if the sprockets were tested and trued after mounting. I regret that I do not possess the shop experience requisite for a verdict on the point, and as it happens, there is no showroom handy on which I can test the truth of a dozen brand new and unused chain drives. If my correspondent is correct, the trade could obviously increase the life of its chains and sprockets very considerably by attending to this detail, and it is possible that the point may partly explain why different riders claim such divergent mileages from a set of chains. Alternatively, the facts, if true, would suggest that heavier sprockets, incapable of being strained in fitting, or a method of fixing which obtains rigidity without forcing, might prove cheaper than a system of re-truing the sprockets after fixing on their shafts.

Side-by-side Valves.

The abandonment of the overhead inlet valve by a firm of such standing as the Indian Co. gives one furiously to think, especially when contrasted with a marked European inclination to push the overhead pattern, whilst overcoming its defects, by encasing the rocker gear. It would be very interesting to have access to the evidence on which two such eminent concerns as the Hendee and the M.A.G. technical staffs have come to diametrically opposite conclusions; and, in my lay ignorance, I am tempted to suggest that the Swiss firm has laid the greater stress on pure technics, and that the Hendee engineers have been tenderly mindful of the average user and his yearning for accessibility. On the one hand, I always feel that an overhead valve engine (even if only the inlet valve be promoted to the upper house) has an extra vim and *élan* which no side-by-side valve engine of equal cubical capacity and workmanship can quite hope to match. Against this factor one must remember that the overhead inlet obstructs access to the exhaust valve; is not too accessible in itself, even when naked; is apt to wear very rapidly so far as its rocker gear is concerned, where no cover is provided; and will shed parts or lose adjustment unless its construction is very solid and weighty; in particular, the replacing of a stout spring on such a valve is "some" job. *Per contra*, the side-by-side type never seems to produce quite the same kick and acceleration, but is infinitely pleasanter to handle in any repair work. I consider the design of M.A.G. engines ideal on the road, but sigh for something simpler when decarbonisation is in the air. So I rather fancy that the Hendee engineers settled the problem with one eye on their myriad customers who ride in rough lands, where time is precious and repairers are few.

ROAD TESTS OF NEW MODELS.

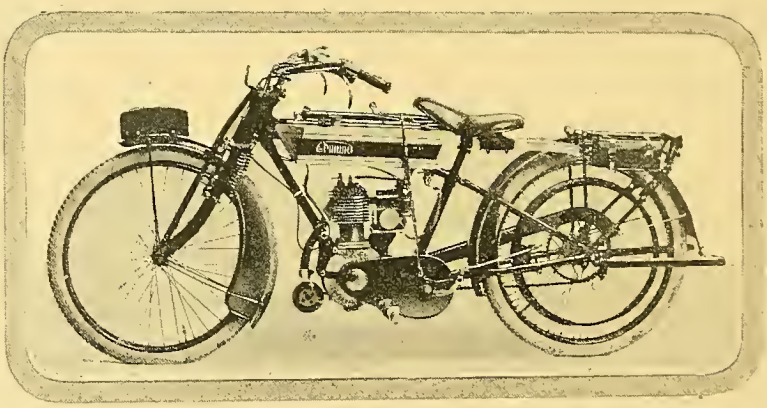
2½ h.p. Spring Frame Edmund-Jap; Bore and Stroke 70 × 76 mm., Cubic Capacity 292 c.c.; Enfield Two-speed Gear and Transmission.

WE recently had the opportunity of putting a machine of the above make to a somewhat extensive test, and since our riding was done over roads which considerably varied in hilliness and quality, we are now able to speak with practical knowledge concerning this interesting lightweight.

The machine is of special interest on account of its springing, and since almost any make of lightweight engine can be adapted to the Edmund spring frame, our interests were centred more on the efficiency of the springing system than on the capabilities of the 2½ h.p. J.A.P. engine, the merits of which are sufficiently well known. In these days of bad roads any adequate system of rear springing for lightweight machines is of special interest to many of our readers, and it cannot be doubted that in due course rear spring frames will become the common order.

Description of the Springing.

Though we have already described the Edmund springing system, a brief outline as to its working points is here necessary. The weight of the rider is supported by two long leaf springs extending from under the saddle to the rear carrier stays. The tension of these springs can be adjusted to suit one's weight by raising or lowering the bolts that support their thin ends, and for this purpose the stays are flattened and several holes are drilled to give the various settings. Short coil springs, which act as shock absorbers, are fitted to the lower ends of the stays. The top bar, which is pivoted at the steering head, moves vertically with the saddle, and the footrests are attached to the extended saddle pillar which passes through the seat tube. Thus it will be seen that the saddle and the footrests move in unison against the tension of the long leaf springs, which insulate the rider from road shock and engine vibration, the portion of the frame which carries the engine and the road wheels being rigid.



The Edmund spring frame motor cycle, our experiences with which are recounted in the accompanying article.

The tank is attached to the top bar, and, since this member is sprung while the engine is unsprung, petrol and oil are conveyed from their respective tanks by flexible petrol-proof rubber tubing as used by the British and French Governments on flying machines. The originality of the frame design also necessitates a divided tank, one compartment of which carries one quart of oil and half a gallon of petrol, while the other carries one gallon of spirit. The convenience of possessing two tanks is fully realised in practical use, though the compartments can be interconnected if desired.

The Comfort Provided.

Extreme simplicity of design is a great point in favour of the Edmund springing system, the few unconventional features involved being obvious at a glance. Many of the roads we negotiated would be hard to equal for their rapid succession of pot-holes, and during the year we have ridden many machines, from the big touring twin down to the two-stroke lightweight, over these same roads. There is no question, however, that the machine under review has proved by far the most comfortable we have handled amidst such conditions, the action of the long springs being so gradual that only the worst of pot-holes conveyed anything resembling a jolt to the rider. Probably the chief point in favour of this system of springing is its absence of sudden recoil when negotiating pot-holes in rapid succession. There is no tendency for the rider to bounce up and down with increasing violence when travelling at speed, the action of the springs being at all times slow and steady—a point we emphasise for the benefit of those who have had no experience with rear sprung frames. Some such arrangement is obviously in demand during this period when lightweights are so much used about our military centres, where the roads are generally of the worst. The carrier is partly sprung, and is more comfortable than the rigid type for pillion riding, but it would add to the general satisfaction of the machine for present-day demands if this portion were sprung with the saddle—an embodiment somewhat difficult to attain.

Engine and General Efficiency.

The 2½ h.p. J.A.P. engine displayed a surprising kick and vigour when opened up to normal speed, and we found the machine slightly faster than most two-strokes we have handled of the same power. The marvellous economy of this little mount is, however, its most surprising feature, the re-filling of the petrol tank being such an occasional event that one is apt to forget it as a practical necessity. The machine is fitted with Amac carburetter and Dixie magneto.

Its hill-climbing capabilities are all that can be desired for normal work. The Enfield gear and transmission is delightful in action, the machine

Road Tests of New Models.—

picking up from a standing start on quite a steep gradient. In no way, therefore, would this little mount fall short of meeting the demands of the ordinary pleasure rider, and yet it is by no means heavy.

There are, however, one or two insignificant points where improvement might possibly be made. The fixed ignition prevents one from obtaining the best out of the engine, and does not improve matters when starting from cold. Like almost every lightweight we have handled this season the footrests are too near the ground. On these little machines, with their safe riding position, one gets into the way of leaning the machine at a considerable angle when negotiating right angle bends, and if the road surface is irregular one is apt to foul the footrests with considerable force during moments of forgetfulness. We would also like to see the chain guards of lightweight machines made of more solid material, so that these members are not so susceptible to injury and the resultant rattle.

USEFUL MOTOR CYCLE FORMULÆ.

Some Aids to Easy Calculations.

MOST motor cyclists who are keen on the pastime, and there are few who are not, find themselves confronted at some time or other by queries relating to the effect of variations of the gear ratio, upon the road speed, the number of engine revolutions per minute being a known quantity, or the effect of variations of engine revolutions upon the road speed, the gear being the known factor, and it is with the idea of providing simple, handy formulæ that the following notes are penned.

The one constant which is required in all calculations of this description is the number of revolutions which the wheel of the cycle makes in travelling one mile, this being arrived at by dividing one mile (one mile = 63360in.) by the circumference of the wheel. In the case of a 26in. wheel the circumference is 81.681in., so that the wheel will make $\frac{63360}{81.681}$, which equals 775.69 revolutions to one mile, consequently to find the number of engine revolutions per minute, knowing the miles per hour that the machine is travelling, and the gear ratio, the miles per hour must be multiplied by the constant 775.69 which gives the revolutions of the wheel per hour, this being multiplied by the gear ratio to give the engine revolutions per hour and divided by 60 to give the engine revolutions per minute, thus:

$$\text{Engine revolutions per minute} = \frac{775.69 \times \text{speed in m.p.h.} \times \text{gear ratio}}{60}$$

$$\text{which simplified} = \text{m.p.h.} \times 12.9 \times \text{gear ratio} \quad (1)$$

This formula may, of course, be transposed to give the miles per hour the machine is travelling with known engine revolutions and gear ratio, the formula being then

$$\text{Speed in m.p.h.} = \frac{\text{Engine revs. per min.}}{12.9 \times \text{gear ratio}} \quad (2)$$

A further variation is that required to give the necessary gear ratio to provide a given road speed, the engine revolutions being known, the formula will then become:

$$\text{Gear ratio} = \frac{\text{Engine revs. per min.}}{\text{m.p.h.} \times 12.9} \quad \ldots \quad (3)$$

It often occurs that the cyclist requires to know what speed his machine is travelling when timed in seconds and fractions of a second over a distance measured in yards, and in this case the following will be found useful:

$$\text{Speed in m.p.h.} = \frac{\text{Distance in yards} \times 3{,}600}{\text{Time in secs.} \times 1{,}760}$$

$$\text{which simplified} = \frac{\text{Distance in yards} \times 2.0454}{\text{Time in secs.}} \quad (4)$$

or, having the speed of the machine in miles per hour:

$$\text{Distance in yards} = \frac{\text{Speed in m.p.h.} \times \text{time in secs.}}{2.0454} \quad (5)$$

To find the time in seconds required to cover a given distance at a definite speed:

$$\text{Time in secs.} = \frac{\text{Distance in yards} \times 2.0454}{\text{Speed in m.p.h.}} \quad (6)$$

When using the above formulæ for other than 26in. wheels it will be necessary to substitute the following values for the constant 775.69in. in formulæ (1), (2), and (3).

24in. wheels = 840.35. 28in. wheels = 720.27.

N.B.—No allowance is made for the flattening of the tyre.

H.H.S.

A HAPPY SOLUTION OF THE FAMILY TRANSPORT PROBLEM.

The outfit is a 7 h.p. three-speed Indian, with a double-seated Millford sidecar owned by a French reader resident in Cairo. The owner says it is most comfortable, the two eldest children occupying the forward compartment, while the baby travels with his mother.

NEW MODELS

· MANUFACTURERS' PROGRAMMES FOR 1916 ·

IVY IMPROVEMENTS.

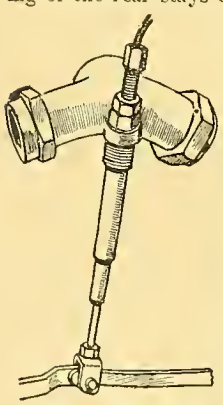
Some Detail Refinements on both Four and Two-stroke Machines.

ALTHOUGH entirely new Ivy models are not being produced by the makers, Messrs. S. A. Newman and Co., for 1916, the present models have undergone certain minor improvements which should render these machines more popular still in the future than in the past.

Foot Brake Design.

As an instance of the changes, the foot brake on the 5 h.p. twin has been redesigned with a very much longer bearing, and is now of somewhat more massive proportions. This brake acts upon the belt rim externally, whereby it is unnecessary ever to disturb the brake shoe before removing the rear wheel for a tyre or cone adjustment. A great number of rear wheel brakes develop play in the bearings and connections because such parts are difficult effectually to lubricate, and are inevitably bathed in mud during a winter run. Consequently, to add to the bearing surface must stiffen the brake as well as making it more durable.

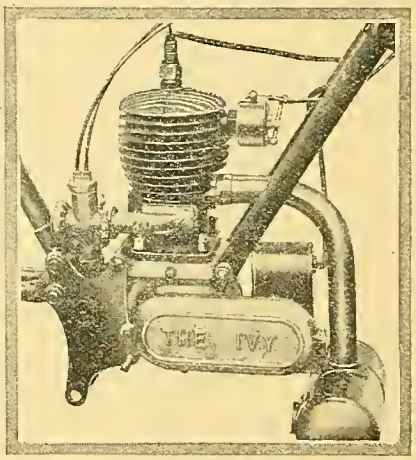
Another improvement is the redesigning of the rear stays to take a very much wider mudguard, which is carried well below the centre of the wheel.



Exhaust lifter with rod attachment from inlet pipe to exhaust valve lifting levers. One of the 1916 improvements on the 4-5 h.p. twin-cylinder Ivy.

All single-geared machines, to which later the owners may require the standard two-speed gear fitted, are sent out with a special U section bottom bracket slotted to receive the gear box securing studs, while a lug brazed to the down tube is ready to carry the gear lever and its brackets—a detail saving expense and time.

A disadvantage sometimes found with the ontside lever exhaust valve lifter when fitted to a twin-cylinder machine is that the lever is apt to develop shake, to rattle, and on occasions to prevent the valves seating accurately. Moreover, the single uncovered Bowden cable being carried from the inlet pipe bracket to the tappet-lifting levers tends to whip, and therefore to fray out until the wire finally parts and the average rider is in a fix. To overcome this the latest Ivy twin is fitted with an exhaust valve lifter operated by a rod from the inlet pipe bracket



Ivy two-stroke engine in position. The location of the compression release silencer will be noted.

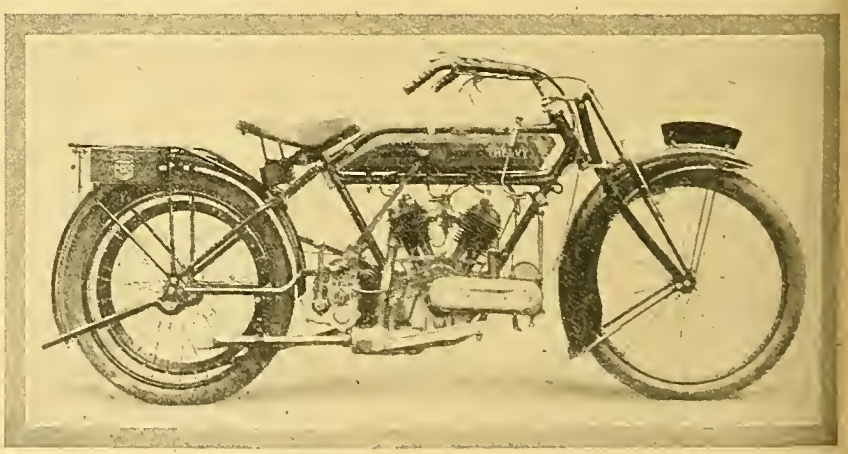
to valve-lifting levers, which rod, being held down by an internal spring, holds the levers stiff. The action is exactly that of the ordinary front wheel rim brake mechanism, and the Bowden cable is used from the handle-bar lever to the inlet pipe bracket where it is secured to the operating rod.

Following modern ideas, the engine chain case is a stiff aluminium casting in two halves bolted together, and therefore able to stand a good deal of rough treatment. The silencer is a steel tube turned on the outside and drawn at each end to form sockets for the forward and outlet exhaust pipes, the rear cylinder discharging straight into the silencer through a short pipe.

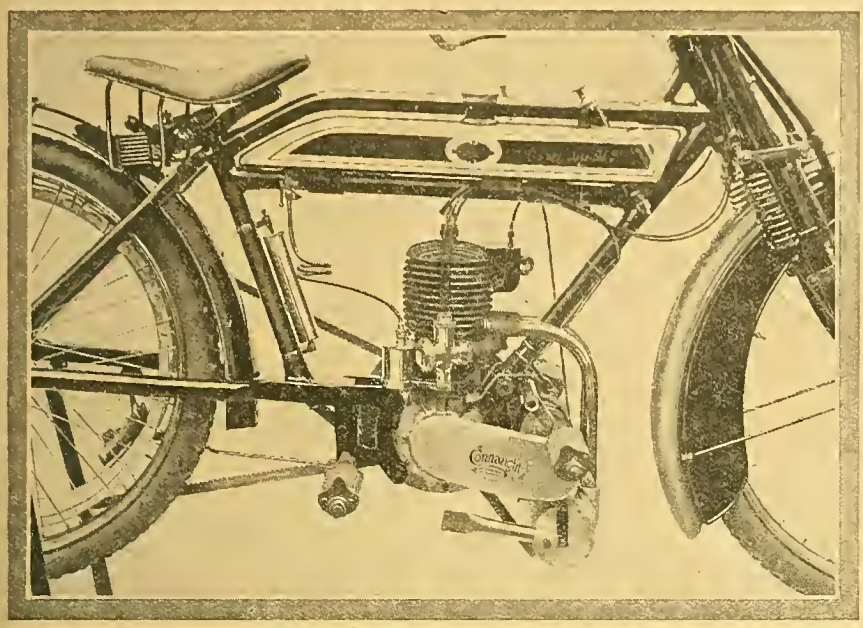
Two-stroke Modifications.

Much useful thought has been expended on the two-stroke model, and as a result it seems probable that all the machines will have an extra air inlet on the induction pipe, as experiments prove that with the present carburetter much power may be gained thereby. On all the compression release valve is fitted with a special silencer, consisting of a cast box enclosing the small mushroom headed valve and allowing the escaping mixture to expand within the casting and afterwards to escape through a few small holes, and in a measure preventing oil spray from being flung all over the machine. Certainly, the casing looks much neater than the bare valve and operating gear; at first the exhaust was taken from this silencer to the exhaust pipe, but latterly small holes were drilled direct in the outer casing itself.

These few details show that S. A. Newman and Co. are anxious to keep ahead, and when competitions recommence it is safe to say that the Ivy often will be found in the premier place once more.



1916 model 4-5 h.p. twin-cylinder Ivy, which is built on distinctly pleasing lines. Chain-cum belt drive is employed in conjunction with a three-speed box.



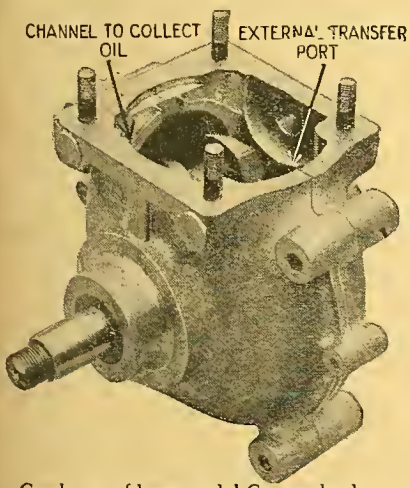
Power unit of the 1916 two-stroke Connaught. This view shows the new tank and other redesigned fittings.

1916 CONNAUGHTS.

Redesigned Cylinder and Piston.

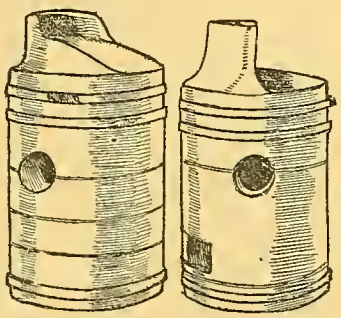
AS 1915 has seen many firms experimenting with circular, or nearly circular tanks, so for 1916 the octagonal or "Zeppelin" tank seems to be gaining favour. The 1916 Connaught tank, enamelled with a vermilion panel in the centre of an aluminium coloured backing, the whole being set off by black lines, is of this type.

This small two-stroke has undergone little alteration so far. The major details redesigned are, firstly, the cylinder,



Crank case of latest model Connaught showing new features of design.

which now has more fins than hitherto, and a transfer passage to the upper row of ports only, but outside the cylinder walls instead of inside, thus deleting the second and lower row of ports inside the cylinder bore, to conduct mixture in the crank case to the combustion space; secondly, an altered crank case, partly as a result of the transfer passage design, and partly to make it more pleasing to the eye.



1916 and 1915 pattern pistons of the Connaught two-stroke compared. There is a separate transfer passage in the latest pattern, thus deleting the piston port.

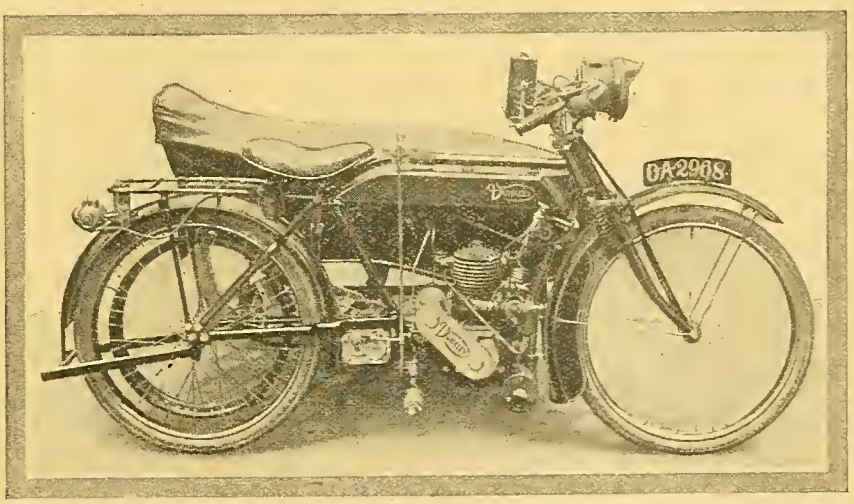
A slightly different piston is now used, having a longer skirt, oil grooves in the waist of the skirt, and a different baffle on the piston head. The piston skirt port is, of course, not required, as the mixture passes outside the cylinder to the ports. With these exceptions, the 1916 Connaught follows the lines of the 1915 model.

DUNKLEY LIGHTWEIGHT SIDECAR OUTFIT.

A Low-priced Sporting Mount for Passenger Work.

AS a result of careful experiment and testing, Messrs. Dunkley, Ltd., have produced a light sidecar outfit for those who require a mount inexpensive in first cost and upkeep. The designer has also had in mind the object of checking as far as possible the efforts of the misguided enthusiast who fits a heavy sidecar to an only-too-willing small two-stroke, thereby ruining for ever the alignment of his machine by using it for a purpose never intended by its designers. The model under review has been improved and strengthened by extra liners in the frame, so that it can withstand the heavy usage or a sidecar.

The engine is the 349 c.c. 75×79 mm. Peco, with a two-speed box, the gears of which are controlled by a horizontal lever placed near the rear of the tank after the Douglas fashion. Lubrication is still by gravity, the oil passing through a drip feed below the level of the tank. The feed is adjustable through a milled disc and locking pawl, and protected by the usual glass-faced casing. Druid front forks are used, and a combined drive is fitted, the engine chain being protected from mud by a shield. Experiments are being carried out with a large Senspray carburetter which may be adopted in the future, but at present



Dunkley lightweight sidecar outfit. The engine is a 349 c.c. Peco, and a two-speed countershaft gear is fitted.

New Models.—

any type specified by the buyer can be fitted. 26×2in. wheels, a 1in. Lyso belt, and a large comfortable pan saddle are included in the specification.

Novel Cushion Design in the Sidecar.

The sidecar is neat, pointed in front, and provided with a large side door, giving easy access, while great care has been taken to stiffen the sidecar mudguard support and to check vibration in the latter—a fruitful cause of unexpected trouble. Sprung at the back and front on large coil compound springs, the body is comfortable to sit in. The cushions are peculiar in that seat and back cushion are in one long piece, divided up into parallel strips about 3in. across, and therefore not liable to flatten, as might happen with a single large cushion. Being in one piece and fastened to the back of the car, it cannot be lost, while the tool box is readily accessible.

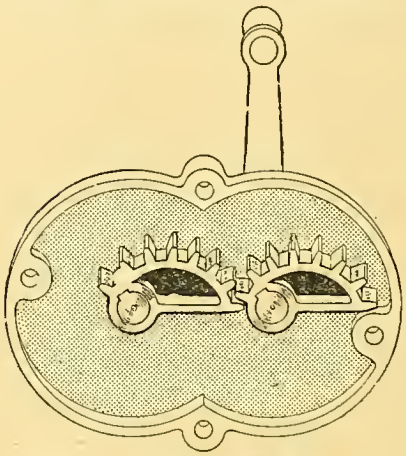
THE P. & M. FOR 1916.

FOR some months past the output of Messrs. Phelon and Moore, Ltd., has been taken up by the Royal Flying Corps, but recently the works have been placed under Government control, and the Union Jack now flies over the premises. Consequently there will be little change in the 1916 model P. and M., though minor improvements are to be made, which will add to the strength and efficiency of the machine. The gear change of the new twin is probably to be altered, a fresh form of change speed lever being adopted, which should add to the pleasure of handling this luxurious mount.

Until these improvements are carried into practice, the machines remain as described some time ago in the articles dealing with the 1915 models that have appeared in *The Motor Cycle*, except that the gear operating chain has been slightly altered.

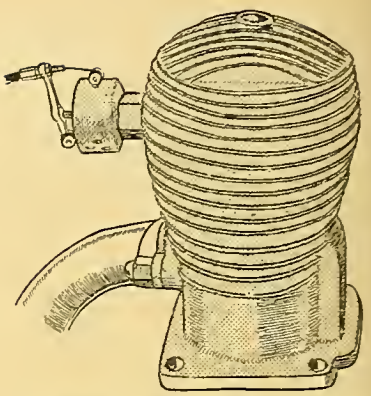
THE C. & S. STARTING GEAR.

AN ingenious form of starting gear has lately been introduced by Messrs. Simpson and Co., 39, Victoria Street, S.W. This is claimed to be an improvement upon the ordinary kick-starter, which is geared up to some extent so that a reasonable number of revolutions may be obtained to one depression of the pedal, and this fact makes it all the harder to cause the engine to turn. Now, the C. and S. starting gear appears to be a considerable improvement,



The C. and S. starting gear, which is described on this page.

as it consists of two gear wheels or segments, the teeth of which are constantly in mesh, and the pitch lines of which form involutes, or other curves, which give each wheel a constantly increasing radius, the arrangement being such that the teeth of the smallest radius of the one gear wheel mesh with the teeth of the largest radius of the other gear wheel, so that when one wheel is revolving and the

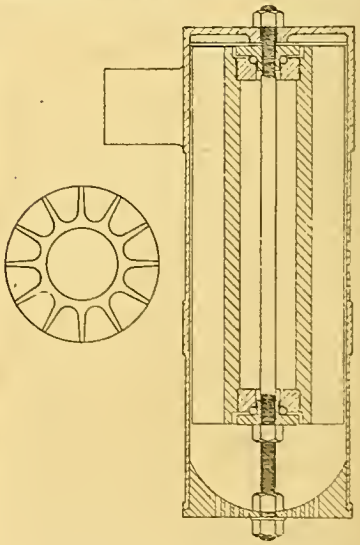


Cylinder of the Ivy two-stroke engine, showing the new compression release silencer fitted to front of cylinder. (See page 368.)

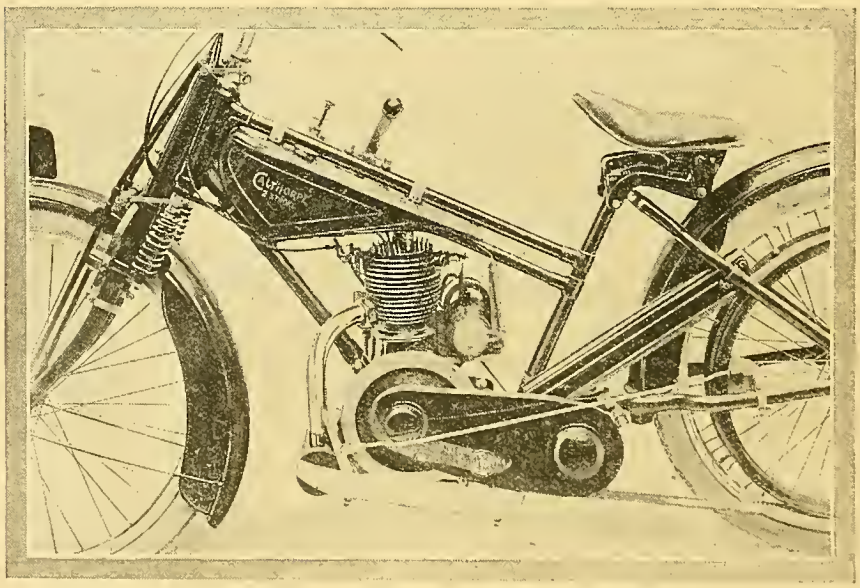
other driving a constantly increasing velocity ratio is obtained between the two shafts upon which the wheels are mounted. The result is that when one begins to start the engine the gear is particularly low, and a good deal of power is obtained at the expenditure of comparatively little force. When once the engine has been started, and the initial inertia overcoce, the gear automatically becomes higher, so that a greater velocity is obtained. We are hoping shortly to see a machine fitted with the device, and shall be very interested to see how it works in practice.

THE MANSFIELD SILENCER

A SKETCH on page 242 of *The Motor Cycle* of September 2nd showed a silencer containing a rotor, the design of Gunner Austin Jones of the M.M.G.S. This has brought forth the fact that a silencer designed on somewhat similar lines was patented by Mr. C. J.



Mansfield, of Prince's Avenue, Alexandra Park, N., also in the early part of 1913. In the Mansfield design (reproduced herewith) a spiral-bladed rotor is used, and it is mounted on ball bearings. The device, it is claimed, is most efficient both as regards silence and absence of back pressure.



A nearer view of the engine and transmission of the lady's Calthorpe, described on page 349 of our last issue. The position of the magneto by which the length of the h.t. wire is reduced to a minimum should be noticed.

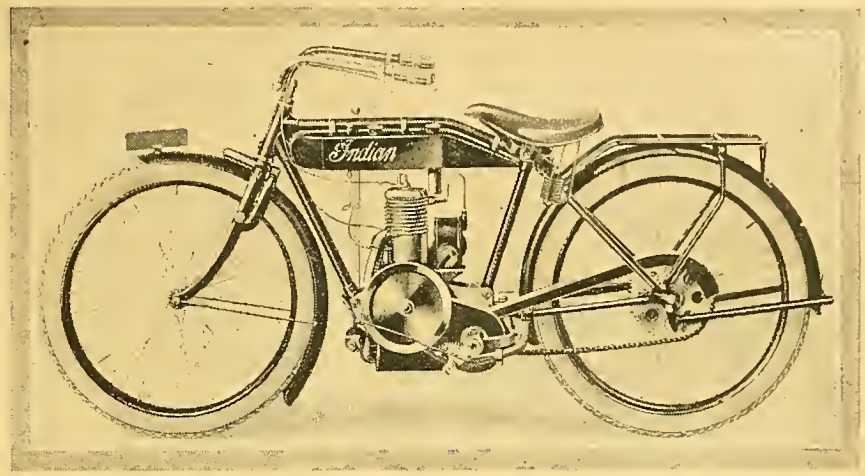
The New Lightweight Indian.

Three-port Two-stroke Engine, 64 mm. × 70 mm., 255 c.c. Re-designed Indian Three-speed Countershaft Gear and Chain Drive.

WE have already outlined the specification of the lightweight Indian, the newest addition to the Indian 1916 range, and are now able to give details of this machine, which is quite a new departure for the Hendee Manufacturing Co. It is by no means a baby, as the engine dimensions are 64 mm. × 70 mm. (255 c.c.), and it is rated at 2½ h.p.

A glance at the sectional photograph of the engine clearly shows its construction, while it is at once evident that the sheltered position of the magneto, carried, as it is, on a neat platform forming a portion of the crank case casting, is a most excellent feature.

This engine should give plenty of power for its size, and render the machine capable of going anywhere. The petroil system of lubrication, which first saw the light in America, a country in which the two-stroke has received considerably more attention than it has in England, has been adopted. (In America two-stroke engines lubricated with the petroil system have been in use for a long time for marine work.)



The 1916 2½ h.p. two-stroke Indian, the specification of which includes a three-speed gear and clutch and chain drive.

The New Three-speed Gear Box.

An excellently designed three-speed gear box, which is to be the new Indian pattern, is bolted to the bottom bracket. This contains a kick-starting device and three-plate clutch, the clutch being of the well-known Indian Raybestos and steel plate type.

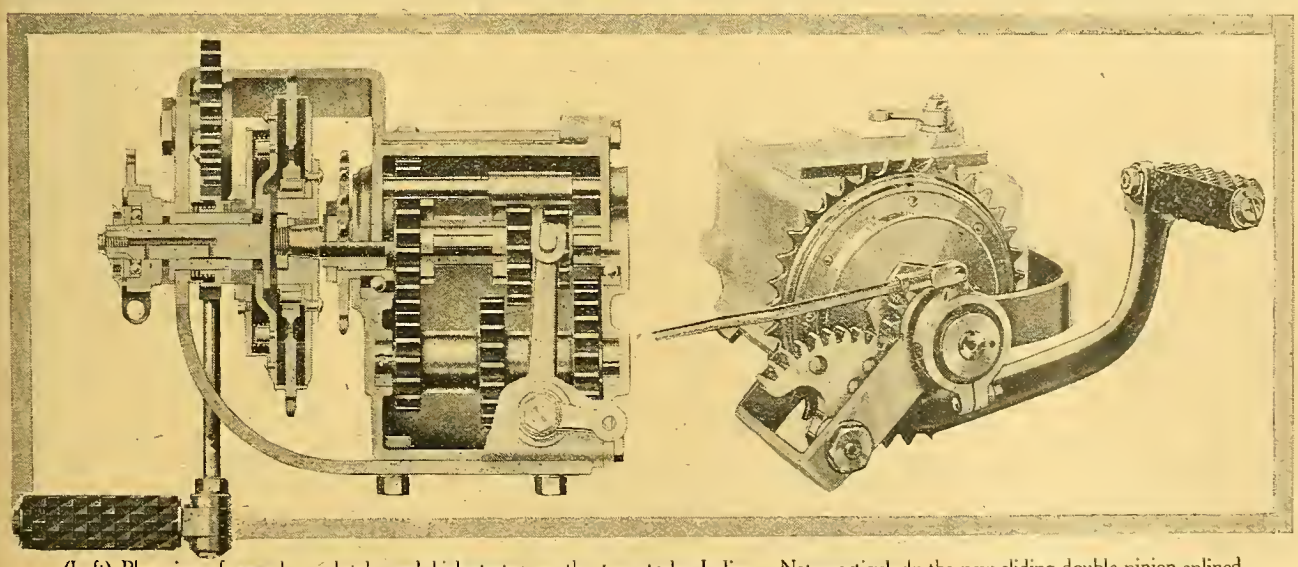
The two lower gears are now operated by means of a sliding double pinion splined to the main shaft. When this is moved to the left it engages the driven sprocket, which is loosely mounted on the main shaft, by means of dogs. Two gear wheels only are then in mesh, and these revolve idly; the other pinions revolve but do not engage. For the lower gears the pinions slide into engagement, and the drive is in each case through two sets of pinions, the third being out of engagement. This makes for quietness in running.

There are few lightweights on the market at the present moment possessing such up-to-date features as a three-speed gear box and friction clutch. The clutch control is either by hand or foot, the long lever shown in the illustration being that which actuates the clutch. The chain conveying the power from the engine to the countershaft is enclosed in a neat case, while a guard protects the rear chain.

The photograph which illustrates the gear box unit shows the substantial construction of the kick-starter as well as the straight bar on the top of the box which engages with a groove on the frame so as to ensure perfect alignment.

As previously mentioned, when we first referred to the Indian two-stroke, the design of the front forks is interesting, for they are the same as those found on the original Indian when it was first introduced into this country in 1909. It must be admitted that the design of the machine is most attractive. The sloping top tube, giving a low saddle position, an efficient carrier, and stand are excellent features, while the generally symmetrical outlines are particularly pleasing to the eye.

The usual twist grip control is fitted, and from the shape of the handle-bars and the size of the saddle it will be noted that the comfort of the rider has been well studied. The silencer is of large dimensions, and particular care has been exercised to render the engine quiet, as



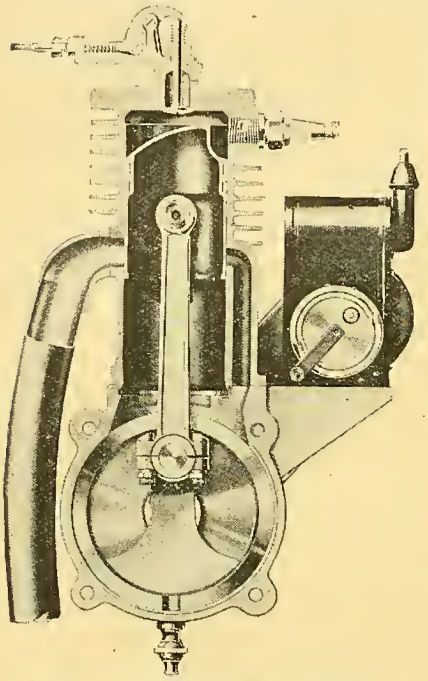
(Left) Plan view of gear box, clutch, and kick-starter on the two-stroke Indian. Note particularly the new sliding double pinion splined to the main shaft. (Right) The gear box viewed from the exterior, showing kick-starter mechanism.

New Models.—

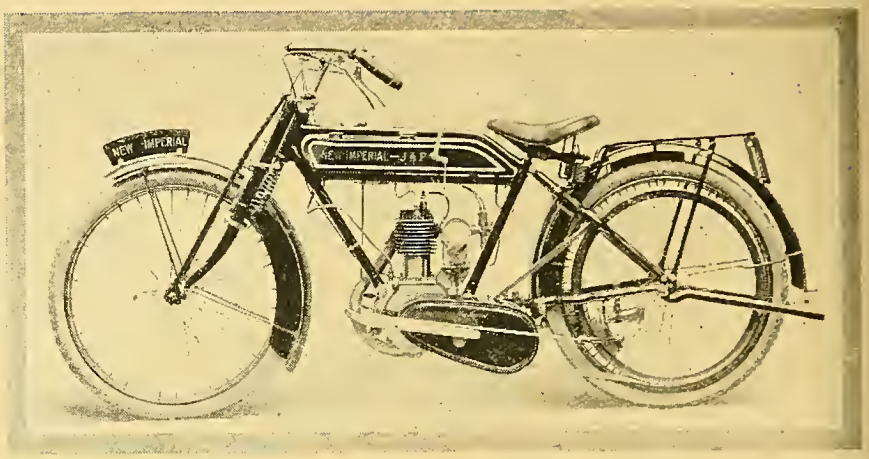
noise has hitherto been a common failing in two strokes.

The foregoing details of this and the firm's other models were obtained just on going to press, and we hope to refer to the other type Indians in our next issue.

This new model and the 7 h.p. engine with side-by-side valves, already referred to, constitute the principal Indian innovations for 1916.



Sectional view of the two-stroke engine fitted to the new 2½ h.p. Indian lightweight.



Latest model of the 2½ h.p. New Imperial. Two modifications yet to be made are extending the exhaust pipe still further and fitting adjustable foot-plates.

NEW IMPERIALS FOR 1916.

A Number of Detail Improvements.

THE alterations made to the 2½ h.p. ladies' model have been but slight, these alterations, however, making the machine a great deal more handy and serviceable than before. In the first instance, there is a metal disc clutch, controlled by a lever placed close to the left-hand grip, and having three discs with cork inserts held against plain steel discs by four coil springs adjustable without removing any part of the clutch cover or protecting shields. A long rod passes through the driving shaft of the two-speed box and, acting on a collar, presses the four springs outwards, thus disengaging the discs from one another. The action renders the clutch remarkably easy to handle as is essential in a machine made for the fair sex.

The Brake Work.

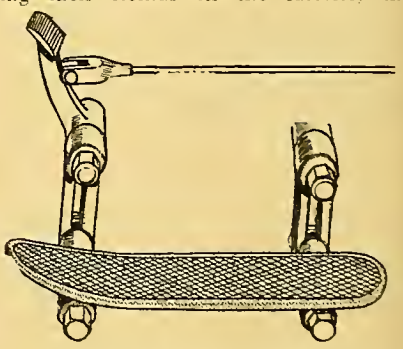
Dressguarding, an afterthought in far too many machines, is carefully considered in this particular case, the shields being placed with much ingenuity so that the mechanism is concealed completely, while no part becomes inaccessible. As will be seen in the sketch, the cylinder guard also is a wind scoop, yet the contact maker can be removed without detaching the guard, again the neat clutch shield exposes the coil spring adjusting collars.

Brake rods are somewhat a problem. If they are to clear the driving mechanism, the pedal being on the forward footrest, a crank is necessary, but this crank is liable to whip, making the brake uncertain. To overcome this the 1916 New Imperial brake rod is straight to a point near the brake shoe. Connecting the two is a + section cast arm, so stiff that whip cannot occur despite the crank necessary. This year the brake shoe is above the chain stays instead of below them.

Another detail of value is the adjustment for the footplates of the 2½ man's model, which adjustment, we were informed, was evolved while striving to fit the small machine to a particularly long armed subaltern.

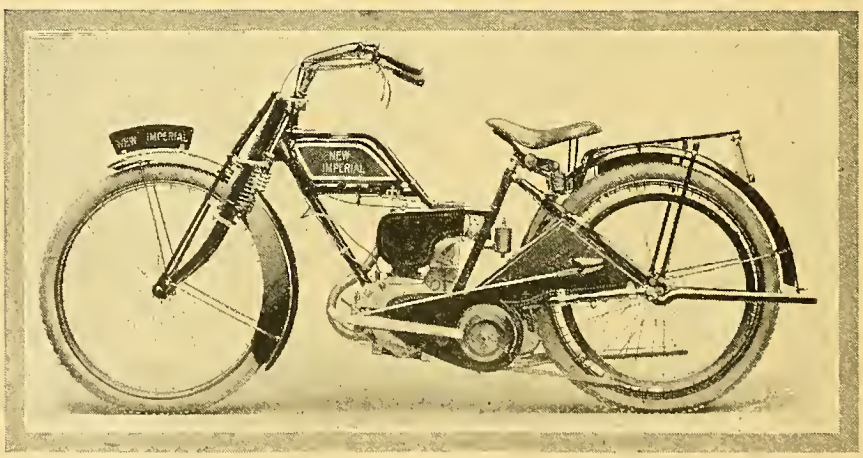
As will be seen from the sketch each plate is hung from the supporting rods by slotted links. Now, by undoing all four nuts the footplate can be moved fore and aft or raised in the slots to suit the rider. An adjustment of this type is most necessary if the comfort of every rider is to be considered.

To benefit those who insist on carrying their friends on the carriers, the 1916 model has this accessory greatly strengthened, and of tubular construction throughout.



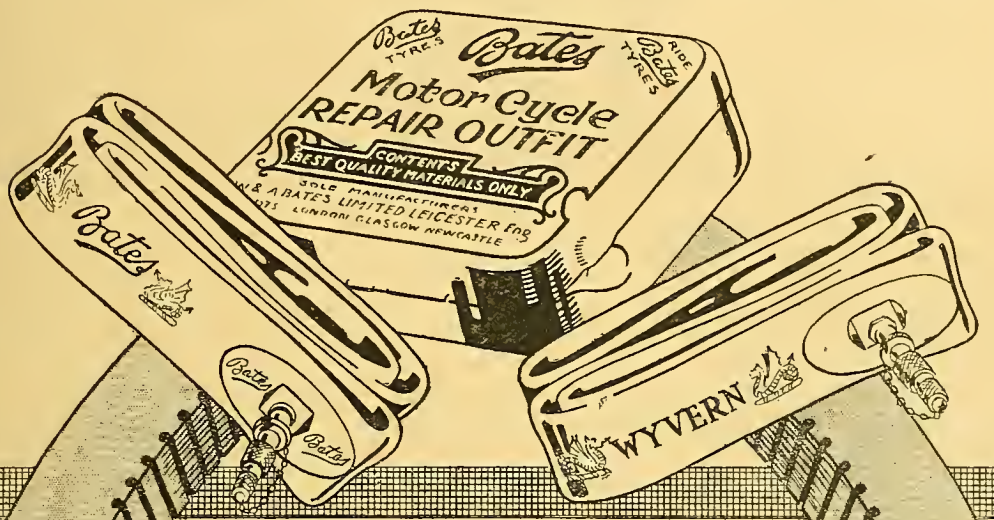
Slotted links allowing the foot-plates of the 1916 New Imperial to be adjusted in any direction.

A lever on the handle-bars now controls the ignition advance of the ladies' model in place of the old tank lever, while there will be a much longer exhaust pipe leading from the silencer and clipped to the chain stays near the rear spindle, experiments having proved this to be of greater efficiency.



1916 pattern lady's New Imperial. Note slot in mudguard for brake-operating arm. The brake shoe is now above the chain stay instead of below it

"Little things that help to kill big trouble."



Bates-built accessories are just as famous for excellent service as are Bates-built tyres. Everything from a belt to a puncture patch is thoroughly reliable and can be depended upon to do its job.

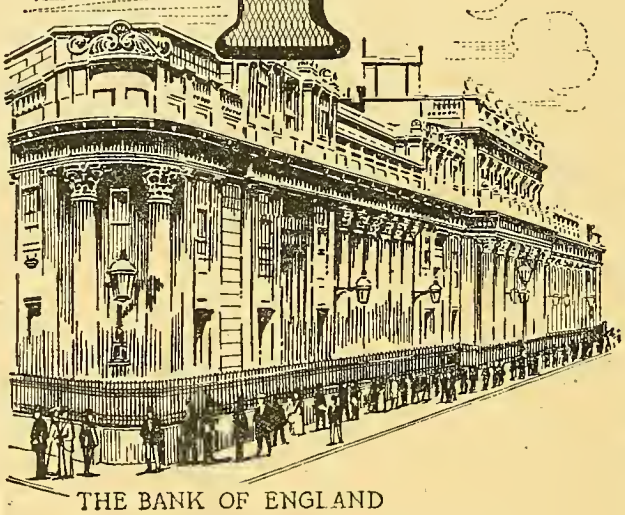
Thrift



THE BANK OF ENGLAND

THE BANK

The symbol of wealth in reserve.

The thrifty buyer helps the Bank by purchasing only goods with a high reputation, ensuring that the first cost shall be the only cost.

In the Motor Cycle World, the Bank, by reason of the sum involved by purchase, demands the closest attention. Too low a price may be paid, setting up a continuous run on the Bank for repairs, replacements, etc.

The B.S.A. Trade Mark attached to the motor cycle tells of a reputation too highly placed to be lightly hazarded, of workmanship above suspicion, of unequalled productive facilities and a fixed determination to give entire satisfaction under the only two headings which count—price paid and value received. The whole of the B.S.A. organization, reputation and resources are behind the B.S.A. guarantee.

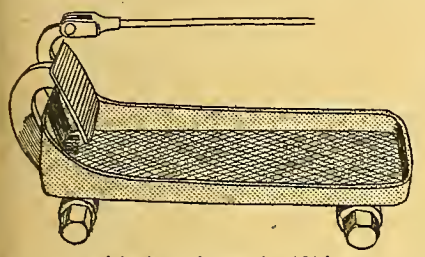
IMPROVEMENTS TO THE O.K. MACHINES.

ALTHOUGH the 1916 O.K. Junior motor cycles in the main are to remain unaltered, the detail work has undergone a certain amount of redesigning.

Firstly, improvements are to be effected to the gear control, which improvements are not sufficiently advanced as yet to warrant detailed description.

Secondly, the foot brake control is distinctly improved, being now placed so that the pedal projects over the footplates, and is relatively in the same position to the foot as is the case on a car; therefore it is unnecessary to remove the foot from the footplate, and a steady braking pressure becomes more possible.

As is the case with some of this year's models, the petrol tank has its seam along the upper surface and immediately below the top tube, a position where



Position of brake pedal on the 1916 pattern O.K. Junior.

this, the weakest point of a tank, is very securely guarded.

A casting replaces the strip iron used to secure the chain case in position, thereby stiffening the case, while it is probable that a sliding panel will be formed in the case itself, in order to allow the rider easily to inspect or remove the chain. Such small details as this frequently escape a designer's notice, and many a private owner has been prevented from giving necessary attention to a much ill-treated chain by the difficulties of obtaining access thereto.

1916 WULFRUNAS.

THE chief alteration made by the Wulfruna Engineering Co. affects the 4 h.p. and 5 h.p. machines placed on the market for 1915. Of these, the first is to have an Abingdon King Dick engine, and the frame is greatly altered, having a sloping top tube from the head straight to the seat pillar, and a longer head than hitherto. This entails redesigning the petrol tank to suit the altered frame, and brings the machine in line with other manufacturers, as the sloping top tube seems to be a feature for 1916.

A black enamelled tank picked out with gold will be used for all models for the next season, thereby adding very greatly to their workmanlike appearance. On the larger model a 6-7 h.p. Abingdon engine replaces the 5 h.p. of 1915, but the frame remains unaltered.

On all models a new heel-operated fibre-faced brake is used, the V block pushing into the belt rim slot, a change allowing the rear wheel to be extracted without interfering with any part of the brake gear.

The 4 h.p. and 2½ h.p. are to have the clutch slightly altered, and it will be placed on the right-hand side instead of on the left, while the altered 4 h.p. frame entails a slightly shorter wheelbase.

The 70×70 mm. engine is to be fitted to the 2¼ h.p. two-stroke model B as standard, this machine remaining practically unaltered otherwise.

Druid forks, already fitted to the 5 h.p. and therefore to the 6-7 h.p. model, in future will be on the 4 h.p. machines as well, while Amac or Senspray carburetters can be provided for any model, according to the customer's wishes.

A SURPRISE FOR ROYAL RUBY RIDERS.

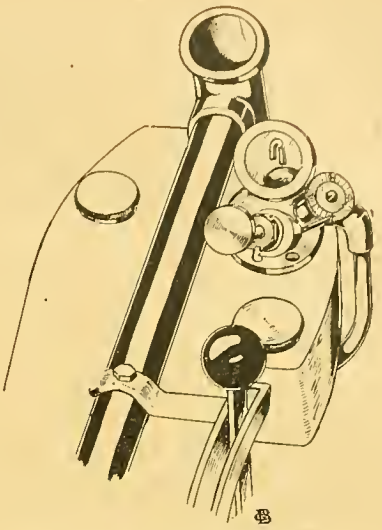
THE makers of the Royal Ruby will have a pleasant surprise for the riders of their heavyweight machines in 1916. As yet the new model is hardly an established fact, but we understand that several interesting alterations are to be made.

One of these alterations, which we most highly applaud, is the incorporation of a rear spring frame, at present under course of road test. It promises well, and should add much to the popularity of this already famous mount.

In the Overseas Dominions the popularity of the Royal Ruby is well established, and it is chiefly in consideration for their Colonial riders that the makers have decided to adopt a system of rear springing.

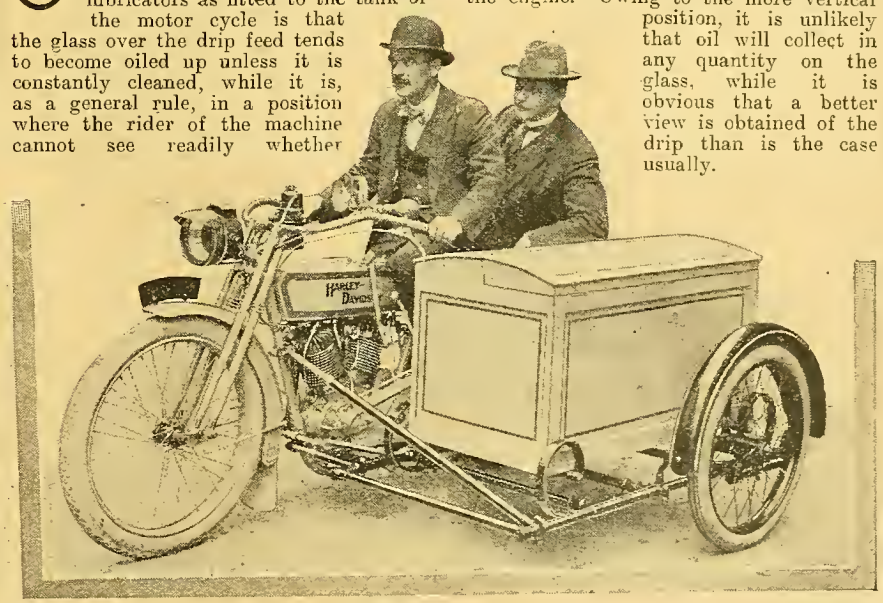
A NEW SIGHT FEED LUBRICATOR.

ONE of the difficulties which appear to be inseparable from the pump lubricators as fitted to the tank of the motor cycle is that the glass over the drip feed tends to become oiled up unless it is constantly cleaned, while it is, as a general rule, in a position where the rider of the machine cannot see readily whether



Latest Best and Lloyd drip-feed pump, having a readily visible glass

oil has ceased to flow or not. As the advantages of this type over the old direct pump consist almost entirely in the fact that it is possible to see exactly when oil has ceased to flow to the crank case, and thereby to regulate the quantity issued per mile, it is obvious that the glass of the sight feed must give a clear view of the drip. To obviate the above difficulties, the new Best and Lloyd lubricator has been produced. In this model the pump is exactly the same as hitherto, having a brass filter gauze at the bottom, and sucking oil from the main tank, but the metal sight feed is at an angle of 45°, facing the rider when he is seated on the machine. At the right-hand side is the notch and graduated disc which controls the amount of oil admitted to the engine. Owing to the more vertical position, it is unlikely that oil will collect in any quantity on the glass, while it is obvious that a better view is obtained of the drip than is the case usually.



One of a fleet of fifty-six Harley-Davidson sidecarriers supplied by Messrs. Robertsons to the Russian Government for the transport of ammunition, petrol, and oil Capt. Korotkevich, the Russian Government's representative, is seated on the carrier.

Can Any Reader Assist?

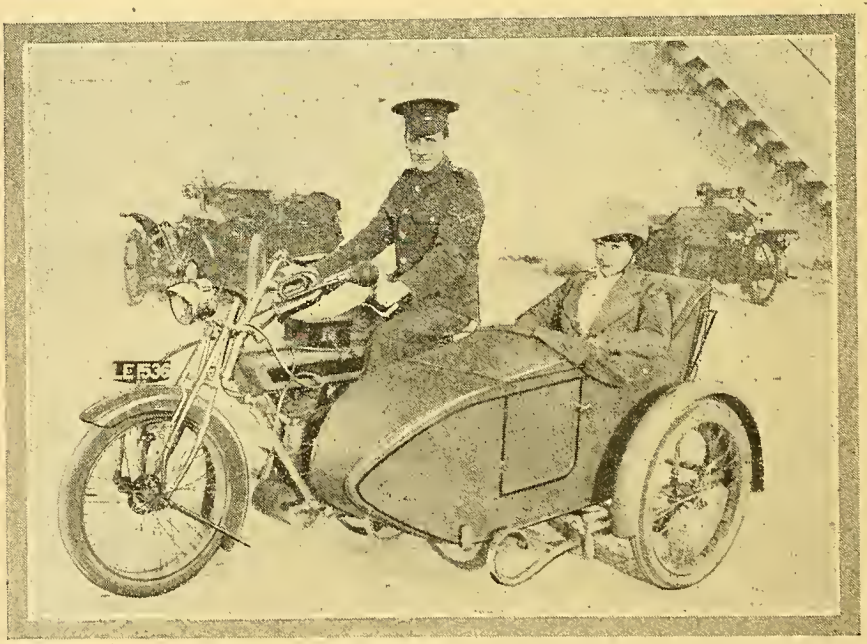
A Corporal, who has been invalided home through heart trouble, asks if we will appeal to some kind reader to let him have a motor cycle, either in the nature of a gift, loan, or at a very low price. He is attached to the staff of a Devonshire hospital three miles from the nearest town, over a hilly road, and his duties necessitate frequent visits there, although no transport is provided. Any offer received will be forwarded to the proper quarter.

Poor Engine.

The case mentioned in our last issue of the rider of a 5-6 h.p. Bat who had used unwittingly carbolic disinfectant for four months for lubricating his engine naturally caused a certain amount of amusement. The remarkable thing was that beyond poor running the engine received no damage. Similar cases are not unknown, especially in the early competition days, when the refilling of petrol and oil tanks was not so carefully supervised as it is now.

Animals on the Highway

The question of animals straying upon the highway is one of great importance to motor cyclists and car drivers, as owing to the chaotic state of the law great difficulty is experienced in proving negligence and liability against their owners. However, a case recently heard before Judge Radcliffe at Warwick County Court reveals some rather interesting facts. The charge against defendant was that of allowing a number of sheep to stray on the highway, which resulted in a motor car being overturned, for which damages were claimed. It appears that defendant had previously been fined for a similar offence. In giving judgment for the plaintiffs, his Honour said that defendant owed a duty to the public in general, and plaintiffs in particular, to prevent his sheep straying on to the highway; that he committed a breach of that duty by maintaining an inadequate fence between his field and the road, as a natural consequence of which his sheep escaped on to the highway and caused damage to the traffic thereon, and that as a natural consequence of such escape the accident was caused to plaintiffs' car, and particular damage done to them thereby. He would, therefore, give judgment for plaintiffs for £100 with costs on Scale C.



Lance-Corporal W. Pratt, the erstwhile P. and M. rider, who once covered six hundred miles under A.C.U. observation without using a tool. Pratt spent the winter in France, driving an ammunition lorry with the A.S.C., but was invalided home.

SPECIAL FEATURES.

MANY 1916 MODELS DESCRIBED AND ILLUSTRATED.

TWO-STROKE OR FOUR-STROKE?

MILITARY MOTOR CYCLING MATTERS.

Condition of the Hastings Road.

Visiting Hastings last week, a correspondent fonnd the direct road *via* Tonbridge and Battle in excellent trim. The alternative road *via* Catsfield and Bexhill is in wonderful shape.

The Latest London Lighting Order.

According to a statement made by the Press Bnreau last week, it is possible that public lighting of both main and side streets may be somewhat increased. The Commissioner of Police desires to emphasise the need for caution both by drivers of vehicles and *by foot passengers*. He has nrged the local authorities to assist the traffic by whitening street refuges and kerbs at street corners, and this course has already been followed by several borongh councils with excellent results.

Many Young Riders.

The reference in our correspondence columns last week to a gentleman prepared to offer a cup to any person of fourteen years who can drive an 8 h.p. sidecar outfit from London to Bournemouth has brought letters from various yonng readers in different parts of the conntry prepared to undertake the run. It would seem that the number of boys of 14 to 16 capable of motor cycle touring is much greater than the cup donor is aware.

What Colonial Machines have to do.

Two Capetown riders have recently made an adventurons tonr of the Northwest district of the Cape Province. The object was Calvinia, and a different route was followed on the return journey from that taken outwards. Much of the route followed is practically unknown to motor cyclists, and in some places the riders attracted considerable attention. A feature of the tour was the high altitnde reached, such as a 3,000 feet rise in a steady nine miles climb. This and the fording of eight rivers were severe tests for the 3½ h.p. Sunbeams on which the men were mounted, and it is remarkable testimony that only one involuntary stop (due to a sooted plug) was recorded. Many of the rivers were so deep that the magnetos and carburetters were entirely submerged, but both engines always fired at the first kick upon reaching dry land again! Sometimes the road surfaces were good, but at others many miles of sandy surface had to be tackled.

The Institution of Automobile Engineers.

On Wednesday, November 10th, Mr. J. H. Dickenson will read a paper entitled "The use and abuse of steel in automobile construction."

The Munition Workers' Competition.

The A.C.U. has decided that the support promised for the proposed munition workers' competition was not sufficiently great in any one locality to justify the Union going ahead with the proposal.

The fact that sufficient promise of support was not forthcoming is not surprising. Club secretaries well know that even when the date of an open event has been settled entries do not flow in until the last minute. Often club committees, a fortnight before the event is due to take place, are in a quandary as to whether to go ahead with an event owing to lack of entries, when a week later a record entry has been received. The A.C.U. decision, therefore, counts for little in this instance.

Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model, the average for the past week is quoted. If at least two machines were not advertised, the last occasion on which they were quoted is given.

"The Motor Cycle" Buyers' Guide.

It is nearly ten years since *The Motor Cycle* Buyers' Guide was instituted. In the absence of a show, the compilation of a Buyers' Guide of 1916 models becomes more urgent and necessary. Thursday, November 25th, has been selected as the date of a special number embodying such a feature.

Problems.

We deal in our leaderette this week with problems which still confront the manufacturer of two-stroke engines. Excessive carbon deposit and a mysterious metallic rattle which is occasionally set up are the two outstanding troubles. *The Motor Cycle*, which has fostered the two-stroke engine since its adoption for motor cycle use, draws attention to the difficulties, and expresses the opinion that they are not insuperable.

A Pillion Seat Trial.

Whilst a continuous outcry is raised in England against the carrying of passengers on the carriers of motor bicycles, it is interesting to note that a trial has recently been held in Holland for pillion seats, prizes being awarded to the best designs. There was a good entry list, and various types of carrier seats were represented, from the simple cushion to the canework seat complete with upholstery.

The National Relief Funds.

At the week-end the principal relief funds stood as follow:

	£	s.	d.
The Prince of Wales's Fund	5,541,184	0	0
The Queen's Work for Women Fund	165,801	7	9
Belgium Relief Fund (approximately)	975,000	0	0
The Times Fund for the Sick and Wounded	1,744,097	0	8
The Weekly Dispatch Tobacco Fund (exceeds)	85,203	13	8

Exclusive Descriptions of New Models.

Six pages of this issue are devoted to illustrations and descriptions of new model motor cycles, several machines being introduced to the public notice for the first time.

Motor Cyclist Recruits.

It is interesting to learn that the London Motor Cyclist Reserve Committee, of which Mr. T. W. Loughborough, secretary of the A.C.U., is secretary, has dealt with 3,419 applications since the beginning of the war, and of this number 459 motor cyclists have actually enlisted as despatch riders attached to the R.E. Signal Service.

Motor Cyclists on Active Service.

H. B. Elliott, of the business staff of *The Motor Cycle*, has been granted a commission in the Motor Machine Gun Service. He is the fifth member of *The Motor Cycle* staff to answer his country's call.

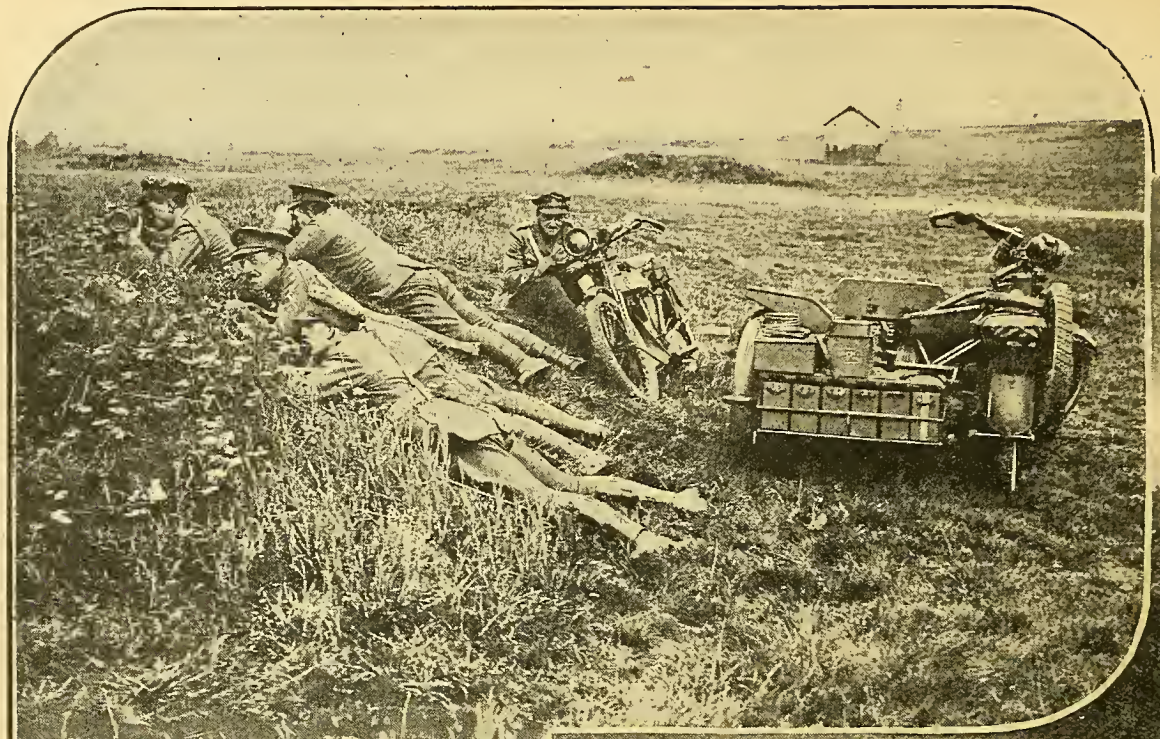
The number of employees of Messrs. Iliffe and Sons Ltd., proprietors of *The Motor Cycle* and allied papers, who have joined the Colours now amounts to 128.

A Busy Man.

With regard to a note in a recent issue, mentioning that there were no officials at the Army and Navy hill-climb attached to the Services—which was a fact according to the printed regulations—we have a letter from Second-Lieutenant F. L. Bassett, who has evidently interpreted our paragraph in an entirely wrong light, stating that he was clerk of the course and chief marshal, as well as chairman of the organising body, the Streatham and District Motor Club. Mr. Bassett was evidently a very busy man, as he was also a competitor in the event, and obtained first and second awards. This position, however, is not compatible with A.C.U. rules.

TRACK RACING IN AMERICA.

Two Indian riders travelling on the Tacoma speedway at a speed in excess of 80 m.p.h. The illustration gives a good idea of the magnificent board track.



Our Khaki Motor Cyclists.

THE series of exclusive photographs reproduced on this page show some of the gallant motor cyclists of the Motor Machine Gun Service. Many finely-built fellows who have served their novitiate on a motor cycle are already overseas on active service with this section, and hundreds of other no less willing and

enthusiastic riders are now undergoing the training necessary at the different training camps established in various parts of England to fit them for active service.

Meanwhile the motor cycle factories of the Midlands, notably the Clyno Engineering Co., are working day and night to provide the machines for the Vickers-Clyno machine gun equipment.

The M.M.G.S. is a "motor cycle" section throughout—even from the recruiting! The commanding officer has a touring type sidecar, whilst the subalterns are mounted on motor bicycles. The training of a motor machine gunner

THE HIGH-POWERED TWIN.

By "IXION."

ONE reason for the comparative unpopularity of the 7-9 h.p. twin in England as contrasted with the United States is that the American rider seldom takes the road in winter, whereas most of us ride throughout the year, so long as it is moderately dry overhead and not too cold. When the temperature is low and the roads are filthy only the daring owner cares for speed; and as these conditions rule four months of every year, and are not unknown during the remaining eight months, there are many, many days in a twelvemonth when the reserve capacities of a big twin are largely wasted. Once again the majority of our riders are short distance men, and if a man's definition of a "spin" is limited to fifty or sixty miles as a maximum, the amount of traffic riding looms rather large in his purview, for our towns are close set. *Per contra*, if a man is accustomed to ride from Carlisle to Nottingham or from Coventry to Cornwall five or six times in a season, the long stretches of open road bulk higher in his choice than the miseries of threading a factory town after a shower and in the dinner hour. So long as my club knowledge was confined to London, Coventry, and two or three very sporting provincial clubs, I failed to realise what short distances normally content the average rider; there are plenty of country clubs which cannot coax their men to rendezvous twenty miles from the base.

Weight in Traffic.

For myself I regard a "baby" two-stroke and a road-burning 8 h.p. as equally manageable in traffic; but the rather nervous and inexpert rider is by no means of my opinion. He knows that the "baby" will not leap away so ferociously if he blunders with a lever; he knows he can paddle it off with his feet if he gets blocked; he knows it will not fall so heavily if he skids on a greasy tramline: he knows, too, that it is easier to hoist on to its stand or to prop against a kerb. He may enjoy an occasional speed burst on a big twin-cylinder machine over dry summer roads as much as I do; but he also recalls cannily that from his point of view the roads are more often than not too wet or the weather is too cold for speed. He reviews his intended week-end spins, and reflects that he finds the light and medium weights more handy when he traverses the towns in his county, which are his real *bêtes noires* on every ride, and so he buys one of the low or medium-powered bicycles.

In sober fact, the big twin is almost as manageable as the lightweight in these days of refined carburetters, silky clutches, and variable gears. I had practically as soon cross London on an 8 h.p. as on a 2½ h.p. I have only two objections to the big twin, and they are rather of the paper order. One is that their tyres are less easy to handle when a puncture overtakes one; the other is that I detest hoisting a 3 cwt. monster on to its stand. Contrariwise, I admit that the 3in. tyre is not readily perforated by the little nails and tintacks with which city streets are bestrewn, and that one hardly ever uses a stand except in garage or for serious repairs; by the roadside one can usually pick out a grass turf edge which will do as well.

It cannot be denied that your nervous man takes some converting. It is no use to preach the delights of 50 m.p.h. on the flat or of accelerating up a single figure grade. He knows that his little machine is not at all comfortable at 35 m.p.h. on a bad road, and his mental conception of speed is the maximum discomfort of his "baby" multiplied by ten. It is useless to point out the sturdiness of your 8 h.p. to him, nor yet to rip past him all out in an exhibition dash. Some faint spark of surviving manliness in his soul may twitter enviously at the spectacle, but in reality he will be horribly frightened.

Power for Passenger Work.

Wait till he buys a sidecar. He will gradually acquire a hearty contempt for low-powered lightweights regarded as tourist vehicles for able-bodied men; and in time he will conceive his doubts of the 3½ h.p. It will teach him in time that 35 m.p.h. on the flat is a safe and comfortable speed, and when he indulges this weakness he will note in time that the big twin which flits past him is making far less pother about a greater speed. Then he will commence to picture the idea of fast climbing. He will grow dissatisfied with the slow and noisy progress of his under-powered outfit up grades, as the "hefty" twins roar past him doing countable revolutions on top gear in a manner that suggests reserves of acceleration on demand. Finally, he will very timidly order a 5-6 h.p. sidecar outfit, and, unless the sidecar chassis is brazed up solid with the bicycle, sooner or later the 5-6 h.p. will come out solo. Much to his surprise he will return home alive and exhilarated; and then there will be a chance of these points being settled on their merits.

In the meantime, I rather fear that the very common dread of long distances and high speeds indicates a certain deterioration in the national virility. Crowds of youngsters on 7-9 h.p. machines may become a sad nuisance at times, and even a public danger; but if a day ever came when only one man in a thousand wanted something more lively than a 2¼ h.p. machine, old England would certainly be on her last legs. The war has at least warned us that there is a high percentage of milksops in our manhood, and that a superabundance of rude and unbridled youth is not wholly a bad sign. Bernhardi certainly hit a nail on the head when he talked of the enervating effects of peace and prosperity. I have a new respect for the "knut."

THURSDAY, NOVEMBER 25th!

The date of THE MOTOR CYCLE BUYERS' GUIDE OF 1916 MODELS.

The issue will be considerably enlarged and will contain an illustrated review of the various 1916 pattern motor cycles.

"THE MOTOR CYCLE" RECRUITING SECTION.

DESPATCH RIDERS WANTED BY THE R.E.

ONE morning last week the Overseas mail brought us seven applications from Colonials anxious to enlist in the different motor cyclist sections of the Army.

Among the recruits who have enlisted as car drivers and mechanics in the Motor Machine Gun Service during the last few days are :

B. Bourke	W. Watson
F. L. Brown	(Timaru, N.Z.)
H. Readhead	W. L. Meredith

B. Bourke was for ten years with the New Hudson Cycle Co., Ltd., and has frequently figured with success in open trials. He was also a prominent member of the Midland Motor Cyclists' Volunteer Corps.

A Call for Despatch Riders.

Last week we received a call from Second-Lieut. H. Smith, R.E. (whose address is 6, Brynland Avenue, Bishopston, Bristol), who emphasised the need for more despatch riders on the waiting list of the Royal Engineers. A regular call for men from the R.E. has drained the South Midland Divisional areas' list of names.

Applicants for positions as despatch riders must be experienced motor cyclists able to perform all ordinary running repairs. The age limits are 19-38. Enlistment for duration of war. Pay 2s. 6d. per day, plus 6d. on completion of training.

Motor cyclists in the South Midlands should apply to one of the under-mentioned inspecting officers for particulars and an appointment for a riding test:

R. C. Davis, 11, Hythe Bridge Street, Oxford.

F. O. Moseley, Summerbrook University College, Reading.

P. Cann, Queen's Hotel, Clifton, Bristol.

G. Smith, Editor *The Motor Cycle*, Coventry.

North-country Motor Cyclists Wanted.

The secretary of the Motor Cyclists' Reserve Committee in the West Lancashire Divisional Area, Mr. S. W. Phillpott, of 60, Lime Street, Liverpool, has received notice to double the number of despatch riders supplied regularly each month in his area, and therefore appeals for motor cyclist recruits to pass the test and have their names put on the waiting list.

Wessex Divisional Area.

Motor cyclists residing in the counties of Devon, Somerset, Cornwall, Hants, Dorset, and Wilts., will be examined as to their technical abilities by one of the undermentioned inspecting officers of the Motor Cyclist Reserve Committee :

Captain G. Thorp, R.E., Military Central Telephone Exchange, Devonport.

Mr. G. E. Dominy, 39, Jewry Street, Winchester, Hants.

Mr. T. Golsworthy Crump, 8, St. George's Terrace, Taunton, Somerset.

On passing the examination, a candidate's name will be placed on the register, and as a vacancy occurs he will be enlisted in due course.

Well-equipped for bad weather. A Douglas mounted despatch rider Corpl E. Hooper, R.E., who has been with the B.E.F for twelve months.

WITH THE B.M.E.F.

LIEUT. F. E. MOCATTA, R.F.A., who is at present serving in the Mediterranean Expeditionary Force, writes as follows: "*The Motor Cycle* forms quite a link with home, and I always look forward to the next copy The machines out here, nearly all Douglases and countershaft Triumphs, have had a very 'thin' time, owing to an almost complete lack of roads; but, on the whole, they have stuck it marvellously well. Truly it will be a strange experience to ride on a surfaced road again."

IMPORTS AND EXPORTS.

THERE is a drop both in the number of motor cycles imported and exported compared with August. The decrease in the exports is a large one, and follows on a small decrease that the August figures gave when compared with the July figures. It is doubtless due to the fact that more factories have been taken over by the Government.

IMPORTS.

SEPTEMBER, 1915.—437 motor cycles, value £20,859 (complete with parts and tyres not imported with complete machines, £30,126).

AUGUST, 1915.—645 motor cycles, value £38,582.

SEPTEMBER, 1914.—36 motor cycles, value £1,389.

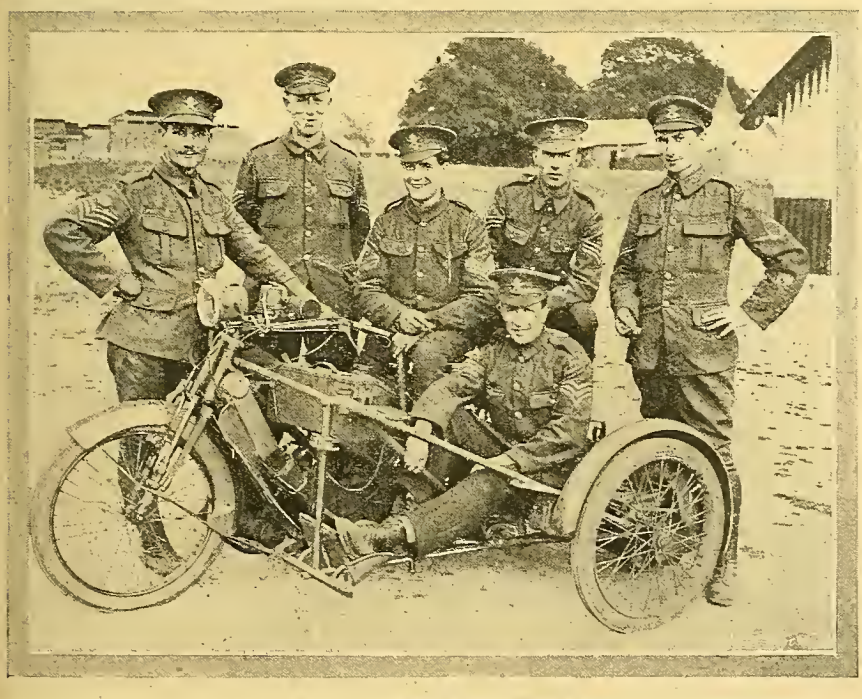
EXPORTS.

SEPTEMBER, 1915.—637 motor cycles, value £28,847 (complete with parts and tyres not exported with complete machines, £52,188).

AUGUST, 1915.—1,092 motor cycles, value £54,347.

SEPTEMBER, 1914.—1,004 motor cycles, value £44,018.

The Board of Trade returns have a special note to the effect that motor cars and motor cycles and parts thereof (except commercial vehicles and tyres) are subject to duty on and after September 29th, 1915.

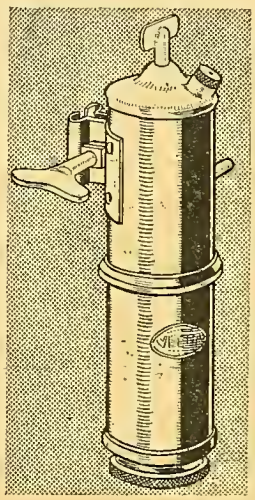


SIX N.C.O.'s OF THE M.M.G.S. WHO WERE WOUNDED AT THE FRONT.

The photograph was taken a few days ago at the M.M.G.S. training centre, and it shows that the men are well on the road to complete recovery. From left to right: Sergts. C. W. Stowers, L. A. Allen, F. J Harlow, R. Jones (on sidecar). J. G. Ougham, and Bombardier F. Beauvais.

A NEW TAIL LIGHT GENERATOR.

THE accompanying sketch shows a neat and well-made tail light generator recently placed on the market by Messrs. Brown Brothers, Ltd. The generator is constructed on standard lines, and presents no special mechanical features, differing only from the ordinary generator in that there is no spring device for keeping the carbide in position in the carbide container.

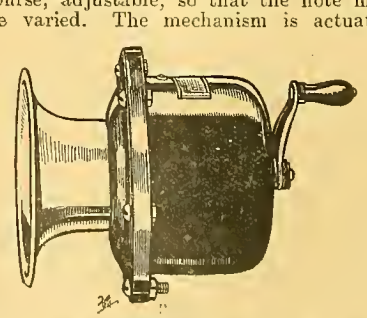


The Brown tail lamp generator.

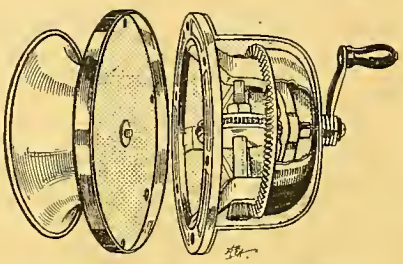
A NEW MECHANICAL HORN.

YET another mechanical horn has recently been placed on the market. The Taylor, as it is called, possesses several interesting features, one being the oil hole at the top which conveys the lubricant to the three places where it is most needed. The interior mechanism is clearly shown in one of the accompanying sketches. It will be noticed that it is exceedingly simple, consisting as it does of a large bevel and a small crown wheel, on the spindle of which is mounted the wheel engaging with the central pin in the diaphragm. This latter pin is, of course, adjustable, so that the note may be varied. The mechanism is actuated by means of a handle, which will allow a short note or a continuous sound to be emitted.

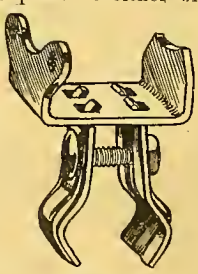
Another ingenious point is the clip, which is also clearly shown in the second of the sketches. It is adaptable, so that the horn may be placed on any size tube and arranged to point in either of two directions. It will be noted that one bolt only is necessary to secure the clip and the horn in a permanent and rigid manner. The standard finish is black, and the price one guinea. It may be obtained from Messrs. H. Taylor and Co., 21a, Store Street, Tottenham Court Road, London, W.C.



The newest mechanical horn—the Taylor, described herewith.



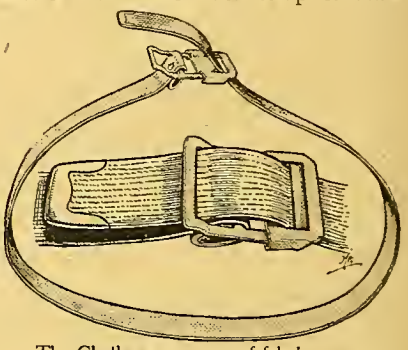
Interior mechanism of the Taylor mechanical horn.



The ingenious clip for fixing the horn to the top tube

CHALLENGE WATERPROOF FABRIC STRAP.

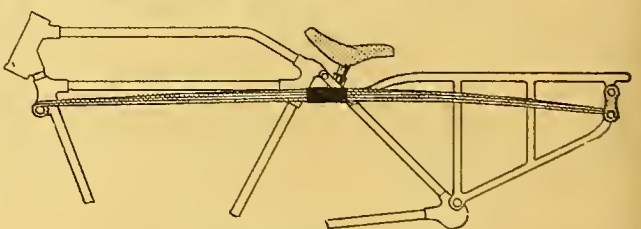
WE have received from Messrs. Brown Bros., Ltd., a sample of the Challenge waterproof fabric strap. The fact that it is made of a special waterproof fabric and not leather is one of its chief points of interest, especially as the price of leather is now very high; while the other is the ingenious buckle with which it is provided. The accompanying illustration clearly shows how this works. The end of the strap to be fastened is just passed through the sliding portion of the buckle and the strap pulled as tightly as possible. When the end is turned in and passed under the raised portion of the buckle, the strap is firmly locked in position, and will not slip. The material of which the strap is made is practically unstretchable, and is unaffected by wet. It is claimed to keep its colour under all conditions, and is suitable for tyre carriers, luggage grids, and other uses in connection with motoring. Straps are supplied in sizes from ½in. to 1½in., and are sold at from 6d. to 4s. each.



The Challenge waterproof fabric strap.

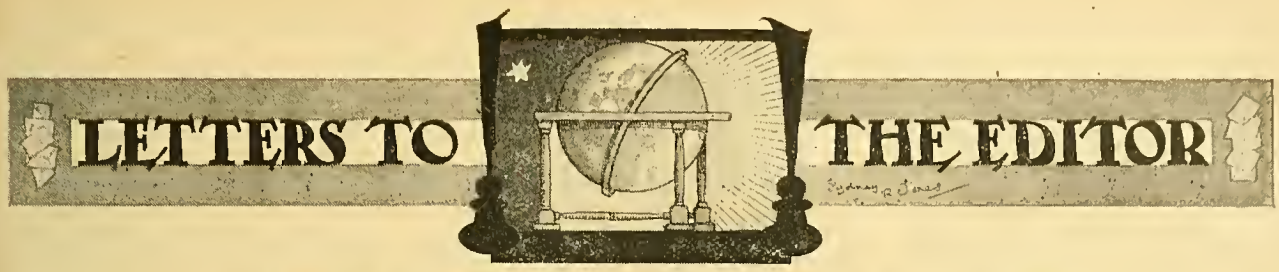
FOOT EASE.

UNDER this heading "Ixion," in the last issue of *The Motor Cycle*, said that he had never had anything so comfortable as a couple of pairs of rigid unsprung footrests which give a hold for the instep. This has brought forth a letter from the Kumfurt Motor Cycle and Accessories Co., who point out that one of their claims in their patented hammock footrests is "footboards flat or shaped to support the instep." So that readers may not be tempted to produce such a footrest, and so perhaps unconsciously infringe the Kumfurt Co.'s patent, we are asked to make mention of the above fact.



A LUXURIOUS SADDLE SUSPENSION.

An arrangement for springing the saddle patented by Mr. A. W. Gill, Barbados, West Indies. Two long leaf springs, one on each side of the frame, are used. They are attached at their forward extremities to the head lug, while at the rear they are slung on shackle pins. The saddle is fixed in the centre to a lug which binds the two springs together.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Motor Cycles in Gallipoli.

Sir,—As a letter in your issue of the 7th inst. gives the impression that no motor cycles are in use in Gallipoli, I wish to state this is not so. At Suvla Bay and across the Salt Lake district I saw motor cycles used. When I left (September 2nd) there certainly was not much room for their use. L.P.D. (CAPT.)

[*The Motor Cycle* has published a photograph of a group of motor cyclists landing. See issue August 19th.—ED.]

Infant Phenomena.

Sir,—Please allow me space in your valuable columns to state that I, aged 14, fail to see anything remarkable in Mr. F. Driscoll's son riding a 6-8 h.p. J.A.P. I myself ride, with the greatest of ease, a 7-9 h.p. electrically-equipped Harley-Davidson, which is infinitely harder to ride than a J.A.P.

As regards the cup offered by Mr. Driscoll, I do not think many other people would so disgracefully overload a machine for such a long run. I in no way wish to discourage Master Driscoll's efforts, but I fail to see the necessity of writing to two motor cycling journals about it.

F.E.P.

British Magnetos.

Sir,—Some time ago I noticed, in answer to your enquiries *re* the magneto position from home manufacturers, one firm was of the opinion that, as soon as the war is finished, the German-made instrument will be given the preference again. Since when I have looked for a contradiction from at least one of the principal makers, but failed to find it. Perhaps this point is not worth discussion, nor needing two thoughts, and this is the obvious reason for their not contradicting the statement.

Surely our memories would be short-lived were we to accept a machine with a German magneto, and buyers in the Colonies would certainly not think any more of the Home merchants for so insulting them. There will surely be a large demand for the British-made article, and a few shillings added to the cost of the machine (even were it equal to the present 5%) would not be grudged. In the course of time, when the public finds the home-made article at least equals the German, there would be no demand for the latter.

As regards most electrical goods, the German is the cheaper at the start, but the British cheaper in the end and infinitely better made and finished. We shall indeed be "soft" if we allow the Germans to regain the market. I suppose I had better certify that I have no interest in any concern of this sort, other than as a well-wisher.

"Ixion," some issues since, enquired for a hot grease suitable for hot climates. For the past two years I have packed my hubs, likewise gear boxes, with Price's Belmoline "A," and found this simply splendid for both purposes. There is no danger of this grease running from hubs in the hottest climate. PERCY C. DEWAR.

S. Rhodesia.

Clergymen and the Petrol Tax.

Sir,—I notice a paragraph in last issue regarding clergymen and the petrol tax, and I am sure your correspondent will wish to be absolutely correct in his remarks. I beg to advise him that he is mistaken when he claims that as a professional man he has to pay more by way of insurance premium than ordinary persons. This may be so with some companies, but from my own knowledge the policy arranged by the Auto Cycle Union through the Law Accident Insurance Co. gives full privileges to professional men without any increase in premium. Machines used for business purposes as apart from professional use do entail a higher premium. S. W. PHILLPOTT.

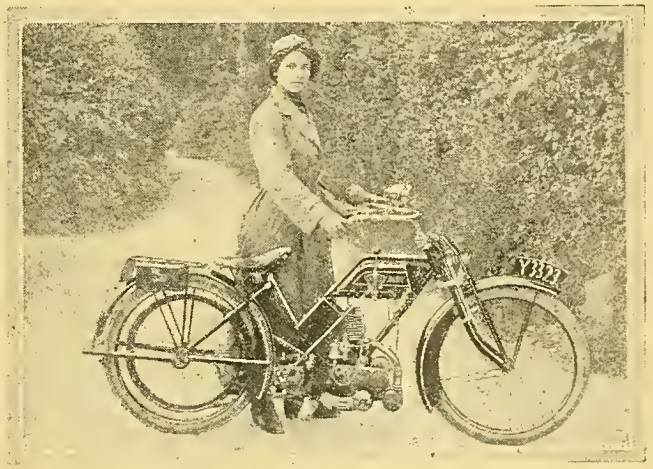
Sir,—I have been a motor cyclist for some years, and have often wished that the same reduction in petrol prices should be granted to clergymen as to doctors. In a parish like mine—seven miles in extent, with three churches and three villages to serve—the mileage that has to be covered every week for services, visiting, and parochial meetings is very considerable. I find my motor cycle of immense value for taking out into the country air people suffering with consumption, etc. So far my income of £140 per annum has not been taxed, now even that is to be reduced, so that I feel I must sell the motor cycle and take to the penitential "push bike" again until once more we have the blessings of peace. If the same terms could be granted to the clergy as to doctors I believe I could manage to keep on what is to me at one and the same time a help in my work and my one and only luxury! SPARTING PORSON.

Sir,—I thoroughly agree with your correspondent in last week's issue of *The Motor Cycle*. Like many other parsons, I find that this increased petrol tax is going to be a heavy burden.

Owing to the absence of my vicar on military service, I am left alone with a wide straggling parish of some twelve miles in area, when under normal conditions there is sufficient work to keep three hard-working priests fully occupied with the five villages which constantly require our ministrations.

The only solution to my difficulty was to purchase a small lightweight machine, so as to be able to give the parishioners the maximum of attention.

I do not contemplate any mileage at all except that in the exercise of my duties, as I have no time for personal



LADIES AND THE MOTOR CYCLE.

Miss Hilda Sage, of High Littleton, who reports having ridden her two-stroke Royal Ruby 2,000 miles without trouble.

amusement, even did I so desire it, which I do not, whilst hundreds of my parishioners are in the fighting line.

We wish to be patriotic and to support the Budget of a Coalition Government, but at the same time it seems hard lines that we clergy should have to pay the extra duty on petrol, whilst medical men, who financially are usually better off, should be exempt.

I trust that the great influence which your paper wields may be productive of a fair view being taken of the parson's motor bicycle, which in many cases is no luxury, but, unfortunately, a necessity.

CURATE IN TEMPORARY CHARGE.

Sir,—In reply to "$2\frac{3}{4}$" of last week's issue, I hardly think it is fair to myself and many hundreds of working men that professional men should grumble at the increased tax. Surely they have the means, whereas I am an insurance agent collecting £5 per week, with 20% commission only (no weekly wage). To collect this I have to go out four days each week and cover between fifty and sixty miles. If professional men can get a reduction, what about the hundreds who are situated as I am?

ERNEST ROBINSON.

Eliminating Weaknesses in Motor Cycles.

Sir,—With reference to Mr. Charles S. Patterson's letter concerning military motor organisation, I had waited so that perhaps someone more able than myself might reply. However, I beg to state my own personal experience in connection with this branch of the service.

In the first place, I have held a responsible post on the technical staff of one of the largest firms in the motor cycle industry for the past three years. Previous to this I was with another concern of equal standing in a similar capacity. My experience of the trade (actual practical experience) dates from 1906. In my working capacity I have been handling since the commencement of the war large numbers of official requisitions for replacements, spare parts, and repairs for motor cycles being used in the service of the Government both at home and overseas.

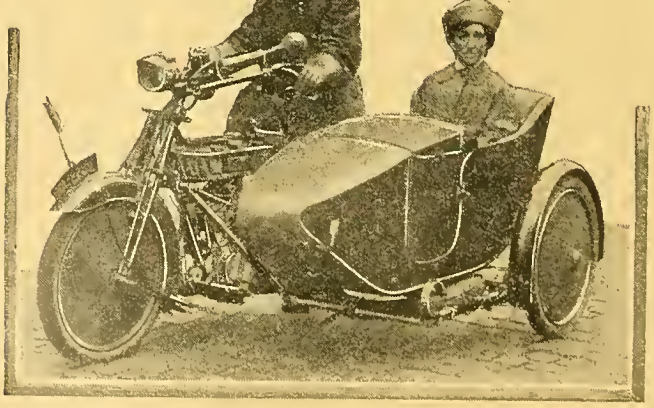
The absurd nature of the majority of these orders first drew my attention to the department in question. Apparently all orders are simply copied (accumulative errors as well) from the original request of the artificer right through the usual red tape channels to destination, when in the majority of cases the unit concerned has to be communicated with to find out really what is required.

Knowing from my own experience exactly what would be required to run the entire department in question as far as motor cycles are concerned, and considering that my knowledge fitted me to take up such duties without any preliminary training or waste of time, I applied for a commission in this branch.

Date of application, May 31st, 1915. Acknowledgment received June 14th, and necessary forms. These were satisfactorily completed in every respect as regards education, character, previous military service (six years), and technical ability; also accompanied by a splendid recommendation from the managing director of my firm.

Result—after waiting nearly four months, instructions received to attend War Office at my own expense for personal interview. Notification received four days later regretting the inability to utilise my services (perhaps I was too big). Coincident with this notification, the appointment was confirmed in the *London Gazette* of candidates for commissions in the A.S.C., M.T., of gentlemen *straight from Sandhurst*. These officers, whilst no doubt possessing a theoretical knowledge of military science, cannot by any means attain to that very necessary practical knowledge which is only to be obtained by years of practical experience in the shops.

However, I have offered my services and stood to lose all had they been accepted. That they have been refused is perhaps my luck, as time will show. TECHNIQUE.



An Enfield sidecar outfit, fitted with gold finished disc wheels, belonging to a Manchester reader. The appearance should be indeed striking

---

Overheating v. Red Hot.

Sir,—I have read the letter of Geo. F. Campbell in the issue of September 30th *re* cylinder getting red hot.

"Seeing is believing." A couple of months ago, between 9.30 and 10 p.m., in this town (Grantham), a soldier was riding a motor cycle, single-cylinder, going bang, bang, bang, bang, bang, etc. He went round St. Peter's Hill, came into the main street again, passed me closely, and then I was startled to see the engine red hot, not black, but the same as a red hot fire. W. BEECH.

Deserving of an Iron Cross.

Sir,—I came across a little incident recently that may interest your readers. I noticed a Douglas rider in trouble, so pulled up and put things right—merely a choked jet. I noticed while testing that the drip oil feed was turned off, and the engine seemed a little dry. The owner gave the startling information that he had used the machine nearly two years, five days a week, for business, about 150 miles per week, and his method of oiling was to pump three charges into the engine on starting out each day, and then to give no more oil till next day. This is a remarkable testimony to the efficiency of this engine, as it was in very fair condition after this ill-treatment. C. E. THOMAS.

Engine Rattle in Two-strokes.

Sir,—I have read with the greatest interest "Oile's" experiences in your last issue.

I have covered about 9,000 miles on this class of machine—6,000 on a Levis, and about 3,000 on my present Junior Triumph. Now, in each case, after about 500 miles running, this elusive rattle appears, and this on machines lubricated in totally different ways, *i.e.*, Levis drip feed to cylinder and bearings, Trinmph petroil. Taking the Triumph as giving my present experience, I find that the rattle seems to appear at certain critical road speeds, and not at engine speeds. For example, suppose I am travelling at 20 m.p.h. and open throttle to attain 24 m.p.h., the rattle will commence, but supposing the throttle is opened to maintain the 20 m.p.h. up a hill it will take it all without a murmur, or, if necessary, turn over very fast on low gear without trouble.

I have had the cylinder down four times, and, as your correspondent mentions, the top ring is generally stuck on the exhaust side (as was the case with the Levis), the bottom ring is always free, and the cylinder well lubricated. The bearings are in a very good condition.

I recently travelled to Town from Teignmouth, Devon, *viâ* the hilly Lyme Regis road. The whole journey of two hundred miles was done in ten hours, all hills except three were climbed on top, and yet, owing to engine rattle, I could not exceed 23 m.p.h.

I have tried Harcourt radiators on the Levis, but they failed to effect a cure.

I would like to say that I would not change my present Triumph for any similar machine. It is a splendid hill-climber, never four-strokes, even at starting, and last, but not least, the mudguards and fittings have been put on, not thrown on.

I feel that this rattle is common to the whole tribe, and would venture to suggest that it is not right for any rider whose machine has not covered at least 1,000 miles to say that his mount is free from this failing.

If your columns are the means of solving this problem you will deserve well of "two-strokers." A. C. BYRNE.

Paraffin Motor Cycle Lamps

Sir,—I should be glad to know if you or any of your readers could tell me where I could obtain a set of paraffin oil lamps for a sidecar outfit. I have been trying for some time to get these, but they do not seem to be obtainable. It seems to me they are just what are required in these days when lighting has to be low and expenses high.

P. W. JOHNSON.

A Satisfactory Two-stroke.

Sir,—I have often heard of intending motor cyclists being desirous of information respecting any make of motor cycle. I therefore send you particulars of my experiences with an Allon two-speed two-stroke, which I purchased early last June, since when I have covered 1,500 miles.

On August 3rd I commenced a seven days' tour, taking in Southend, Burnham-on-Crouch, Clacton, Yarmouth, Skegness, Grimsby, Hull, Bridlington, and Scarborough; returning by way of Malton, York, Selby, Doncaster, Sheffield, Derby, Tamworth, Birmingham, Droitwich, Worcester, Tewkesbury, Gloucester, Bristol, Bath, Newbury, Reading, Windsor, Staines, Kingston, and Sutton.

During the tour, and before, I have never had the slightest trouble with the Allon, and I have not encountered a hill which it would not climb. Since my return I have had the engine down, and was surprised to find it so clean; the cylinder and piston head were perfectly clean, and there was only a very small deposit round the top piston ring.

I may say that I have mostly used benzole and Vacuum T.T. oil. The engine has averaged from 90 to 95 m.p.g. of spirit. The machine can touch 45 to 50 m.p.h., and the low speed of 2 m.p.h. It is easy to drive and handle in the thickest traffic.

I am in no way connected with the makers of the Allon.

ALFRED D. WEBB.

[A lightweight two-stroke which can do 2 m.p.h. and also 45 or 50 m.p.h. is surely remarkable. It would be interesting to know how our correspondent certified his quoted speeds.—ED.]

Eliminating Weaknesses in Motor Cycles.

Sir,—The letter of Dr. Patterson comes as very pleasant to some of us who know some of the ways of the War Office, and probably explains why the War Office is about to send out to the Front machines with the same mudguarding which proved a failure last year (see your leader, page 293, September 23rd). It can only be brought about by the gross ignorance of those in authority. You have repeatedly put forth requests for improvement in military models, and I notice in your issue of September 23rd, page 299, a suggestion of how mudguarding can be improved to remedy the defect of machines as now used at the Front.

Now I ride a machine which is fitted with mudguarding devices, and have ridden it in all weathers over the muddiest slush you could imagine. I can ride with white shoes and white trousers on, and get not a splash, neither does my engine; as a matter of fact I never clean my engine, simply because it gets no dirt or grit on it. Of the efficiency of these devices I am convinced after nearly a year's riding over country mud.

The devices I refer to are Waigh's, and some time ago you had an article upon these patents for weatherproofing a motor cycle. Does the War Office not get a copy of your valuable paper?

I also have a rear mudguard which is the last word in efficiency. It incorporates a carrier with weatherproof pocket. Nothing could be better for military uses, and yet we go on supplying machines which have to be dismounted and cleared of mud every three or four miles, as you say in your leader.

Dr. Patterson, as a judge in the last A.C.U. Spring Trials, knows that mudguarding is essential, and that the methods in vogue are inefficient. It is of such men as he that we want to see our Board of Inventions composed, and then we may hope to see some progress. I might say that I am not at all financially interested in these patents.

D. PRYCE-JONES.

Machines for Despatch Riders.

Sir,—With reference to the paragraph headed "The Military Motor Cycle in France," giving the views of an ambulance driver (your issue September 23rd), I do not think many D.R.'s here would prefer a 2 h.p.-engined machine, such as is suggested, for the winter. Any machine lighter than a Douglas would be useless, as occasionally its power is taxed to the utmost. And the frames, as at present supplied with the 2 h.p. models, would collapse. We have enough trouble at present with frames and front forks

I think every D.R. will endorse the writer's other remarks, especially with regard to rear springing.

I was pleased to see your article on "Shields instead of Mudguards." Already I have had to stop half a dozen times to clean out the mudguards. If the makers will insist on fitting guards, they should give at least 2½in. clearance between the tyre and guard, and also fit stronger and much wider mudguards.

BRIGADE D.R., B.E.F.

Prices of Motor Cycles Overseas.

Sir,—In the Overseas Supplement for June 3rd a statement appears that the import charges on British motor cycles into New Zealand amount to 20%. This statement is frequently made out here by agents when discussing the high price of motor cycles; but it is not true. Some two and a half years ago I enquired from the collector of Customs at Auckland the amount of duty on a British 3½ h.p. motor cycle costing about £60 at home. The following is the reply received:

"From Collector of Customs, Auckland.

"February 28th, 1913.

"In reply to your letter of the 26th inst., I have to inform you that the engine, tyres, cranks and pedals, chain and chain wheel of an English motor bicycle are free, provided these articles are not attached to the frame. The duty on the frame usually amounts to from £3 to £4."

You will see, therefore, that the duty is far from being 20% on the whole cost. The cost of putting the parts together should be small, so that agents have in the past traded (and are now trading) on the ignorance of the public.

The law has not been altered since the above letter was received, though, of course, the war may bring a change any day.

NEW ZEALANDER.

Auckland.

The Modern Sidecar Outfit Compared.

Sir,—I have often thought that it was time I got rid of my three-year-old 4 h.p. single-cylinder sidecar outfit, but since watching the performances of similar new machines on the road I have decided to stick to the old mount for at least another year. The modern three-speed single-cylinder with coachbuilt sidecar may look better, but I find that my old two-speed with wicker sidecar is usually a good deal faster on the level and can also climb better. I have seldom any trouble in passing a new machine of similar power. It is almost always the machine of 1912 or thereabouts that puts up the best race. It is the same on hills. With a total load of 24 stone and a low gear of 7¾ to 1 I never have any difficulty in climbing Brockley Hill, near Elstree. The other day I waited at the top to watch other machines come up, and I saw several new three-speeders fail altogether, and in other cases the driver had to jump off and run alongside. I also saw a new 4 h.p. horizontal twin fail. On the top of Bury Hill, near Pulborough, Sussex, I was similarly disillusioned. The hill is about a mile long and has rather bad corners, but averages no more than about 1 in 11. I saw only one single-cylinder climb it successfully with a loaded sidecar, and that was a two-speed chain-driven machine at least a year old. The new three-speeders all failed to carry their full load, and there was a weary procession up the hill of passengers who had been shed.

The modern machine with its coachbuilt sidecar and three-speed countershaft gear appears to be a good deal heavier than my three-year-old, which may account for what seems to me to be a poor performance of the former on the road in the hands of the average driver. Certainly there is no inducement to part with an old machine while it is as reliable as ever and can pass the elaborate modern machine both on the level and uphill.

E. C. PALMER.

A selection of questions of general interest received from readers and our reolies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Difficult Starting.

I have a new lightweight motor cycle. Kindly tell me: (1.) How I can make the engine start easily? It starts when I run for about twenty-five yards, but I wish to start it from the saddle. (2.) Would a four-point plug make any difference? It is a single-speed model. (3.) Can I do anything to lessen the vibration of the handle-bars?—C.L.P.

(1.) Difficulty in starting is nearly always due to air leaks at the carburetter unions. If the carburetter union is not absolutely airtight, or the air slides are leaking, you will have difficulty in starting. For easy starting it is necessary to have a strong mixture and little of it. Too small a jet would also cause difficult starting. (2.) A single-point plug is best. (3.) We are afraid you cannot do anything to lessen the vibration of the handle-bars, unless you fit long rubber grips.

How to Climb Hills.

I have a 1910 Triumph. This is the fifth season I have run it. The engine was overhauled by the makers twelve months ago. On ordinary roads it runs splendidly, but on long stiff hills I have to close the air and sometimes ease the clutch. I find in climbing the same hills when I retard it will take them splendidly. Is this the correct way of driving, to retard on stiff hills? Does retarding injure the magneto? Will retarding cause broken valves? The exhaust valve has been running for three years. The cylinder is quite clean and the valves have been ground in. I always take the cylinder off every 1,000 miles.—J.F.B.

It is not uncommon to have to close the air during hill-climbing, or even to slip the clutch on single gear machines, and it is also natural to retard the spark if the engine requires it. Of course, retarding the spark does not injure the magneto, but makes the work easier for the engine. Continual driving on a retarded spark would cause overheating and damage to the exhaust valves; but what you have to aim at is to keep the spark advanced as far as possible, taking into consideration the nature of the road. You must, therefore, use your intelligence, and when the engine shows signs of labouring you should retard the spark slightly, after first cutting down the air supply.

Timing.

(1.) I have a 2¾ h.p. J.A.P. When the engine is starting it blows air back into the carburetter every time the inlet valve lifts. When the inlet valve is in the act of opening, should the piston be at the top of the cylinder or on the down stroke or coming to the top of the cylinder? (2.) When the inlet valve is in the act of lifting, where should the magneto points be? (3.) When the piston head is on dead centre, should the magneto points be closing or opening?—D.M.T.

(1.) The trouble is probably due to too weak an inlet valve spring, causing the valve to close rather late. The inlet valve opens just as the exhaust closes—that is to say, when the piston is at the top of the stroke or just after it has commenced to fall, and remains open for one complete stroke of the piston, or slightly more. (2.) When the inlet valve is in the act of lifting, the magneto points would be about halfway round the contact breaker after having broken, the explosion taking place, of course, at the moment of maximum compression. (3.) When the piston is at the top of the compression stroke, the points should be opening.

Pte. S. A. M Witham, who is stationed at an A.S.C. motor cycle repair base in France. Witham is well known to many of our readers, as he has figured in Brooklands and T.T. races. Previous to joining the A.S.C. he was a member of *The Motor Cycle* staff.

Blowback through Carburetter.

I have a 5 h.p. twin-cylinder motor cycle. Having taken down the engine and cleaned it, I find that it blows petrol through the air inlet hole of the carburetter. Kindly tell me how to stop this.—E.S.

You will almost undoubtedly find that the trouble is due to too weak an inlet valve spring, and if you fit a stronger one you will probably find that the trouble will cease.

Slow Running.

I recently bought a new big twin and sidecar with overhead inlet valves. After running it about twenty miles, I noticed that the inlet valves were adjusted with a great deal of play, the rear valve having a gap of quite $\frac{3}{16}$in. and the front one a good $\frac{1}{16}$in. I consequently adjusted them so that there was a just perceptible amount of slack when the engine was warm. Up till then the machine had been very flexible, capable of very slow running on top gear, and with a good lively acceleration when opening up, and it would take full air practically the whole time. Now it will keep up a steady 25 m.p.h. with the throttle only just open a small amount, and cannot be induced to fire regularly below about 15 m.p.h., nor take any air to speak of, and now and then chokes slightly on hills. The carburetter is a Senspray with so-called 38 jet (it looks smaller). The carburetter slides are working freely and close properly, and the jet and float chamber are quite clear. Do you think the trouble can be accounted for by the valve adjustment, and if so, why should a large gap be necessary to obtain flexibility?—W.A.N.S.

It is a fact that different engines require different clearances between the valve stem and the tappet, but a clearance of $\frac{3}{16}$in. will not allow the full charge to get into the cylinder as the valve does not begin to open until the tappet has travelled the distance named. In other words, if the lift of your tappet is $\frac{5}{16}$in. the valve itself is opening but $\frac{1}{8}$in. You might try the effect of a stronger inlet spring, as, according to what you say, the trouble must be due to the tappet clearances. We should also be inclined to suspect an air leak, probably between the valve stem and guide.

Licences.

In October last year I bought a second-hand motor cycle. Immediately after buying it I paid the Inland Revenue licence, renewing it again on January 1st. I have now bought, through a local agent, a new machine, giving the old one in part payment. Shall I require to pay another Inland Revenue licence, or does the present one hold good for this machine, and will the agent from whom I bought the new machine require to pay the licence for the old one he received from me?—A.T.

The same local taxation licence will do; there is no necessity to take out another. The agent who has taken your machine in part payment will have to take out a local taxation licence for it if he makes use of it.

Overheating.

I have a 2½ h.p. four-stroke engine which was new last year. After running, say, a couple of miles on rising ground on top gear, the power falls off all at once and the machine comes to a stop. If the distance is not too great I can generally get over the hill on low gear. I suspect overheating. After cooling, the engine pulls splendidly. The valve tappets are adjustable, and I have given all the lift possible to the valves, leaving just enough clearance. The compression is good. I use a No. 27 jet in the B. and B. carburetter. The engine will not take full air, but enough. Last autumn I sent the engine to the makers, and they found a broken crank pin; they also fitted a new piston and new tappets. The result was better, but the trouble is not cured. The gear is the Albion two-speed, the standard being 5½ to 1 on top and 10½ to 1 on bottom. Can you help me?—J.L.

The trouble is probably overheating. You might try the effect of a smaller jet, say 26. Also look to the valve springs, and see that they have not lost their temper from overheating. You might also try a slightly lower gear, say 5¾ to 1. Use a good brand of oil and make sure that the engine is getting a sufficient supply.

Purchasing a New Mount.

I am a novice, and am thinking of buying a new motor cycle. I have studied various catalogues and text books, and conclude that a two-stroke would suit my requirements. (1.) Is a two-stroke any good for hilly country? (2.) Is it desirable to have variable ignition on a two-stroke? (3.) Is it desirable to have kick-starter, or would this be superfluous?—B.C.

(1.) The two-stroke machine is quite good for hill-climbing. (2.) Variable ignition is certainly an advantage on any machine. (3.) It is not necessary to have a kick-starter, but a two-speed gear is desirable.

Lubrication.

Will you kindly let me know a suitable oil to use for a 2½ h.p. engine, and how many drops per minute should pass through the Best and Lloyd lubricator for speeds up to 25-30 m.p.h. on level roads? At present I am using Vacuum B.B. Also, I am anxious to know what lubricant to use for an Albion two-speed gear. So far I have not put anything in mine, as it was packed with some kind of grease when I took delivery. As I have since run 800 miles, I think I should be seeing to it again. Any information you can give me will be much appreciated. I should also be glad to know how often the chain from the engine to the countershaft should be lubricated.—J.J.G.

We should say that the oil you are using is quite satisfactory, and we see no reason why you should change. It should run forty to fifty drips per minute up to 30 m.p.h., more if you are travelling faster. The oil in question would do for the gear. This you will find all right in cold weather, but when it gets warm you might inject some grease through a grease gun; do this even now if the oil shows signs of working out. The chain should be lubricated when it shows signs of running dry. The best lubricant is grease and graphite. Clean the chain with paraffin and put it into a flat vessel, warm it over the fire and put some lubricant over it; as this melts it will run into the links. This does not pick up dust like oil does.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"W.D." (Chesterfield).—Grado multi-pulley. General efficiency and belt wear.

"S.D.T." (Cape Province).—A.B.C. model B (T.T.). Speed, power, comfort, and reliability.

"W.W." (Stirling).—Junior Triumph. Easy starting and smooth running at low speed.

"J.C.B." (Berks.).—5 h.p. Indian and A.B.C. Speed, consumption, and reliability.

"G.W.C." (Yorks).—Mabon gear and Grado multi-pulley for use with 3½ h.p. Triumph.

"M.R.H.K." (London).—4 h.p. Douglas, for solo and sidecar work. Comfort, reliability, compression, consumption, hill-climbing (slow and fast). Also Lucas electric lighting outfit and Low generator.

RECOMMENDED ROUTES.

ROMFORD TO SCARBOROUGH.—H.L.T.

Romford, Waltham Abbey, Waltham Cross, Ware, Buntingford, Royston, Godmanchester, Stilton, Wansford, Stamford, Grantham, Newark, Retford, Doncaster, Ferrybridge, Tadcaster, York, outskirts of Malton, Scarborough.

AMPTHILL TO EASTBOURNE; avoiding London traffic.—J.H.C.

Ampthill, Dunstable, Tring, Chesham, Amersham, Beaconsfield, Slough, Windsor, Chertsey, Pyrford, Ripley, Guildford, Cranleigh, Horsham, Cuckfield, Chailey, Lewes, Eastbourne. Approximate distance, 125 miles. It is not the shortest route, but it avoids London traffic.

ROCHESTER TO TORQUAY.—F.H.

Rochester, Westerham, Reigate, Dorking, Guildford, Farnham, Alton, Itchen Abbas, Winchester, Bassett, Totton, Cadnam, Ringwood, Wimborne, Dorchester, Bridport, Lyme Regis, Colyford, Exeter, Chudleigh, Newton Abbot, Torquay.

A meet of the East London (S.A.) Motor Cycle Club. The great predominance of the sidecar machine will be noticed, and it is an interesting fact that half the machines in the group are Triumphs.

SPARKLETS.

Change of Address.

Messrs. G. B. Bartlett and Co., formerly of Kilburn, have now new quarters, these being at 74, Great Portland Street, W.

Catalogues Received.

S.R.O. ball bearings (the S.R.O. Ball Bearing Co., 115, Southwark Street, S.E.). A list of ball bearings of all sizes, single and double row, and of the thrust and journal type.

The Revere Showcard.

A good step in the publicity campaign pursued by the makers of the Revere two-stroke machine is the publication of a well-designed showcard which will appeal to agents. The Revere is made by W. H. Whitehouse and Co., Ltd., of Coventry, in two models, *i.e.*, with or without a two-speed gear.

Where there is No Shortage of New Machines.

Recently one of our North Country contributors paid a passing visit to the motor cycle depot of Messrs. Alexander, Lothian Road, Edinburgh, and in these days of scarcity of supplies he was surprised at the large number of new machines and sidecars on view. The various makes of American machine do not appear to be totally unknown to our friends across the Tweed; but, in addition, samples of the latest productions from the Douglas works were on exhibition, while every variety of Enfield and practically all the leading makes were represented.

The Dunlop Wholesale List.

Motor cycle dealers who have not yet received a copy of the new Dunlop wholesale list of cycle and motor cycle tyres and accessories, which was issued on the first of this month, are asked to send a postcard to Aston Cross, Birmingham, for one. A number of new accessories are listed, such as clip-on motor cycle tyre gaiters, cycle valve tabs, bolt valve plates, and a spare tube bag.

A Good Carbide.

At a time like the present when the demand for really reliable lighting systems is greater than ever, owing to the very necessary light restrictions, and the greater amount of traffic to be met with on the roads at all hours of the night, it is well to bear in mind the claims of Chemico carbide. The makers, the County Chemical Co., Ltd., of Bradford Street, Birmingham, are amongst the largest, if not actually the largest, packers of carbide in the world. The treatment of carbide has been with them a matter of especial attention for many years.

The "Old Timers" Dinner.

The "Old Timers" dinner—a yearly gathering of riders of the old high bicycle and tricycle of the 'seventies and 'eighties—is to be held this year at Frascati's Restaurant, on October 27th. The chairman will be Mr. Shirley Fussell, of the Pickwick Club, who was the secretary of the Hampton Court Meets, of which the last was held some three and thirty years ago. The hon. secretary of the dinner is Mr. W. J. Harvey, Holly Lodge, Gunnersbury, W., who will gladly forward particulars to any who consider themselves qualified as "Old Timers" to attend.

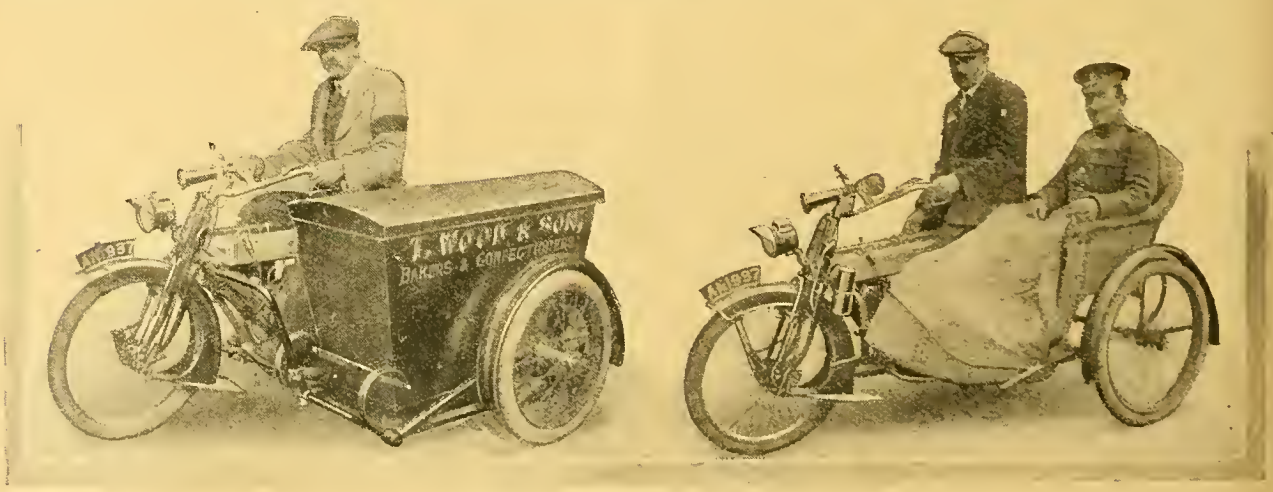
Reviews.

The Enfield Cycle Co., Ltd., has issued a revised edition of the handbook and spare parts list of the 2¼ h.p. Royal Enfield two-stroke. It is a nicely arranged handbook, and the makers will be pleased to send anyone a copy upon writing to the Redditch works. It is gratifying to note that the latest model Royal Enfield is fitted with a British magneto, *i.e.*, the M.L.

We are in receipt of an interesting booklet entitled "Hints for A.C. Owners." Every user of the A.C. Sociable should possess one of these books, as the working of this popular three-wheeler is so clearly explained therein. Particular care has been taken to elucidate by means of line drawings the lubrication system, the gears, and method of adjusting the machine.

Premier (Coventry), Ltd., have sent us a copy of their new catalogue. Even in these days of expensive and high-class catalogues that under review is a remarkably fine production. The Premier range consists of the 3½ h.p. single, 7-9 h.p. twin-cylinder, and the small two-stroke. Of these the latter, with its two vertical cylinders, is most interesting by reason of the many original features embodied in the design.

We have received a copy of a new booklet setting forth the claims of Mex spirit. It is worthy of note that Mex is owned, controlled, and distributed by a British company.



SATURDAY AND SUNDAY SIDECARS.

A P. and M. belonging to Mr. J. Wood, a baker of Bromley, to which may be attached either a sidecarrier or a cane sidecar. As a sidecarrier Mr. Wood finds the machine exceedingly useful in his business.

MOTOR CYCLES FOR SALE.

Alldays.

ALLON, 2-speed, condition excellent, 5 weeks old; take £36; exchange with cash for 1914 Douglas, accessories unnecessary.—C. Wilkin, Wraysbury, Bucks. [4293

ALLDAYS Allon, 2-stroke, new May, 1915, tyres good, lamp, horn, spare belt, chain, and tools, perfect order; £22.—Kay, 118, Pitshanger Lane, Ealing. [4244

Ariel.

ARIELS.—Special agent, Jones, The Broadway, Muswell Hill. Easiest of easy payments arranged. [3994

ARIEL, 1913, 3½h.p., 3-speed, with 1914 coachbuilt sidecar excellent condition; price £37 10.—Kemp, Vicars Lane, Louth. [X7943

1914 Ariel, 5-6h.p., 3-speed, gear box, lamps, accessories, equal new, Millford 1915 coachbuilt sidecar, £72; or with cane sidecar £65; exchanges.—Dosser, Slingsby, Malton. [X9989

ARIEL, 3½h.p., 1914, adjustable pulley, decompressor, powerful, and very little used, new tyres; open to expert examination; £33, or near offer.—Stovell, 16, Alan Rd., Withington, Manchester. [X9727

1913-14 Ariel, 3½h.p., 3-speed, and sidecar, in tip-top condition, 3 lamps, electric horn, new tyres, speedometer, and watch; bargain, £47/10; easy payments arranged.—Jones, The Broadway, Muswell Hill. [2871

ARIEL 5-6h.p. Combination in stock, £90/16, or £23/16/6 down and 12 payments £5/19/2; liberal discounts for quicker payment.—Lamb's, 151, High St., Walthamstow.—Depot 50, High Rd., Wood Green. [4073

A.S.L.

4h.p. A.S.L., excellent condition; £21.—43, Everard St., Crosland Moor, Huddersfield. [X9980

Auto-Wheels.

AUTO-WHEEL and 3-speed Raleigh, splendid condition; £12.—Barry, 16, King's Rd., St. Pancras. [4222

AUTO-WHEEL, B.S.A. Model de Luxe, new tyre, shock absorber; £8.—Gilmour, Stationer, Cupar, Fife. [X9395

AUTO-WHEEL de Luxe, £15/15, or 28/3 monthly; second-hand Wall Auto-wheel, perfect order, overhauled by makers, £10.—Seen at 248, Bishopsgate, London, E.C. [4389

AUTO-WHEEL, attached lady's B.S.A. bicycle, just overhauled; together £15/15, or separate, bargain; owner bought motor.—Celtic Cycle Works, Easthill, Wandsworth. [4174

AUTO-WHEELS.—For easy starting, maximum efficiency, and the limit of economy, order now an Everest carburetter, No. 7, special model.—Write, Everest Carburetters, Coventry. [X9695

Bat.

1914 4h.p. Bat-Jap, 3-speed, and sidecar.—Particulars, Nation, Lympsham, Weston-super-Mare. [X9984

1913 8h.p. T.T. Bat, 90×74½, speedometer, large lamp set, etc., guaranteed perfect; £28, offers.—Empson, Gaulingay, Sandy. [4344

BAT-J.A.P., 5-6h.p. 1913 2-speed twin, with coachbuilt sidecar, new tyres, all as good as new; any trial given; £40.—Carnarvon Arms Garage, Dulverton, Somerset. [X9784

BAT, late 1914, 6h.p., chain and belt, 3 speeds, countershaft, kick starter, lamps, cane enclosed sidecar, any trial given; £55.—Write, Bat, 1, Campbell Rd., Croydon. [X9856

BAT-J.A.P., 8h.p., 1914, perfect condition, 75 m.p.h., lamps, horn, speedometer, tools, spares, new tyres and belt; £40, or nearest.—Lieut. Denning, O.T.C., Fort Darland, Chatham. [X9875

BAT-J.A.P., 1913-14 2-speed 8h.p. Combination, all accessories; £49/10, or £14 down and 12 payments £3/3/4; special discount for prompter payments.—Lamb's, 151, High St., Walthamstow. [4072

1914½ Bat, 8h.p. Jap, spring frame model, chain drive, 3in. Palmer tyres, complete, with Mills-Fulford sidecar (cost £25), hood, screen, Cowey speedometer, lamp set; £58.—Willways, Bristol. [X9816

BAT-J.A.P., 1914, 6h.p., bottom bracket 3-speed, chain drive (new), coach sidecar 1915, all French grey, carefully used by expert, semi T.T. bars, very smart, fast outfit, tools, spares; £65.—Liddell, 20, Denning Rd., Hampstead. [4044

BAT Combinations, new 1915, countershaft models, 8h.p. J.A.P. engines, countershaft, chain drive, 3-speed and kick start, spring frame, handsome 5-point fixing sidecar, with spring wheel and adjustable grid, full of up-to-date features, the combination £98/8/9, delivery from stock; also 4h.p. twin models, solo mounts, 2-speed gear, £60/7/6, delivery from stock.—Wauchope's, 9, Shoe Lane, London. [X9900

Blumfield.

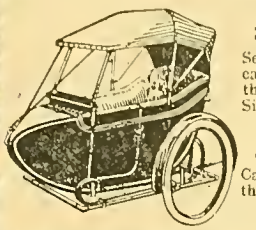
BLUMFIELD, 1915, 5-6h.p., twin, Bowden 2-speed kick start gear, enclosed Bosch, Mark II. Druids, Binks 2-jet, Chater hubs, 26×2½, mileage under 2,000, perfect, reliable, £55; or with coach sidecar £60.—Beeston House, Williams Av., Wyke, Weymouth. [X9941

Bradbury.

1911 Bradbury, 3½h.p., good order; £16.—Harris, Garage, Astwood Bank, Redditch. [X9807

CORONET Sidecar Chassis

is designed for long life, and has a wonderful reserve of stability, and is safe on greasy roads. Luggage carrier built into frame. Cannot shake loose, and is a boon when touring.



£10 15s.

Send for illustrated catalogue describing these well known Sidecars.

EXCHANGES.

Can be supplied through any dealer.

We can give immediate delivery of all models, and suitable for any make of machine.

WE CAN DELIVER FROM STOCK

THE WORLD'S RECORD MACHINE.
THE WORLD'S VALUE MACHINE.

We will make a special allowance for your machine in part payment. Write for terms, as we are large contractors.

7-9 h.p. Harley-Davidson.

The most improved sidecar machine made. Fitted with automatic mechanical oil pump like a car, 3-speed sliding countershaft gear, fool-proof, both hand and foot control to clutch, spring seat, 3in. tyres, silent running engine, will just tick over when in free engine, double stem handle-bar made from rolled cold steel, carrier one steel stamping, spare petrol tank; in fact, refinements not found on any other machine. Full detailed catalogue upon application.

PRICE—7-9 h.p., 3-speed model £68 5
ditto, ditto, electrically equipped £76 13

You cannot beat us on exchanges. Yorkshire dealers supplied.

Coronet Sidecars for Harley-Davidsons.

We make a special Sidecar, enamelled French grey to match, 28 × 3in. tyre, apron to cover entire body, and fourth point attachment £13

BOOTH'S BIG BARGAINS.

2½ h.p. **LEVIS**, 1915 2-stroke model, with 2-speed gear £28 10
3¾ h.p. **PRECISION**, 1912 model, in nice condition £19 10
4½ h.p. **PRECISION**, 1913, 2-speed, and £13 coach Sidecar £31 10
6 h.p. **REX**, 1912, 2 speeds, complete with new coach Sidecar £33 10

Why!

Why buy a machine which CANNOT yield you Perfect Comfort?

That's exactly what you do when you buy a mount minus the Perfect Fork—the

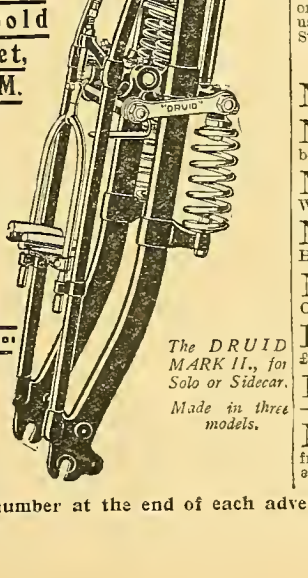
DRUID Mark II

with Vertical and Horizontal Action

—for this is the ONLY Fork which absorbs all shocks WITHIN ITSELF —the ONLY Fork which incorporates the CORRECT "Design-principle," and the ONLY Fork which always yields ideal riding.

NOTE.—If your present mount's "uncomfortable," then fit it with the DRUID MARK II.—'twill smooth out all the road's irregularities. Ask your Agent about it.

A. DREW & Co., Ltd., Leopold Street, B'HAM.



The DRUID MARK II., for Solo or Sidecar. Made in three models.

R.H.S.

1916 Models.

ON the question of 1916 models and improvements, it is as well, perhaps, that a halt has been called for one year, at any rate, in the constant changing of designs which had become almost the recognised practice in the motor cycle world. Year after year manufacturers have racked their brains with the object of introducing something which would attract and appeal to the fancies of the buying public, but in the opinion of many this ruthless changing of design has been overdone. It has been only too palpable that there has been a great deal of changing for changing sake. There is an old adage that "There is a soul of goodness in things evil," and this expression seems very applicable at the moment, as manufacturers are, by reason of the great war in which we are involved, unable to branch out with entirely new models, and have to be content to eliminate those little weaknesses which may have manifested themselves in their 1915 models, and to effect improvements of a minor order.

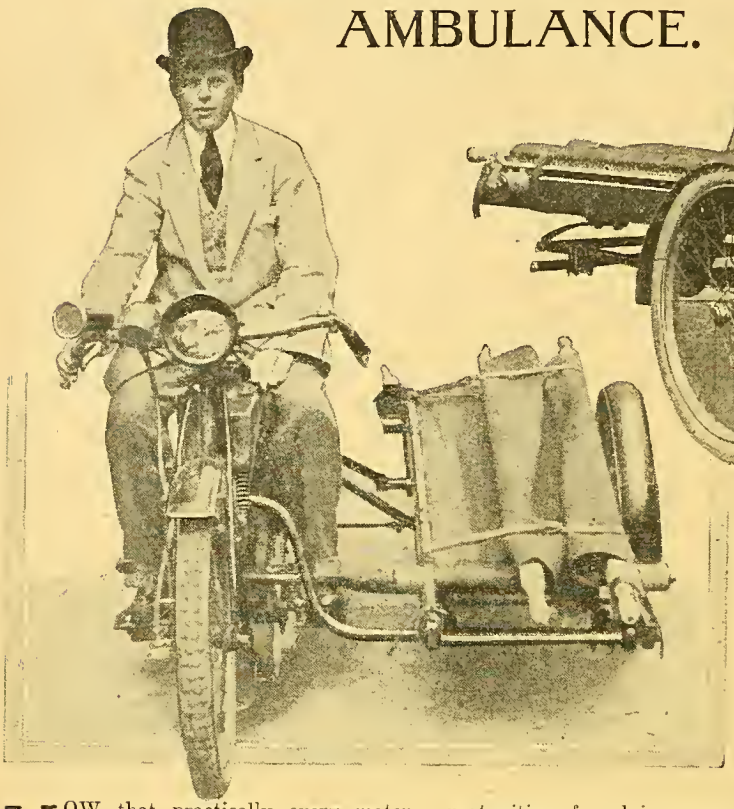
After all, this is to the good. The average motor cycle of 1914-15 is by no means an experiment: in ninety per cent. of cases the machines are such that would tour the world over, though admittedly sundry details might develop trouble, or at any rate recommend themselves for improvement in the light of long experience. This opportunity is being, as it were, thrust upon the manufacturer, and consequently we see good rather than evil in makers having to confine their attention solely to the improvement of details or the cancellation of minor weaknesses which may have developed after a twelve month. To particularise, 1916 may produce no entirely new British design of motor cycle; instead we shall see machines which, to all outward appearances are of 1914-15 design, but which are nevertheless different in reality, and this becomes quickly apparent if one troubles to examine them closely. And, in passing, it may be said that there are few, if any, machines which have yet reached that state of perfection that every detail is beyond criticism.

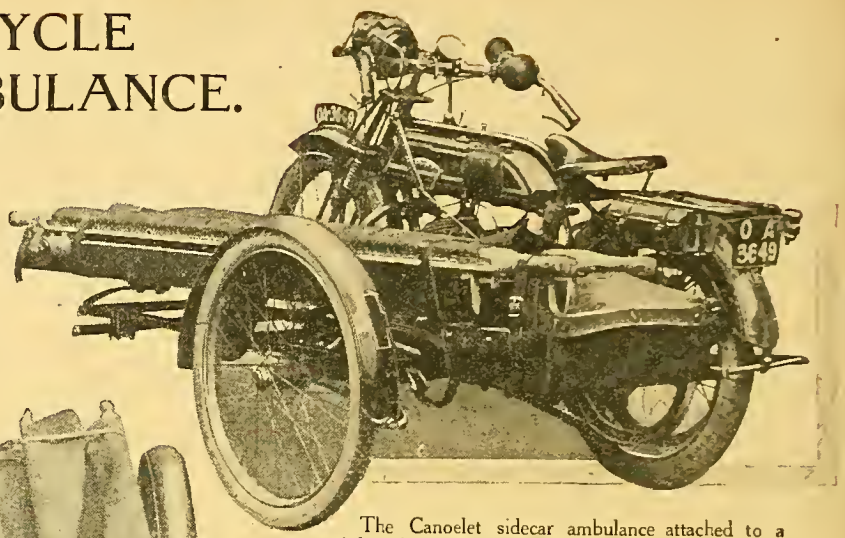
Sidecarriers Exempted from Duty.

THREE weeks ago, in commenting upon the Budget and its possible effects upon the motor cycle industry, we referred to desirable exemptions from the Import Duty. We instanced the fact that, owing to the extensive commandeering of horses used by tradesmen at the commencement of the war, the economical and light motor cycle sidecarrier had, of late, been pressed into an important service. Many of these sidecarriers come from Overseas, and it was plain that a duty of 33⅓ per cent. might have been the means of restricting the growth of the sidecarrier on account of its prohibitive cost. The motor cycle sidecarrier, or parcel-carrier, is unquestionably the most economical form of motor transport, and in the interests of the smaller tradesman who may be using or considering the adoption of a sidecarrier as well as the manufacturers concerned, we appealed to the Chancellor of the Exchequer to include the business sidecarrier in the exemptions he proposed from the 1916 Budget. We are gratified to be able to state officially this week that our recommendation has been considered favourably, and an announcement is forthcoming to the effect that motor cycle carriers intended for use solely for business purposes will be exempt from the new tariff of 33⅓ per cent., which is charged on all pleasure type motor cars, motor cycles, and parts. Though it will be seen from the communication published in another part of this issue that the Treasury has adopted the term "sidecarrier" which we gave to the business sidecar, it may be taken that business tricars such as are commonly seen in the streets of our large cities and all types of "carriers" will also be exempt from the duty.

An index to the advertisements in this issue will be found on the page facing the back cover.

A MOTOR CYCLE AMBULANCE.





The Canoelet sidecar ambulance attached to a 6 h.p. New Hudson bicycle. Mr. R. W. Vaughan, sales representative for Great Britain for Messrs. Mead and Deakin, is driving.

NOW that practically every motor cycle maker is busy with war work in one form or another, it is interesting to find that those making sidecars are not neglecting opportunities of evolving some form of war machine other than the gun-carrying sidecars so well known in connection with the Motor Machine Gun Service.

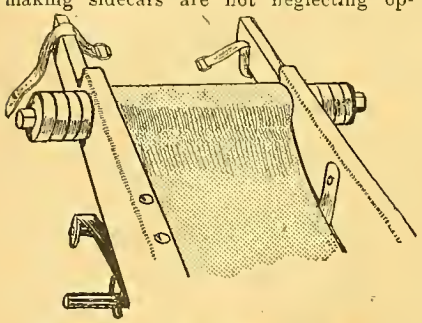
The Canoelet Ambulance sidecar, manufactured by Mead and Deakin, which we illustrate on this page attached to a 6 h.p. New Hudson motor bicycle, is not the makers' first attempt to provide a light handy vehicle for the requirements of the Red Cross. Though not intended for use in Flanders, as the road surfaces preclude such a combination, it is felt that the sidecar ambulance has great possibilities for home use.

Sidecar is really a misnomer, as there is but a tubular frame mounted on a sidecar axle, while above this frame is one of stout wood, and attached to this is a strong fabric sheet.

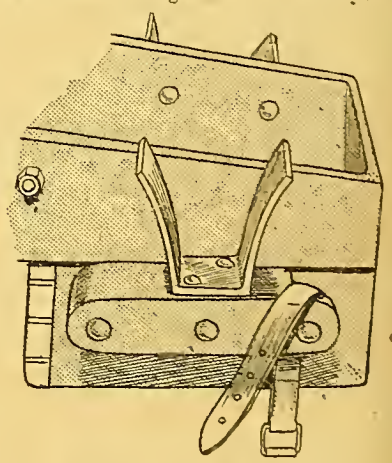
At the head is a box for the man's kit or ambulance stores, while the regulation stretcher fits into special brackets at the head and over rubber buffers at the tail, straps being used to secure the stretcher in place.

When folded both bars of the stretcher are strapped to the wooden frame and cannot rattle.

The illustration shows the rigidity of the whole, no fewer than four tubes tying the stretcher carriage to the motor bicycle.



Rubber buffers on Canoelet ambulance frame. On these buffers the stretcher rests at the front.



Rear spring steel clip for rest of standard stretchers on Canoelet motor cycle ambulance.

DESPATCH RIDERS ATTACHED TO AN R.E. SIGNAL COMPANY WITH THE CANADIAN FORCES IN FRANCE

Sergt. E. T. Cousins, in sending us the photograph, says a gramophone and a few records would be very much appreciated by these men for the coming winter months.

OCCASIONAL COMMENTS.

By "IXION."

Electric Lamps for Lightweights.

Not long ago a courtesy trial of an electric dry battery lighting set on a "baby" two-stroke set my pen wagging rosily in praise of the combination: and, being a consistent man, I specified an outfit of the type for my winter pottering. I have now enquired into prices, and, though they do not tot up so alarmingly as a dynamo might, they are a little steep in proportion to the cost of the two-stroke they are desired to adorn. For example, one maker charges £2 13s. 6d. for the set I deem sufficient, and another quotes £3 1s. 6d. for a similar outfit, each set including, of course, a substantial tail lamp with a separate battery. Even at these figures the outfits strike me as desirable, and I am purchasing. But I wish to correct my former paragraph in so far as it may have implied that these sets should have the preference over light and cheap acetylene outfits, which are procurable at about half the cost of these electric equipments. While I am on the subject of lights, I may add that the Low generator is now being commercially manufactured in the motor cycle size, and that it has been improved by the substitution of stronger metal for the top compartment, and by the removal of the water filler from the inside to the outside of the device.

The Four-cylinder Henderson.

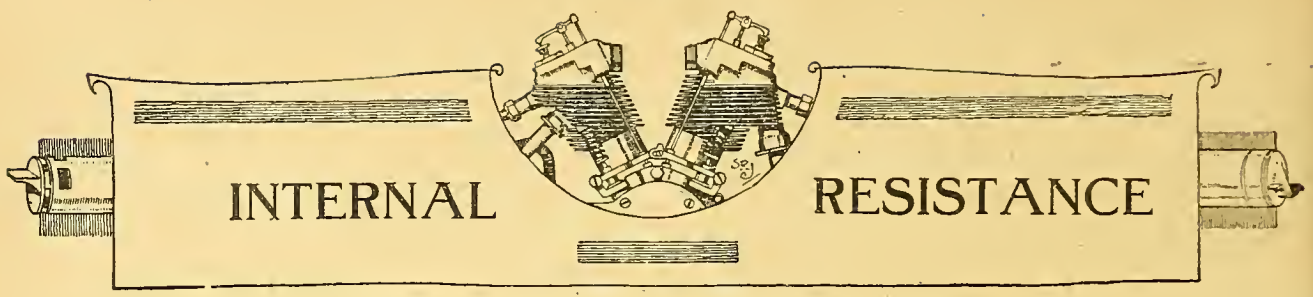
In common with other members of the staff I have been sampling the paces of the four-cylinder Henderson, which has provided me with quite a new sensation. True, I had ridden many miles on a four-cylinder F.N., but it was disfigured at that date by automatic inlet valves, and by a transmission (the shaft drive) which impressed one overmuch with its rigidity whenever the four little valves chose to function irregularly. By contrast, the Henderson has mechanical inlets and a chain drive, with a fine clutch interposed between itself and the engine. In brief, I can only compare the experience with that of handling a leviathan Grand Prix racing car, for the powerful engine never asks for its emergency gear, and accelerates from an inaudible crawl to a thunderous roar in response to the movements of the single carburetter lever. Also, it can behave like a docile baby two-stroke in thick traffic, for it can be throttled down to seven or eight miles an hour on top gear, and to three or four miles an hour on bottom, and will accept its clutch on either gear without further throttle opening, so sweet is the pick-up of its clutch. If your riding companion's tank is empty, you need not trouble to stop your engine outside a petrol store; the engine will tick over silently in neutral at a paltry rate of revolution, and does not get hot in the process. The acceleration is absolutely terrific—there is no other word for it; and the gamut of the engine is surprising, for whether you elect to drive at 10, 20, 30, 40, or 50 m.p.h., the engine responds cheerfully.

The Control of a Four-cylinder.

I believe that the four-cylinder engine will have a big future on two-wheelers (still more so on three-wheelers, perhaps), but its progress will be hampered unless its designers sympathise with the conservatism of motor cyclists, and supply a control with which we are familiar. For example, the vital items of the Henderson control consist of (a) a throttle adjusted just *not* to shut, as all good throttles should be; (b) a switch half-way back along the top tube; and (c) a handle-bar clutch lever (though, I fancy, the standard machine has a side lever clutch control only). Years of practice have accustomed us all to a machine which can be stopped "from the handle-bars" by means of a valve-lifter, and I confess to some exciting moments in the thick Coventry dinner-hour traffic, until I had realised where everything was. It is never easy to operate handle-bar clutch controls in a jiffy—they are necessarily short of leverage, and require a lot of muscular effort. A valve-lifter is not easily arranged where four valves have to be lifted, though one would think that a pedal exhaust valve lifter would be just the goods for a machine of this type. In its absence, the designers would do well to adjust the throttle to the stopping point, or, alternately, to fit a handle-bar switch of a substantial character.

The Grease is Coming.

One feels almost ashamed of mentioning the troubles of a motor cyclist on grease when one thinks of the mud in Flanders. Still, we are dealing with a national industry, and with riders less practised and heroic than the "D.R.," so a reference is pardonable. When I reflect how many riders funk greasy roads so completely that they lay up their machines for the winter, I feel sure it will pay the trade to work on the lines of the Carden and Aviette light, cheap, motor cycle four-wheelers; there are thousands who want a non-skid winter mount who will never be able to afford a car, and who eternally lack the nerve to straddle a two-wheeler. "There's nowt so queer as foak!" they say up north, and I remembered the adage recently when a wild youth drove me at thrice legal limit in a ricketty 8 h.p. sidecar outfit, and then refused to try my two-stroke on the ground that two wheels are always dangerous! Between the "tinker" who sticks to three and four wheels and the despatch rider who holds a two-wheeler up in the equivalent of six inches of soft soap there exists an intermediate class who want the steadiest two-wheelers in existence for their winter work. The vital factors distinguishing for this purpose machines equal in all other respects are the elasticity of the drive and the evenness of the torque. A single-cylinder with a rigid drive is the worst skidder of all, though a clever rider may scorch through a Devon winter on one without fear or fall. A multi-cylinder with a non-rigid drive is the steadiest winter mount of all with one exception, namely, the belt-driven baby two-stroke, which adds extremely light weight to the other desiderata of even torque and elastic drive. I grow more timid with advancing years, and I have got to the point when I can just hold up a chain-driven single-cylinder when there's no alternative; but I always pick a belt-driven "baby" for a greasy run, supposing my stable contains an example. To this judgment I append a note in favour of the four-cylinder; its length and weight are unpromising, but the complete absence of all snatch in the grip of the back tyre on the road results in most steady travel over slippery roads.



INTERNAL RESISTANCE

HOW CAM DESIGN AFFECTS POWER.

MOST motor cyclists are aware that the power developed by an engine is lost in several ways. Power, for instance, is absorbed in the transmission, a considerable amount being taken up by such fittings as countershafts, chains, and belts. Power also is absorbed by wind resistance, by up grades, and rough surfaces, but few riders have any idea of the amount of power taken up by what is known as internal resistance. Curiously enough, the very medium which we use to eliminate friction causes friction and loss of power on its own account. We all know that when the oil is poured out of the tin into the tank on a winter's morning it is thick and of the consistency of treacle; it stands to reason, therefore, that its effect upon the flywheels, bearings, and piston is of a most distinctly retarding nature. The same oil which has been poured in, after a few minutes' running becomes rapidly liquid, and is of just the right consistency to allow the moving parts to revolve freely.

Fluid Friction.

Some interesting experiments have been carried out by Messrs. J. A. Prestwich and Co., which show how the viscosity of the oil influences the h.p. absorbed by internal resistance. The experiments were carried out by driving an 8 h.p. side valve twin J.A.P. engine at 1,000 r.p.m. by means of a belt from the shafting. The normal quality of Vacuum B oil was put into the crank case, and the horse-power absorbed was read off by means of a dynamometer. When cold the viscous condition of the oil resulted in 1.3 h.p. being absorbed, while after eight minutes the actual friction set up by the moving parts raised the temperature to 85° Fahr., and the horse-power dropped to .907. This test was carried out with the valve caps removed. The next test was with the valve caps in place, and the throttle fully open, and the reading was then taken under the following conditions, and the following figures were shown:

Two compression taps closed	1.3 h.p.
One compression tap open	1.42 h.p.
Two compression taps open	1.58 h.p.
Throttle closed	1.52 h.p.

It is interesting to note that the greatest amount of horse-power was absorbed when both compression taps were open, which goes to prove that, as we have previously pointed out in these pages, over a certain engine speed compression has no retarding effect upon the engine; in fact, the power necessary to overcome the compression is always partially given back on the rebound—that is to say, that once the compression has been overcome, the expanding air helps the piston to descend. With the compression taps open, on the other hand, the assistance of the compression is not obtained, and we merely get the power taken up by the actual friction of the moving parts and of the air which is forced through the small tap.

Another interesting experiment was to record the amount of power absorbed by the oil only at varying temperature. It will be seen from the table below that the pull in pounds decreases, and the horse-power also decreases as the temperature of the oil rises, the temperature being taken from an oil well drilled in the crank case lug.

Temperature.	Pull. lb. oz.	H.P.
60°	7 0	1.84
62°	6 0	1.57
64°	5 0	1.31
74°	4 12	1.25
76°	4 8	1.18
78°	4 4	1.11
82°	4 0	1.05
84°	3 14	1.0
88°	3 12	.98
92°	3 10	.95
100°	3 8	.915
108°	3 6	.87
110°	3 4	.85
118°	3 3	.83
122°	3 2	.82
128°	3 0	.785
130°	3 0	.785
140°	3 0	.785
180°	3 0	.785

H.P. = Pull × .262.

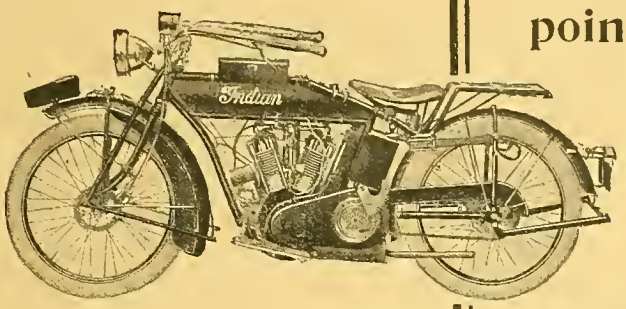
The curve showing the variation of internal resistance with the rise in temperature is also most interesting.

Another source of internal resistance is in the magneto. The actual transmission losses in driving the magneto are quite small, but considerable effort is required to overcome the pull of the magnets. Years ago, when magnetos were first placed upon the market, it was thought that about ¼ h.p. was actually taken up by the magneto. After various careful tests had been made, it was found, however, that .03 or $\frac{1}{32}$ h.p. was absorbed by the average magneto, though one showed .05 or $\frac{1}{20}$ h.p.

Resistance of the Timing Gear.

Having considered the internal resistance set up by the oil and the magneto, we will now turn to that absorbed by the most important moving parts of the engine. These are in the timing gear. First of all it is necessary to consider the various types of cams used, and their approximate contour is shown in the accompanying drawing. Before dealing with the cam gear losses, it is necessary first of all to say a few

Specialisation :



One of the cardinal points of efficiency in motocycle construction is specialisation

—and that is the secret of the high pitch of perfection to which Indian motocycles have been brought.

We do not manufacture cars, all our resources, our ingenuity and energy are concentrated upon the evolution of the World's Best Motocycle. That we have been highly successful is evinced by the amazing popularity of the silent Indian.

Ariel

In answering this advertisement it is desirable to mention "The Motor Cycle."

Internal Resistance.—

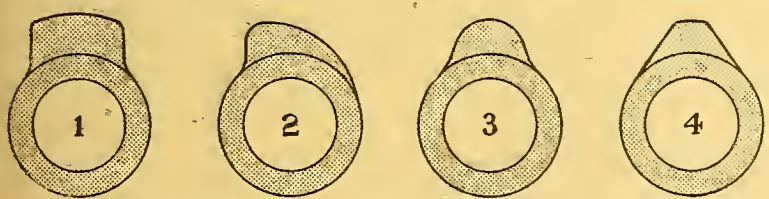
words about the four different cams illustrated. No. 1, it will be seen, is a cam which permits the valve to be quickly lifted, and also allows it to fall away with equal rapidity. We therefore get rapid opening and rapid closing, and a fairly long dwell. This type of cam puts an immense strain upon the valve, and is also extremely noisy, as the rapid fall of the valve head brings it into violent contact with the seating, consequently a loud clatter is set up. This cam involves the use of abnormally strong springs, but it is efficient, as to get speed it is necessary for the valve to open quickly. No. 2, it will be noticed, affords this rapid lift, but as the back of the cam is gradually sloped away the fall is comparatively slow; there is consequently less strain on the valve gear, and it is much quieter. There is a possibility, however, of the valve bouncing at very high speeds, and under a 40 lb. spring the valve has been known to jump as high as $\frac{3}{16}$in. Dr. A. M. Low has made some interesting experiments in observing the action of valves by means of a cinematograph with a synchronised shutter. No. 3, a round-nosed cam, is a compromise, giving a more gradual opening, and equally gradual closing. With this type of cam not quite so much speed is obtained, but for road use it gives a more modified opening and sufficient power. No. 4 is a very good shape, known as the tangent cam, and is one of the oldest designs of cams in the history of the internal combustion engine. It is one of the most silent, but does not lend itself to giving the maximum amount of power.

The Effect of Different Cams.

The following table, which shows the results of tests with an 8 h.p. s.v. engine running at 2,000 r.p.m., gives a clear idea of the amount of power absorbed by the four different cams referred to, with plain lever and with roller lever.

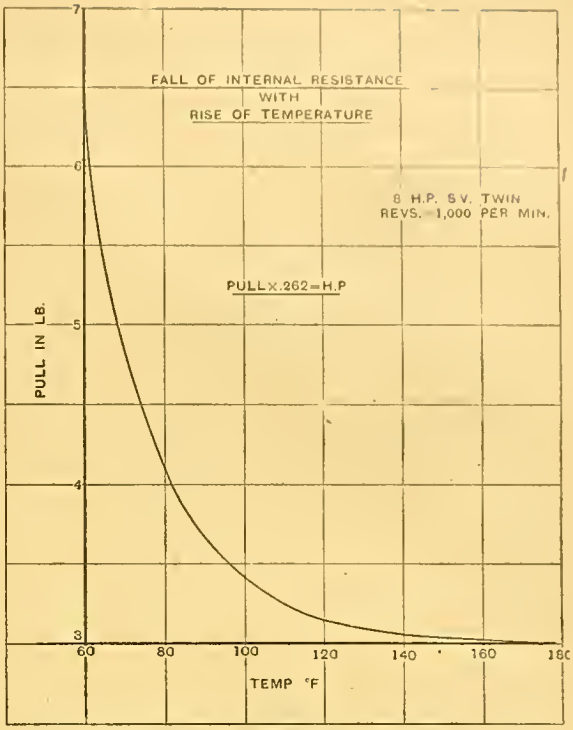
	Cam			
	1	2	3	4
H.P. (plain lever) ...	.238	.183	.151	.123
H.P. (roller lever) ...	.214	.174	.143	.095

The introduction of rollers on the cam levers reduces the loss of power, but this is more noticeable in the case of the tangent cam. The fact that the loss is not so marked with the quick lift cams is due to the bouncing action which this type gives to the lever, and this also accounts for the extra noise in the gear. The greater part of the noise, however, is due to the quick drop of the valves on their seats, and the bouncing of the cam lever and tappet at the normal of the cam when using the racing type.



A diagrammatic drawing of four types of cams. The contours have been exaggerated so as to give a clearer idea of the different styles mentioned in the letterpress. The cams revolve anti-clockwise.

The present design of the valve gear in the J.A.P. engine is the result of much experimenting on the part of Messrs. J. A. Prestwich and Co., who now have a combination under test which is almost noiseless, and will allow an 8 h.p. twin engine to run freely at 250 r.p.m., while, at the same time, it can be made to accelerate to over 4,000 r.p.m. under load.



Graph showing how the internal resistance falls when the temperature rises, and so causes the lubricating oil to become more volatile.

Cooling.

Some interesting experiments have been made to test the efficiency of various cooling arrangements. It is well-known that the larger the amount of surface presented to the air, the more rapid is the cooling, and designers, to obtain the best results, have placed on the market extra aluminium fins to interpose between the existing radiator fins, and these certainly have a most excellent effect. Aluminium, being a light metal, does not increase the weight to any appreciable extent, and is also an excellent radiator of heat. Curiously enough, practically the same results can be got by interposing coiled wire between the radiating fins. If this is carefully and intelligently done the cooling is greatly assisted. Tests of both methods were made by volatilising a small quantity of oil placed in a well made in the top fin of the cylinder, and taking the time occupied by the oil in evaporating.

THURSDAY, NOVEMBER 25th!

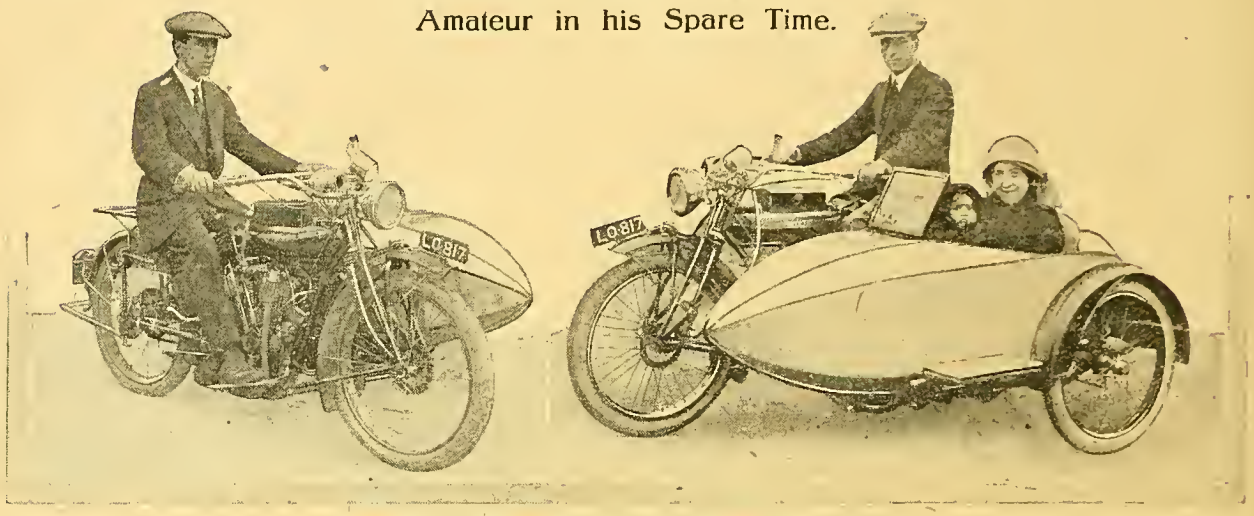
THE MOTOR CYCLE

BUYERS' GUIDE OF 1916 MODELS.

This issue will be considerably enlarged and will contain an illustrated review of the various new pattern motor cycles.

The Cult of the Home-built Sidecar.

An Attractive Body made by an Amateur in his Spare Time.



AN ATTRACTIVE ALUMINIUM SIDECAR BODY.

Mr. and Mrs. F. T. White and their Indian sidecar outfit. The fine aluminium sidecar body was designed and built by Mr. White himself.

THE plan of building one's own sidecar appears to be spreading among keen amateurs lucky enough to possess small workshops. Some of these home-made affairs bear a distinct "home-made" stamp about them, whilst others are indistinguishable from the factory article. In the latter category must be placed the sidecar built by Mr. F. T. White, of Burghill Road, Sydenham, and illustrated on this page. Not only is Mr. White's sidecar pleasing to the eye, but the design is good and the fittings embody interesting features. It is fitted to a 1915 Indian, and Mr. White built it during his leisure hours last winter.

Details of the Body.

The body is 6ft. overall, and is built up on an elm framework, covered with three-ply wood (⅛in.), and then polished aluminium. The seams are of angle aluminium painted Indian red. Rear springing is internal and adjustable to suit weight of passenger. A good point is that it is so arranged to permit slight rolling of the body, thus the passenger is enabled to cause the body to lean the correct way when cornering.

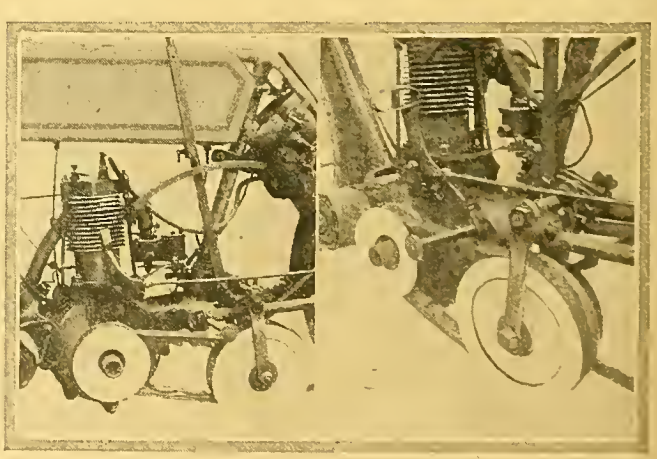
The front is supported on three coil springs; the weight of the passenger is *not* carried by the body itself, but by two specially-shaped ⊥ iron members, to which the front and rear springs are attached. In the body is fitted a speedometer, which is illuminated by a small electric lamp. The inside of the body is illuminated in the same manner as well as by reflected light.

The woodwork inside the body is varnished with the exception of the roof, which is white enamelled and serves as a reflector for a small lamp.

At present only a temporary windscreen is fitted, in order to provide a little protection for Mr. White's baby girl (one year), who enjoys a ride sitting on her mother's lap.

The chassis is by the Phœnix Co. A grey cloth upholstery is used, and the seat and back cushions are loose.

Since last June Mr. White has covered 3,000 miles, including a tour of the Lakes and Yorkshire moors. During this distance the body has given every satisfaction, and has proved most comfortable over the worst roads. At the same time Mr. White pays a tribute to the 7 h.p. Indian bicycle, which has given as much satisfaction in its sphere as the sidecar, and he says that he is afraid he cannot go back to a rigid frame, after having once tasted the delights of rear-springing.



A DOUBLE EXPANDING PULLEY GEAR IN USE.

Double expanding countershaft pulley gear fitted to an early pattern machine. The owner is Mr. Louis Dugdale, a letter from whom on the subject appeared in our correspondence pages in the issue of September 16th. The left-hand view shows the top gear of 4½ to 1 engaged, while the right view shows the 12 to 1 bottom gear engaged. The belts are of chrome leather, and the pulleys run on Hoffmann journal bearings fitted with dust caps.

The men in Khaki and — THE CLYNO.

That they need it, the Government demands—insistent and continuous—are ample evidence—

To fill their need is the one and only purpose on which we concentrate to-day.

Every nerve, every energy, every man, every machine, every tool, every facility — all are working to produce the CLYNO MILITARY COMBINATION as rapidly as possible for—

We must not fail "the men in Kkaki" while they fight our battles.

In the meantime the Clyno is proving, under tests more arduous than any peace-days could provide, its merit and efficiency—adding to its reputation daily—proving beyond dispute that even if you have to wait it is indeed worth waiting for!

So keep in touch.

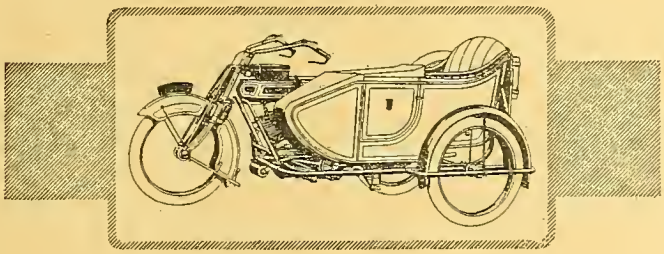
TELEPHONE—992, Wolverhampton. TELEGRAMS—"Clyno, Wolverhampton."



REGISTERED TRADE-MARK.

NEW-HUDSON

MOTOR CYCLES.

Enduring Satisfaction is only derived from the Motor Cycle which is produced in a factory where expert knowledge, thoroughness, and perfect organisation prevail.

Comfort, Convenience, and restful enjoyment of Motor Cycling depend upon the skill of the designer and the scientific selection of material no less than on the care of the builder.

The New-Hudson combines these qualities in a degree unequalled. Once you own a New-Hudson Motor Cycle, you will not be satisfied with any other.

The name is a guarantee of that reliability for which New-Hudsons are famous both in peace and war.

New Models and Catalogue for 1916 will be ready in January next, and we invite enquiries for next season's deliveries.

ELOQUENT TESTIMONY.

Grenville House, Blackpool.
April 29th, 1915.

Dear Sirs,—I have now run your 6 h.p. sidecar combination IX.B about 600 miles and am even more pleased with it now than I was on delivery. I do not consider your advertisements and catalogues quite do the outfit justice. Advertisers quite commonly exaggerate a little, whereas careful examination proves your machine is better than its specification. I find little improvements, refinements, even luxuries have been added for which no extra payment has been demanded. The engine is a most flexible one, it accelerates on the level or on hills very smoothly, yet quickly, and its slow quiet running on top gear in traffic is a remarkable feature. I have tested it for speed on quiet moorland roads and for power over the Lake District hills with most satisfactory results. I want nothing better and I doubt if there is a better engine for one who must have power and reliability combined with low running cost. The sidecar is the best I have had so far, and I have owned eight combinations, while my wife's opinion of its comfort is emphatic. The fittings are very strong and its alignment perfect. My satisfaction is so great I felt bound to write you.

Yours truly, WALTER HOWARTH.

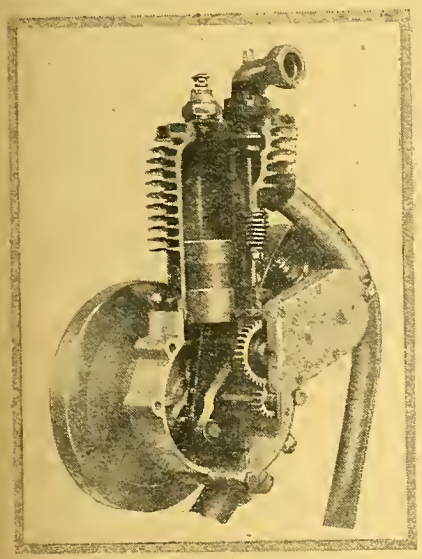
THE NEW-HUDSON CYCLE CO., LTD., Parade Mills, Birmingham.
London - - - - 43-45, Gray's Inn Road, Holborn.

NEW MODELS

· MANUFACTURERS' PROGRAMMES FOR 1916 ·

THE J.E.S., A TRUE LIGHTWEIGHT.

THE J.E.S. motor assisted pedal bicycle is sold as a complete machine. The engine, which is rated at 1 h.p., has a bore and stroke of 51 × 57 mm. (116 c.c.), and has



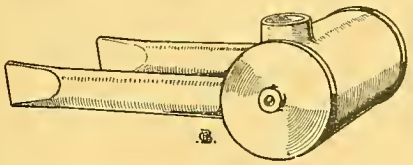
Section of the J.E.S. miniature engine, which has an automatic inlet valve.

an automatic inlet valve. The gas is supplied by a J.E.S. automatic carburetter and ignited by a Dixie magneto. The tank capacity is threequarters of a gallon, which with so small a motor should suffice for upwards of 100 miles. The drive is direct, and through a ½in. belt. The machine is fitted with Dunlop 26 × 1¾ tyres, and weighs 73 lb. complete.

The J.E.S. is probably the lightest machine in existence. The maker has improvements on the *tapis*, but Government work has delayed their appearance.

NEW RYDER TWO AND FOUR STROKES.

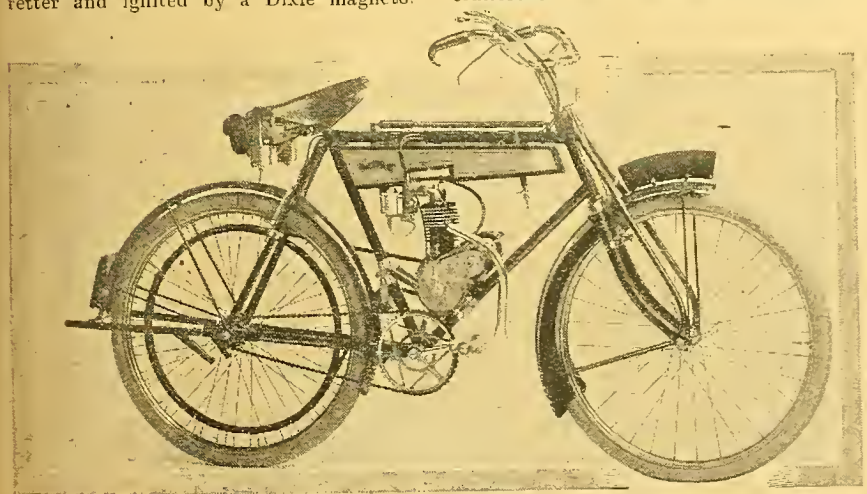
THE New Ryder programme for 1916 is to remain unaltered. Ladies' and men's models will be listed, each of these being obtainable with either a single or two-speed gear. There will also be a four-stroke model with a 2½ h.p. J.A.P. engine and



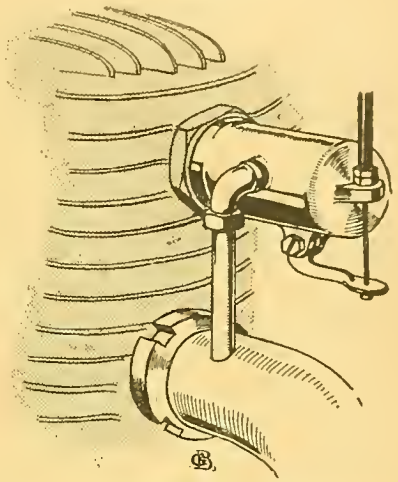
Silencer of the two-stroke New Ryder.

two-speed countershaft gear. The latest model two-stroke engine is fitted with a release valve, which has a connection to the exhaust pipe, as illustrated. The piston is provided with oil grooves, and two rings are placed at the top.

A short run on the single-geared model showed that the machine was distinctly comfortable and free from vibration.



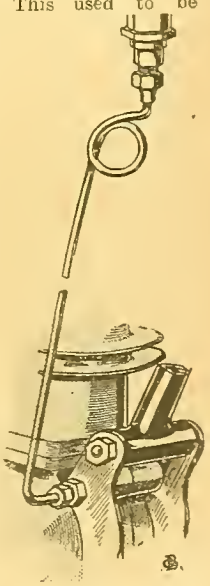
The 1 h.p. J.E.S. lightweight motor cycle



The New Ryder covered in release valve with pipe to exhaust.

REVERE IMPROVEMENTS FOR 1916.

TWO models of the Revere two-stroke machine will be marketed next year, a single and a two-speed model. The general design will be as before, though a few details have received attention; among them is the oiling system. This used to be carried out from a pump to the inlet pipe. On referring to the sketch of the new system, it will be seen that a pipe leads from the pump to the crank case, the bolt for the engine hanger being drilled out to receive it. To improve the weatherproofing of the machine it has been decided to introduce black enamelled rims in lieu of the usual plated ones. A point about the single-speed model is that no alteration is required if it is desired to fit a two-speed gear box, ample accommodation for which is provided

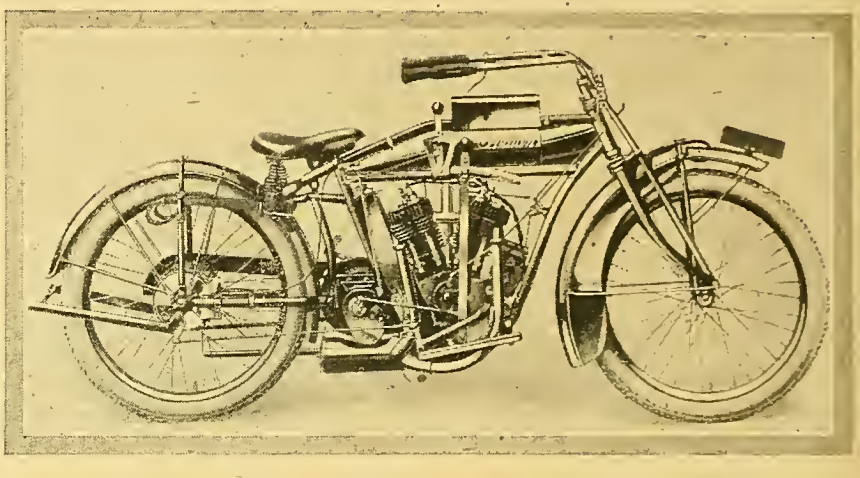


The new oil inlet on the two-stroke Revere;

Side-by-side Valves on 7 h.p. Indian.

PRACTICAL TEST OF THE NEW LONG STROKE, SPRING FRAME MODEL.

IN our last week's issue we described in detail the new Indian lightweight, which is, perhaps, the greatest innovation introduced by the Hendee Mfg. Co. for the coming year. There are, however, several improvements in the firm's other models to be dealt with. The most important of these is the introduction of the 7 h.p. side-by-side valve engine, which is fitted to models G and F. Although only just placed on the market, it is an engine with which the Hendee Mfg. Co. have been experimenting for the last three years, during which time it has received testing for some 50,000 miles, so that intending purchasers may now be certain that it is a thoroughly well tried article. This year the bore and stroke have been altered. Formerly the 7 h.p. engine had a bore of 82.5 mm. and a stroke of 93 mm., whereas the 1916 engine is a real long stroke model with a bore of 79 mm. and a stroke of 101 mm. This gives a smaller capacity, being 990 c.c., as against 994 c.c. last year.



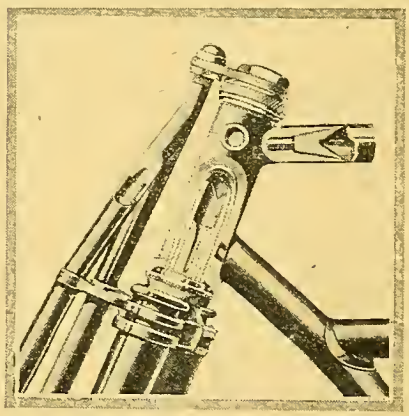
The new 7 h.p. long-stroke three-speed Indian, the equipment of which includes spring frame, magneto generator, and lighting set.

A Novel Compression Release.

The timing gear is now carried in a separate casing forming part of the crank case casting, and a clear idea of the arrangement of the distribution gear wheels is shown in the accompanying photograph. A small pinion driven off the crankshaft drives by means of helical gearing the tiny plunger pump at the base of the crank case, which serves to maintain constant level of oil therein, thus taking the lubrication out of the hands of the driver. The method of releasing the crank case compression is distinctly novel. The air passes through a rotary valve contained in the shaft of the first of the train of pinions, which drive the magneto, into the timing gear case, thence it emerges through an ample breather pipe which carries any surplus oil away to fulfil a useful purpose—the lubrication of the front chain.

The tappets and springs are protected by means of telescopic sheaths, which effectually exclude dust from the tappets, and, consequently, these should last very much longer in the new models.

To remove the valve, it is only necessary to release the bottom nut from the sheath and push up the lower portion.



Section of the reinforced steering head lug used on the 1916 Indians.

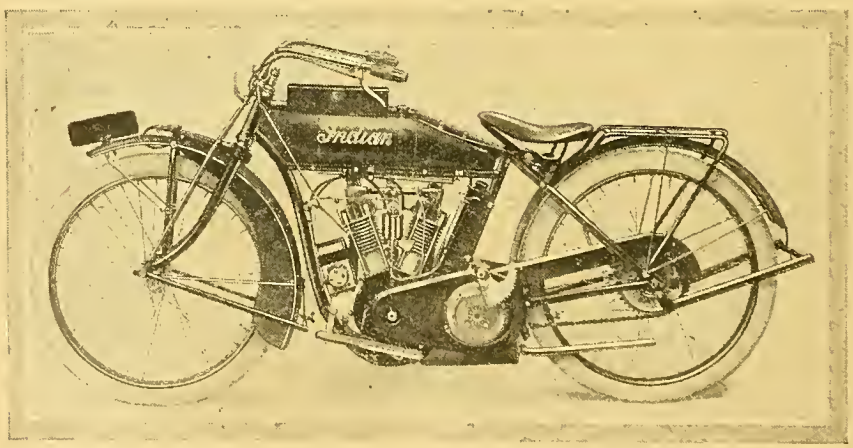
This exposes the valve collar, and if this latter is raised a small crescent-shaped disc can be removed, and the valve can be then withdrawn. This crescent-shaped disc takes the place of the ordinary cotter, and, as the washer is recessed to take it, it is perfectly secure. The valve sheaths do not extend for the whole length of the valve stem, but reach as far as a separator in which slots are cut, which serves to cool the valve stem and allows sufficient air to reach the spring. The valves this year are of ample dimensions, and the washer underneath the valve cap is recessed in the cylinder casting; consequently there should be no difficulty whatever about keeping the joints gastight. To revert again to the new arrangement of the valve gear. This, we may mention, is a radical departure from former Indian practice, and, beyond allowing the timing gear to be easily accessible, it allows for wide roller bearings for the connecting rod big ends, while the gudgeon pin and crankshafts are larger than ever before. The mainshaft bearing on the off side of the engine is of the roller type.

The "Powerplus" Engine.

The new L head engine with one piece cylinder is exceptionally efficient for its size, and, although it is rated nominally at 7 h.p., on an actual brake test it has shown from 15 to 18 h.p.

The new gear box, which we described on the occasion of our reference to the lightweight model, will be embodied in this and the other Indian machines. Other excellent features of the model F, such as the spring frame, spring forks, and disc clutch, which can be operated by hand or foot, are retained. The photograph showing the construction of the front fork is worth careful examination, as it shows the laminated head stem, demonstrating the extraordinary strength of this important portion of the frame.

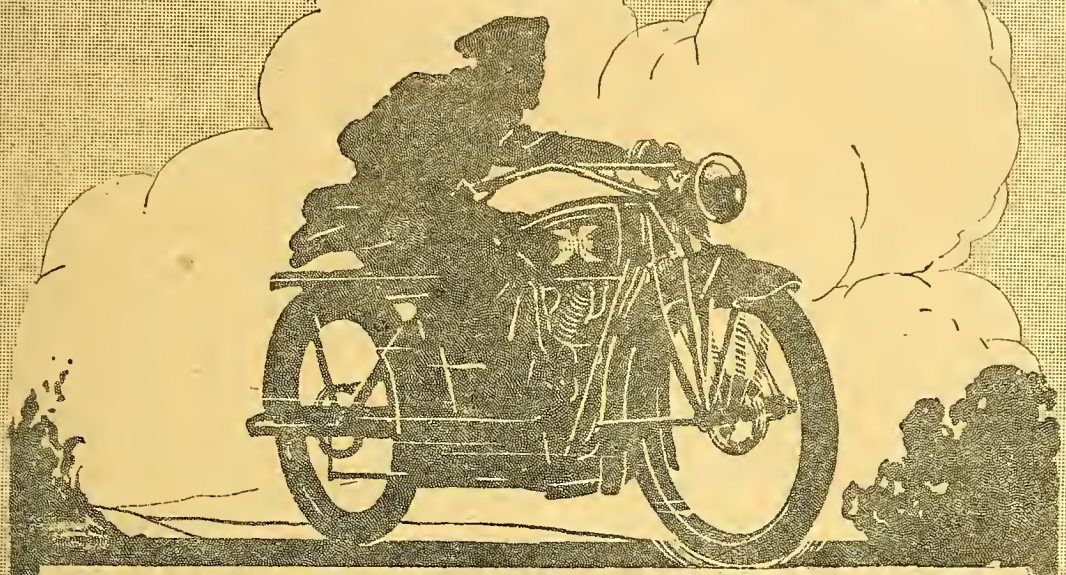
In writing this description we have had before us the model F, which is the type



1916 model 5 h.p. twin Indian, which has a rigid frame and overhead inlet valves.

The AMERICAN EXCELSIOR

America's Best Auto-Cycle



"Some" Speed!

IN a 300 mile race at Chicago last month, the American "Excelsior"—"The Good Old X"—beat all other makes, and won in 3 hrs. 29 mins. 51⅖ secs. —a speed of 85.71 miles per hour.

Think of the strain on the machine! A sprint of 85 m.p.h. would be wonderful enough—but to keep it up for 300 miles . . . . . ! It shows what the "Good Old X" is made of.

You want a machine ready for anything—which revels in tough jobs—which will never let you down—which "always makes good." Come and inspect the "Good Old X"—the American Excelsior.

ADVANTAGES. By carrying a spare tube you can—

Replace tube in five minutes without unscrewing a nut on the machine. Repair at your convenience. Put a patch on the inside with ordinary rubber and solution which never shifts or leaks; no expensive prepared patches required, thereby saving time, trouble, and expense, also prolonging the life of tube and cover. No friction of patch on canvas of cover. Take the valve out and replace from the inside without interfering with valve seating. (All tubes are valve seated on the inside). Turn tube inside out like a stocking by taking the valve out. Take tube to the water for testing without taking machine.

FIRST IN 1904, FIRST ever since. GUARANTEED AIR-TIGHT.

PRICE LIST.

Pedal Cycle, 1¼, 1⅜, 1½in. .. 6/-

Don't go by the first cost, but by the money you save in using them.

WHY they are the BEST and CHEAPEST

BECAUSE—They are made of the **best** rubber and of substantial thickness. Have free passages of air, and **no** butt-ends to burst. Save you hotel and train expenses. Enable you to keep an appointment. No need to repair by the roadside and keep your friends waiting. Last longer than any other tube. Save your tyre bill.

Don't spoil your Tour by delay with punctures. Carry a Spare.

If you cannot obtain them from the Trade, write direct. Sent per return post.

Further particulars, write for booklet.

How's this for Satisfaction.

Bristol.

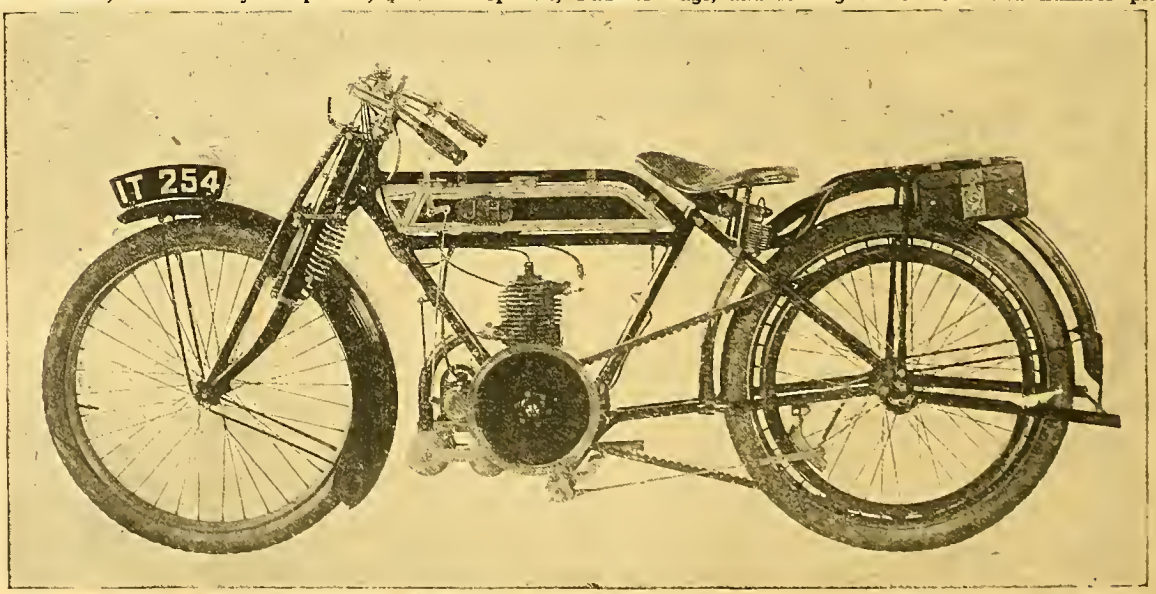
Dear Sirs,

Enclosed please find postal order in payment of Tubes. The ones I have now have been in since June, 1913, and seem as good as ever.

This is the J.H. Reliable 2½ h.p. Two-stroke Single Gear.

Supplied also with two-speed gear, chain-cum-belt drive, or three-speed Sturmey-Archer hub gear.

Villiers engine, 70 × 70 mm., 269 c.c. Druid forks, Bowden brakes, Palmer or Dunlop studded tyres 26in. × 2in., Lycett's saddle, Best & Lloyd drip feed, ⅜in. Dunlop belt, Pannier bags, and folding kit of tools and number plates.



THE IDEAL MOTOR FOR THE YOUNG OR OLD. Immediate Delivery.

SPECIAL ATTENTION GIVEN TO THE REQUIREMENTS FOR COLONIAL TRADE.

J.H. MOTOR ENGINEERING WORKS, Castle Mill Street, MUMPS, OLDHAM. JAMES HOWARTH, Proprietor. Write for Catalogue at once.

New Models.—

of machine fitted with a spring frame. This will be equipped with the Splitdorf magneto generator, which is a combined magneto and dynamo, while an electric horn and rear-driven Corbin-Brown speedometer also form part of the equipment. It will be noticed that in the illustration the kick starter is shown as being on the near side of the machine, but in the final model it will be on the off side, as before.

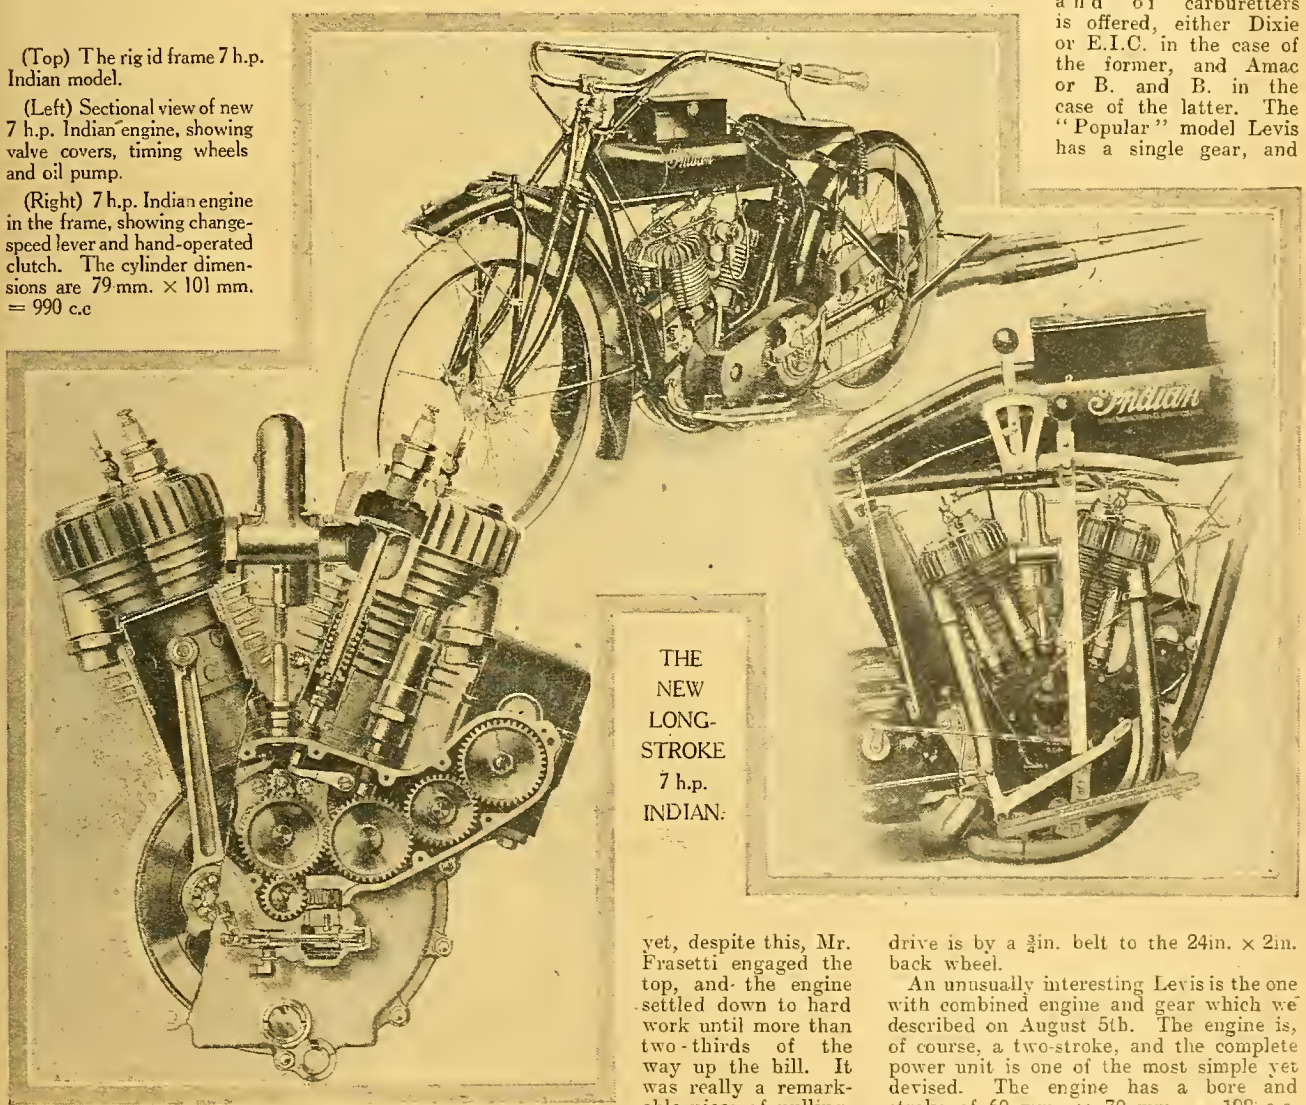
The model G, of which a threequarter view is shown, is exactly the same as the model F, except that it has a rigid frame, and is consequently what may be termed a T.T. type. The illustration shows a Schebler carburetter, but this machine will be fitted with the Indian automatic, which has been so satisfactory in the past. The kick starter will also be on the other side of the machine.

The popular model B, the 5 h.p. twin, 70 mm. × 89 mm. (684 c.c.), is practically unaltered for 1916. It, and the other models described, have 28in. wheels, while the 7 h.p.'s have 3in. tyres, and the smaller twin is fitted with 2½in. tyres.

A Run on the New 7 h.p. Model.

The only new Indian actually in London is one of the early type model F's, which does not represent the final type to be placed upon the English market, as many portions of it are hand made. It is, however, an interesting prototype of the new machines, and we were especially gratified when Mr. Wells was kind enough to send us out on a trial run in one of the luxuriously appointed Indian sidecars. Dexterously handled by Mr. Ernest Frasetti, we were soon skilfully threading our way through the traffic in Euston Road, and revelling in the silent running of the engine and the comfort of the sidecar. The traffic in Euston Road was fairly heavy, and we were much impressed by the excellent acceleration of the engine, its quiet running, and the power of the brakes.

Wending our way northwards we eventually came to Highgate Hill, the bottom of which was, of course, obstructed by a tramcar. Second speed was silently engaged, and the machine darted forward like a thing of life. We were now well on the gradient, and yet, despite this, Mr. Frasetti engaged the top, and the engine settled down to hard work until more than two-thirds of the way up the hill. It was really a remarkable piece of pulling, and by no means kind to the engine, as in the effort of demonstrating the pulling powers on top speed, which was really rather high for sidecar use, the second was not engaged until late. It was perfectly obvious that, with a reasonable gear, the engine would have surmounted the hill on top. Although we had eventually to come down to first, we were able to finish the climb on top gear. It was certainly a most interesting demonstration, and we returned to Euston Road full of enthusiasm for the new long stroke engine.



(Top) The rig id frame 7 h.p. Indian model.

(Left) Sectional view of new 7 h.p. Indian engine, showing valve covers, timing wheels and oil pump.

(Right) 7 h.p. Indian engine in the frame, showing change-speed lever and hand-operated clutch. The cylinder dimensions are 79 mm. × 101 mm. = 990 c.c

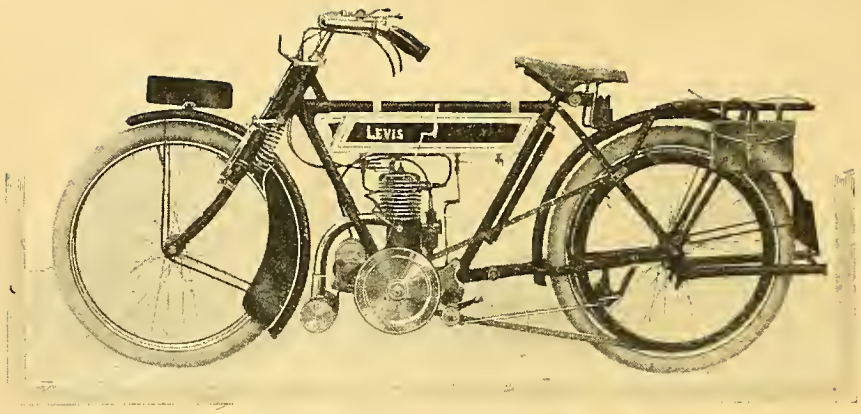
THE NEW LONG-STROKE 7 h.p. INDIAN.

THE LEVIS.

One Model decided upon, others still under test.

THE principal Levis model for 1916 will be the single-cylinder 2¼ h.p. machine, which is one of the most popular two-stroke lightweights on the market judging by the number seen on the road. The engine is of Messrs. Butterfield's own manufacture, and has a bore and stroke of 62 mm. × 70 mm. = 211 c.c. A choice of magnetos and of carburetters is offered, either Dixie or E.I.C. in the case of the former, and Amac or B. and B. in the case of the latter. The "Popular" model Levis has a single gear, and drive is by a ⅜in. belt to the 24in. × 2in. back wheel.

An unusually interesting Levis is the one with combined engine and gear which we described on August 5th. The engine is, of course, a two-stroke, and the complete power unit is one of the most simple yet devised. The engine has a bore and stroke of 60 mm. × 70 mm. = 198 c.c,



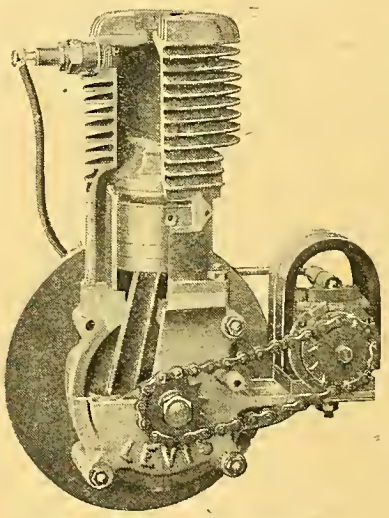
1916 edition of the 2¾ h.p. Levis Popular model.

and is rated as 2-3 h.p. The two-speed gear and clutch incorporated is the Enfield twin clutch and chain type, and is carried in a casing cast in one with the crank case. Another feature is the magneto drive. The magneto is mounted on a small platform at the side of the engine, and driven by means of a small dog lever connected to the crank pin inside the crank case.

Another Levis experimental model that may be marketed at a later date is an extremely interesting 5-6 h.p. two-stroke twin-cylinder machine, the engine of which we described in our issue of July 29th. It will be recalled that the cylinders are horizontally opposed and water-cooled, and in its air-cooled form made a very successful *début* at the Style Cop hill-climb.

An Interesting Frame Design.

A straight tube frame, too, which is somewhat of a departure, is also under test. It consists of a number of small tubes clipped in malleable iron brackets. The frame has been used before and, therefore, tested thoroughly; but the latest idea of Mr. Butterfield's is to clip the tubes in their sockets and not braze them. Although this idea is not new it has not been applied to a standard motor cycle frame before, and if the experiments are successful it will be used for the 1916 frames.



Sectional view of the Levis single-cylinder two-stroke engine, showing shape of piston head.

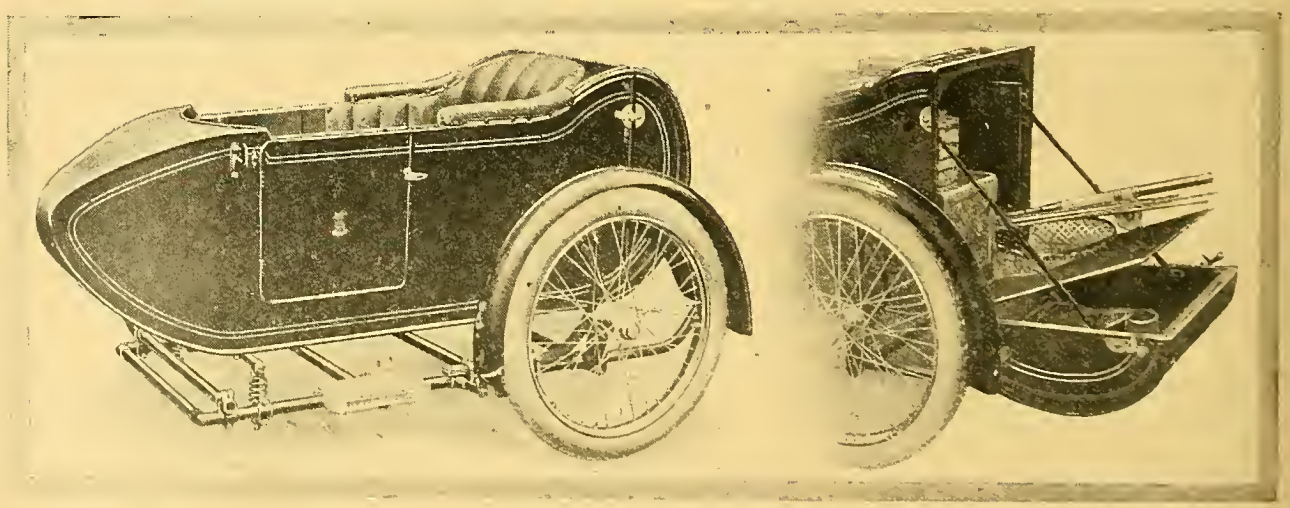
If success be achieved it will mean very much to the repair shop, as, by scrapping certain clipping bolts, the damaged tubes may be removed at once for others to be substituted. Brazing, always uncertain in unknown hands, is eliminated, costs of production reduced, and the steel tube crystals unaltered by intense local heating during brazing. Obviously, the securing bolts when home must be beyond suspicion of moving; but this is a problem not really difficult to solve, and there remains only the enthusiast who may bring disaster on himself by interfering with the bolts.

NORTON SIDECARS.

To be Supplied Apart from the Norton Bicycles.

THE makers of the Norton motor cycles have been supplying their own sidecars with their passenger outfits for some time past. They have now gone a step further, and will supply two of their sidecar models by themselves and ready to fit any make of motor cycle. This step has been taken as a result of the demand for the Norton *de luxe* and sporting type sidecars. Both models are illustrated herewith, and it will be gathered from the pictures and the following particulars that each is a fine specimen of its type.

The *de luxe* model is both attractive and serviceable. Interest centres in the bulbous rear of the body, which swings down at will so forming a table which may be used for *al fresco* meals. Under the table and in the bulbous part of the back is a compartment capacious enough to carry personal luggage for driver and passenger. The compartment immediately behind the seat can be used for spare petrol, oil, and tools, while fishing rods or a gun may be passed below the seat from this compartment and carried unobtrusively and without inconvenience. The upholstery and finish is all that one would expect in a high-class sidecar, and triple leaf C springs are a guarantee of comfortable riding over rough roads.



The Norton de luxe sidecar The capacious back compartment is worthy of note, and the neat manner in which it folds up. This sidecar attachment can be supplied apart from the firm's motor cycles.

Bates-built at the "Front."

MORE SPEED,
MORE SAFETY,
MOST MILEAGE.

W. & A. BATES, Ltd.,
Leicester. 21st June, 1915.

Gentlemen,

I feel that I must write to you and express my appreciation of your Motor Cycle Tyres as being second to none. Owing to the fact that I experienced no trouble from a Bates Tyre in civil life I fitted one to a Douglas before coming to the Front. Roughly, the tyre ran for about a month in England and six months with the B.E.F., on roads more fitted for a steam roller than a motor cycle, without a puncture or without once being deflated, and surprising as it may seem, the tyre was as good as new when evacuated with the machine. I don't know whether this constitutes a record or not, but I think it really marvellous.

Yours faithfully,
(Signed) G. S. GARRARD, L.-Cpl.,
Despatch Rider,
Leicester Yeomanry.
B.E.F.

P.S.—The Tyre I bought first from you is now at my home in England fitted to a Triumph M.C., and was, when I left, as good as new, although it had been run considerably.

W. & A. BATES, LTD.,
St. Mary's Mills, Leicester.

Depots—LONDON, GLASGOW. and NEWCASTLE.

New Models.—

In the sporting model a successful attempt has been made to meet the demands of those riders who, whilst desirous of a light sidecar useful for occasional speed work, wish to possess a vehicle capable of serious touring. The extended rear forms a useful locker for petrol, spares, and small amount of luggage, and the body is roomy and comfortable. As its name implies, it is designed on low, fast lines, and altogether it is a body good to look at.

THE NEW "ALL BLACK" B.S.A.'s.

Powerful Single-cylinder Machines for Solo or Sidecar Work.

THE B.S.A. motor cycles, both solo and sidecar machines, have proved so successful in the past that no radical changes have been found necessary for 1916, but the machines have been improved in many minor details. Models H and K are both equipped with 4¼ h.p. engines, 85×98 mm. bore and stroke (556 c.c.). The former is chain-driven throughout, the chains being enclosed in cases, and a shock absorber is attached to the engine-shaft; the latter is fitted with chain-cum-belt transmission. Both models have a three-speed gear on the countershaft giving ratios of approximately 5, 8, and 12¾ to 1. The whole range of these gears can be raised or lowered by fitting sprockets of different sizes. A kick-starter is mounted on the gear box. The T.T. model has, of course, an engine under 500 c.c., the size being the popular 85×88 mm. This model is belt-driven and fitted with a variable pulley giving gears of 4¼ to 5¾ to 1.

A Semi-automatic Carburetter.

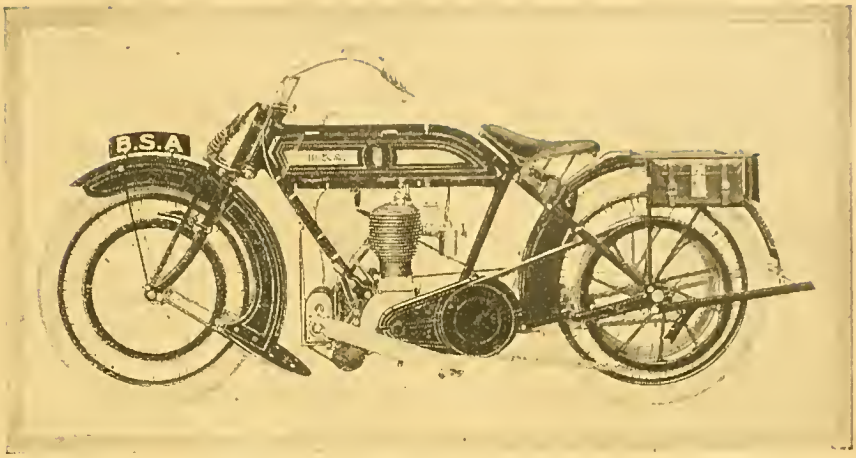
The B.S.A. carburetter with adjustable jet is fitted to all machines; this is fitted with an improved top feed, which is said to prevent flooding, and renders the machine very flexible. The number of nickel plated parts has been much reduced with the object of making the machines more weatherproof, and Pellolit enamel—a British invention—is used instead on the whole frame. This, as our readers know, has special virtues in appearance, durability, and power to prevent rust. No less than four coats are given. The frames are strengthened where necessary with steel liners, and the top tubes are butted at the head.

The B.S.A. front and rear brakes both operate on the inside of the V of special belt rims, the former being applied by the right hand and the latter by the left foot, and both wheels can be taken out without disturbing the brakes or connections—a very real advantage.

The tank holds 1¾ gallons of petrol and 2½ pints of oil, lubrication being by semi-automatic sight-feed drip.

B.S.A. Sidecars.

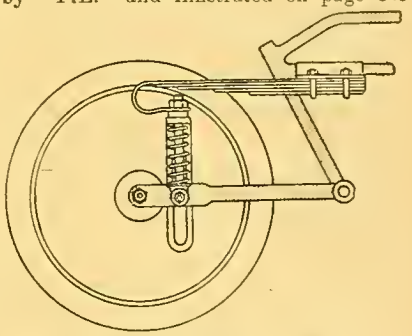
The B.S.A. machines, being strong and powerful, are largely used for passenger purposes, and two sidecars are constructed by the B.S.A. Co. Both are coachbuilt, and No. 2 is provided with special springing at the rear in the shape of helical springs enclosed in cylinders, the front being supported on leaf springs. The wheels of machines and sidecars are shod with Dunlop or Palmer cord 26×2½in. tyres, with the exception of the T.T. model, which has 2½in. tyres. Brooks or Xl'All saddles are fitted at the purchaser's option.



The 4¼ h.p. B.S.A. may also be obtained with chain-cum-belt transmission. B.S.A.'s are to have weatherproof finish in 1916.

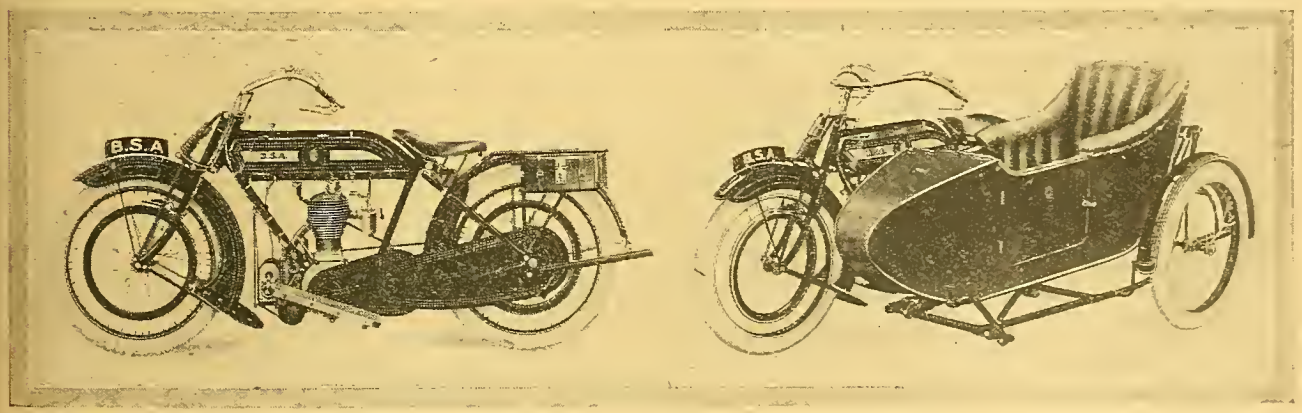
A REAR-SPRINGING DEVELOPMENT.

WE have received from a reader—"E.R.," of Liverpool—a suggestion for the further development of the rear springing device developed by "F.L." and illustrated on page 345



System of rear suspension suggested by E. R., of Liverpool,

of the issue of October 7th. The accompanying sketch shows "E.R.'s" scheme. In addition to the spiral spring employed by "F.L.," and which it is intended to enclose, there is a leaf spring attached to a plate secured to the bottom rail.



The 1916 model 4¼ h.p. B.S.A. with and without sidecar. This machine has a three-speed countershaft gear and all-chain drive. The single-cylinder engine is 85 mm. × 98 mm. bore and stroke.

TIMES TO LIGHT LAMPS

Oct.	21st	5.56 p.m.
,,	23rd	5.51 ,,
,,	25th	5.46 ,,
,,	27th	5.43 ,,

In London half an hour earlier.

Main Roads in Kent.

A Folkestone correspondent has kindly supplemented the information given under the above heading in *The Motor Cycle* of a fortnight ago. He reports that the entire main road to Dover *via* Maidstone, Ashford, and Folkestone is now in good condition, with the exception of a short stretch near Harrietsham at present undergoing repair.

Trade with China.

British motor cycle manufacturers wishing to enquire into the possibilities of cultivating business in China will be interested in the Board of Trade announcement that one of their commissioners, Mr. T. M. Ainscough, has just returned after studying the conditions and prospects of British trade in China. Mr. Ainscough is prepared to see by appointment representatives of British firms at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

James Machine Stolen.

A twin-cylinder James, No. 65,302-5,390, registration No. LD 2,952, has been stolen from outside a restaurant in Oxford Street. The rightful owner, Mr. P. O. S. Nichols, 10, Stone Building, Lincoln's Inn, W.C., would be glad of any information leading to its recovery.

Duty Payable on Imports.

An arrangement in connection with the collection of duties on foreign imports of motor vehicles, which is likely to prove very awkward to importers, is the decision of the Excise and Customs authorities to collect the duty at the current rate of exchange from day to day. It would appear from this decision that importers will never know what their goods are costing, and therefore will be unable to make any fixed prices to their customers without risk. A certain large importer has called our attention to the matter, and stigmatises the rule as being most unbusinesslike and uncalled for. The writer points out that the Government would certainly not be the losers if it made a fixed rate of exchange to be in force for a period of six months or more. Importers would then know exactly what their goods were costing them for a reasonable length of time, and would fix their prices to customers and agents with a certainty of a profit.

A Standard of Lighting.

We should not be at all surprised if the authorities do not shortly come to some definite decision concerning a universal standard of lighting for all motor vehicles.

Motorised Perambulators.

As showing the influence of motoring, the latest in baby perambulators have disc wheels. Everything must be speedy nowadays! It has been suggested that Auto-wheels might be attached to perambulators, and, with suitable controls for the occupants, nurses could be dispensed with!

Beating the Mail Train in South Africa.

A 7 h.p. Indian and Gloria sidecar has recently been driven from Johannesburg to Durban, a distance of 420 miles, in 18h. 29m. P. E. Hunt, of Johannesburg, and R. H. Jordan, of Durban, rode the machine, and Messrs. Williams, Hunt and Co., of Johannesburg, who are the Indian agents for all South Africa except the Cape province, inform us that the time is record, and beat the mail train by no less than five hours and nine minutes. The average speed of 22.7 m.p.h. at first thought may not seem high, but to keep to this continually for eighteen and a half hours over South African roads (and all types are encountered between Johannesburg and Durban) is no mean achievement. We are told that not a single mechanical adjustment was necessary.

A Chaplain's Motor Cycle

A member of the M.M.G.S. in Flanders relates how he had an A.J.S. to tune up for the chaplain. A small nut fell into the crank case. Smearing some grease on the flywheel he slowly rotated the pulley, and the nut was picked up on the first revolution. The machine was soon in use again.

Lieut. C. E. Holaway, R.F.C., who is at present in France with the B.E.F. Mr. Holaway is the designer of the Edmund spring frame motor cycle, reference to which has on more than one occasion been made in *The Motor Cycle*

Motor Cyclists in the A.S.C.

We extract the following promotions of motor cyclist officers in the A.S.C. from the *London Gazette:*

To be temporary Captains—Guy Lee Evans, J. Gibson.

To be temporary Lieutenants—B. C. Barton, J. C. Chater-Lea, E. A. Colliver, S. A. Rowlandson, C. L. Scott.

Proposed Services Hill-climb in Scotland.

The suggestion to hold a competition in Scotland for motor cyclists attached to the Services is still being discussed in Scottish motor cycling circles. At the moment the trouble is to find a hill convenient for Glasgow, Stirling, and Edinburgh.

Average Prices

We give below the average prices of second-hand machines offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model, the average for the past week is quoted. Otherwise, the last average within the past month is given.

When we tell you that our B 150 is very much more comfortable than any other lightweight motor cycle saddle on the market, we state what we know to be a fact.

We designed B 150 with the firm intention of producing the best saddle we could possibly make, bearing in mind the special requirements of the lightweight rider, and we say quite definitely that we have done so.

Scientifically modelled and padded, and beautifully sprung on BROOKS patent compound springs, B 150 guarantees your perfect comfort.

A Sad Accident.

We regret to see that a lady motor cyclist was the victim of a fatal accident which occurred in North London on October 9th. The lady in question, Mrs. May Boulter, was travelling to Essex for the week-end with her husband, and both were mounted on motor cycles. Mrs. Boulter collided with a motor ambulance outside the Southgate Council Offices with the fatal result mentioned.

A Useful Book.

The third edition of "Tracing Troubles" is now to hand, and on sale everywhere, price 1s. It is a handy volume which deals with all the faults to which motor cycles are liable, showing how they can easily be discovered, and the best method of rectifying the trouble. To use the author's own words, "Its purpose is to educate the novice out of his normal 'Hit and Miss' method of tracing troubles, and afford to all a systematic means of diagnosing troublesome symptoms and of curing the faults they indicate." This new edition has been thoroughly revised and a considerable amount of new material added, especially in the section which deals with the two-stroke type of motor cycles, in view of the vastly increased number of two-stroke engines now in use.

New Models and "The Motor Cycle."

During the past few weeks quite a number of 1916 models have been described in *The Motor Cycle*, many of them exclusively, and for reference purposes these are outlined as follow :

A.B.C. 250 c.c. engine, September 30th.
Bramble sidecar, August 19th.
Brough 3½ h.p. twin, September 9th.
Calthorpe two-stroke and 4 h.p. twin, October 7th.
Connaught two-stroke, October 14th.
Douglas 4 h.p. twin, October 7th.
Dunkley two-stroke sidecar, October 14th.
Edmund-Jap 2½ h.p., with spring frame, October 14th.
Indian two-stroke lightweight, October 14th.
Ivy two and four-stroke, October 14th.
Low generator, July 8th.
New Imperial, October 14th.
O.K., October 14th.
Scarlet two-stroke, August 19th.
Service lightweight sidecar, September 2nd.
Ward two-stroke, September 30th.
Wulfruna, October 14th.
Yale 7 h.p., October 7th.

The current issue contains many more 1916 machines, thus showing that in spite of Government work some firms find time for improving existing models, if not turning out entirely new designs. The following machines are described :

B.S.A.
Indian 7 h.p.
J.E.S. lightweight.
Levis.
New Ryder two and four-stroke models.
Norton sidecars.
Revere.
Zenith.

No Import Duty on Sidecarriers.

As will be seen from one of the leading articles in this issue motor cycle sidecarriers are to be included in the commercial vehicle exemption from the 33⅓% import duty now in force on pleasure cars, motor cycles, and parts. We pointed out to Mr. McKenna the desirability of exempting these popular and useful business three-wheelers, and the following letter received in reply shows such will be the case :

Treasury Chambers, Whitehall, S.W.
October 14th, 1915.

Dear Sir,—In reply to your letter of the 4th inst., I am desired by the Chancellor of the Exchequer to inform you that motor cycle sidecarriers will be exempt from duty if the importer proves to the satisfaction of the Commissioners of Customs and Excise that they are constructed for use solely in the conveyance of goods in the course of trade, and are intended to be so used, and also undertakes to comply with any regulations as to marking which the Commissioners of Customs and Excise may make.

Yours faithfully,
ALAN PARSONS.

A Coast-to-coast Despatch Ride.

A VERY interesting experiment has been carried out by the motor cycle section of the Sheffield Volunteer Defence Corps in the form of a coast to coast and home despatch ride.

Three riders left Sheffield on Saturday last for Grimsby (seventy-eight miles) to be in readiness for an early start on Sunday morning.

These three riders (Sergeants Rathmell and Fletcher and Private Dover) duly presented themselves to the officer in charge at Grimsby Central Police Station armed with letters of authority from the Chief Constable of Sheffield (Major J. Hall Dalwood), who is Regimental Commandant of the Corps, to claim the despatches there awaiting them to be conveyed to the Officer Commanding Old Swan Police Station, Liverpool, a distance of 155 miles. The three riders then had to return to Sheffield, making a total distance of 312 miles.

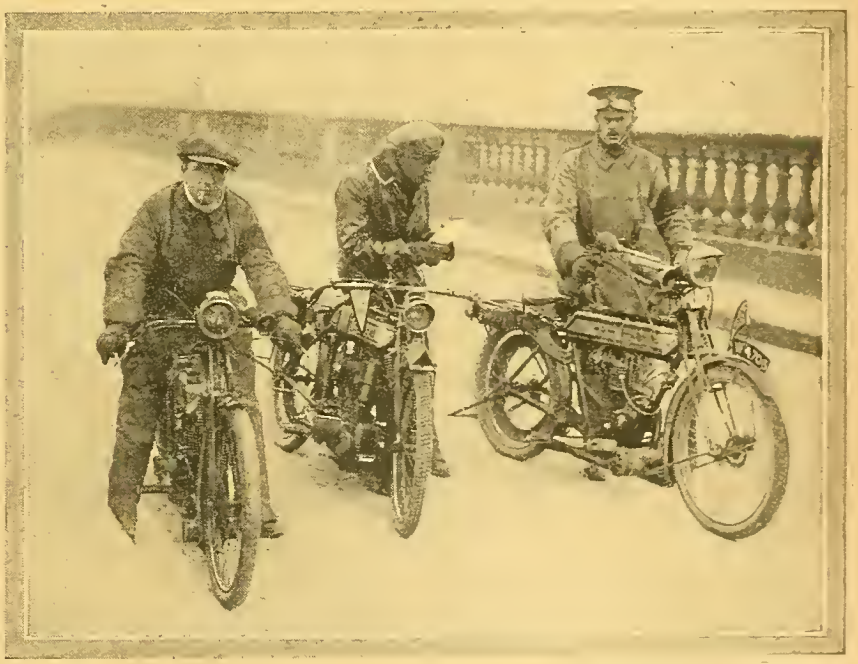
All were away at 7.5 a.m., and went well together for some distance. At Market Rasen Sergeant Rathmell was unfortunate in having the valve of the oil pump on his Rudge-Multi blocked, which caused trouble, but he made for Gainsborough, where Privates Haslam and Blake were to meet the riders. Here he handed over the despatch to Haslam and Blake for conveyance forward to Liverpool.

Sergeant Fletcher by this had taken the lead on his 6 h.p. A.J.S. and sidecar. At Sheffield he had twenty minutes' lead on Private Haslam, who had now made up time and got into second place. This was by no means an easy ride, the riders having to enter Sheffield between certain points and avoid being captured by a force of scouts, who were patrolling the high roads and byways in the hope of capturing the despatch riders.

So far as we are aware, no captures were made, all the riders succeeding in getting through.

The first men to arrive at Old Swan, Liverpool, were Sergeant Fletcher and Private Haslam, who tied and share the honours. On handing in the despatch at Liverpool, they received a reply to be conveyed to the Chief Constable at Sheffield.

The following distances were covered by the respective competitors during the week-end : Sergt. Fletcher (6 h.p. A.J.S. and sidecar), 312 miles (the only man to complete the whole journey); Pte. Dover (7 h.p. Indian and sidecar), 300 miles; Sergt. Rathmell (3½ h.p. Rudge-Multi), 262 miles; Pte. Haslam (3½ h.p. Ariel), 220 miles; Pte. Blake (2½ h.p. Levis), 210 miles.



Members of the Sheffield Volunteers (Motor Cycle Section) in the coast-to-coast despatch ride. Pte. Haslam taking over despatch from Sergt. Rathmell at Gainsborough bridge

POPE

THE SPRING FR

A Selection of Char

OUR readers need no reminder of our firm belief that the motor cycle of the future will have a spring frame; for years past we have encouraged this by every possible means. More than usual attention has been focussed on the problem this year, and this may be put down to several causes, among them being the ever increasing demand for spring framed machines from Overseas and the deterioration of roads throughout Great Britain due to the excessive military transport occasioned by the war. A casual glance through issues of *The Motor Cycle* during the

FRAME PROBLEM.

Characteristic Designs.

The past few months will show the activity being displayed in this direction by designers and makers, and it has been considered an opportune moment to place before our readers a collection of drawings showing some well known rear springing systems and other designs which have followed our campaign in favour of rear sprung motor cycles. The sketches are practically self-explanatory, but it should be added that the problem of satisfactorily springing the rear portion of a motor cycle is by no means an easy one; the difficulties to be overcome are more numerous than would appear at first sight.

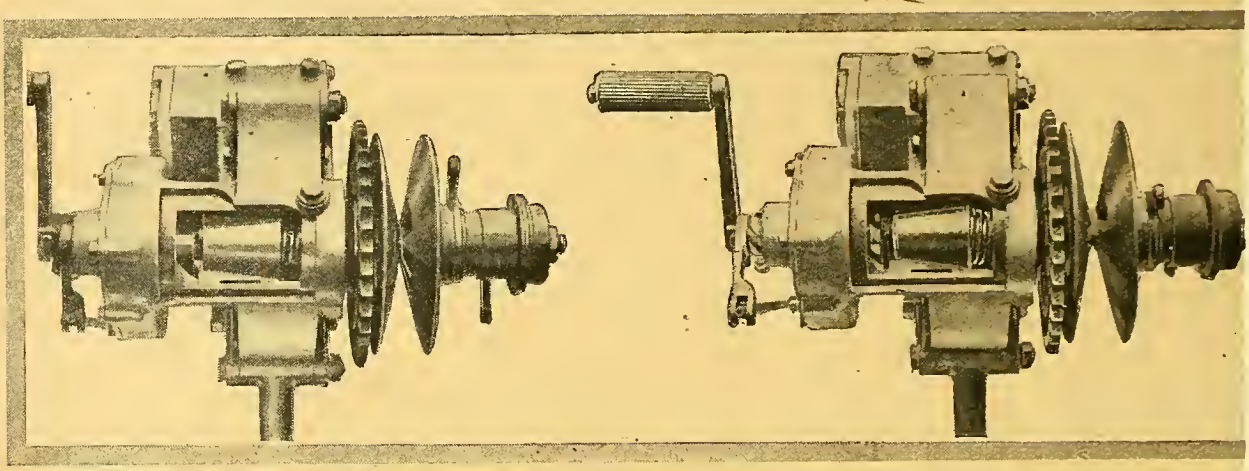
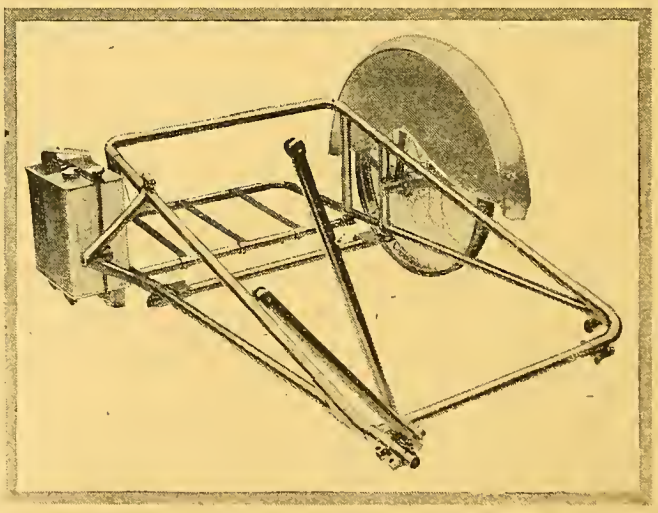
ZENITH 1916 IMPROVEMENTS.

Detail Modifications tending to Increased Simplicity—Good Sidecar Design.



Zenith clutch and kick starter. (Left) Clutch in engagement. (Right) Clutch out.

THERE are to be no drastic alterations in the 1916 Zenith models, but such alterations as there are show ingenuity and reflect great credit on the company's gifted engineer. In the accompanying illustrations we show some hitherto unpublished details in the countershaft clutch and gear. Of these one illustrates the clutch out of engagement. It will be noticed that it is of the cone pattern, the male portion being steel and the female portion phosphor - bronze. When the cone clutch is in, the engine will drive the machine, but on the slightest sign of slip the dog clutches (shown on the extreme left of the illustration) engage, and this operation is effected by means of a light spring. It will be seen, therefore, that all the smoothness of the usual cone clutch is preserved, but, notwithstanding, there can be no clutch slip, as the drive becomes entirely positive. The belt prevents the transmission from being in any way harsh. A groove in the male portion of the clutch collects any surplus of oil, which when the machine is running is thrown by centrifugal force through holes on to the female portion.



New Zenith sidecar chassis showing interesting frame design.

Easy Chain Adjustment.

The countershaft gear box, or rather clutch and kick starter casing, is pivoted at its base, and to adjust the chain it is only necessary to undo a nut and make use of a chain adjuster accessibly placed above it. A somewhat similar improvement is also carried out in the mounting of the magneto, the bracket of which is pivoted below its centre. A leg from the rearward end of the bracket has a slot in its extremity through which a bolt passing through a lug in the frame engages. If this bolt be unscrewed the bracket may be swung through a distance equal to one chain link. By this means the adjustment of the magneto chain may be effected in the simplest possible manner, and without any possibility of disturbing the alignment.

What is known as the "back section" in the Zenith frame has been considerably improved. It is what in other motor cycles would be called the chain stays, and its improvement consists in the simplification of its m facture. The forward end, instea consisting of five lugs, is now a s malleable steel casting. Yet an small innovation is the provision new clutch pedal giving increased l age, and a slower movement in eng or declutching.

The Zenith Sidecar.

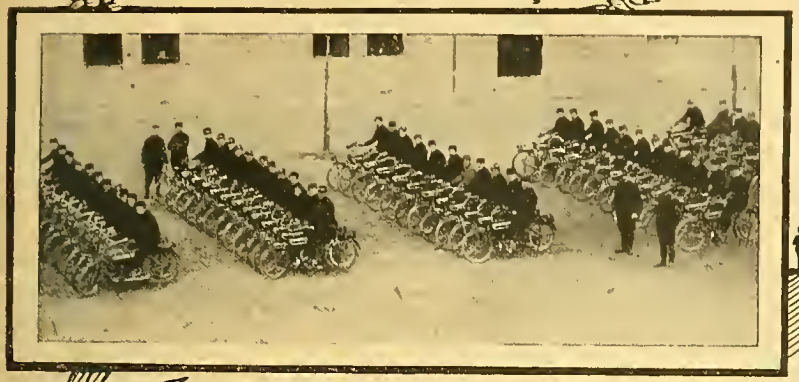
The chief novelty is the new Z sidecar, which is really an exc piece of work. Its chief features its triangular duplex side mem the rear member being also duplex has a spacious carrier at the rear, a simple and ingenious spare petrol carrier. It possesses also triangu stayed brackets to carry the whe one side and the chain stay attach on the other. It is altogether supp at four points, and possesses the fu advantage of being composed e sively of straight tubes.

Returning to the bicycle, we mention the excellent brackets or slightly offset secondary tube of frame. These are cast in one witl lugs, and after rubber buffers have placed on these the tank is screwed place. This is an excellent arr ment, and allows the tank to be f fixed in place.

BRADBURY PROGRAM

NO change is to be effected i specification of Bradbury mac for 1916, though two mode this popular make are to be drawn. The 4 h.p. single two- chain-cum-belt, or all chain to ord not to be supplied during the cc year, and the same applies to the 3½ three-speed horizontally-opposed These reductions are the result o Bradbury works being almost en taken up by the manufacture of a tions, and it is to be feared that d 1916 the Bradbury Co. will remain a the many leading makers whose o of machines will necessarily be limit

With the French Army at Montluçon



With the FRENCH ARMY against the common foe

Thousands of riders of "TRIUMPH" Motor Cycles have found Clinchers the perfect tyres. Triumphs and Clinchers hand in hand have given these motor cyclists nothing but pleasurable riding. Triumphs and Clinchers together have become a watchword of efficiency.

The French Army has added to its fighting force a very large number of Triumphs—a few of which, photographed at Montlucon Barracks, are shown above. That Triumphs and Clinchers will give the same service in the firing line as they have given on peaceful roads is certain. Our Gallant Allies will find Clinchers are ready for any demands upon their efficiency. Over the worst roads, under real war conditions, the lives of the men who ride them will be at the mercy of their tyres, and Clinchers will not fail them.

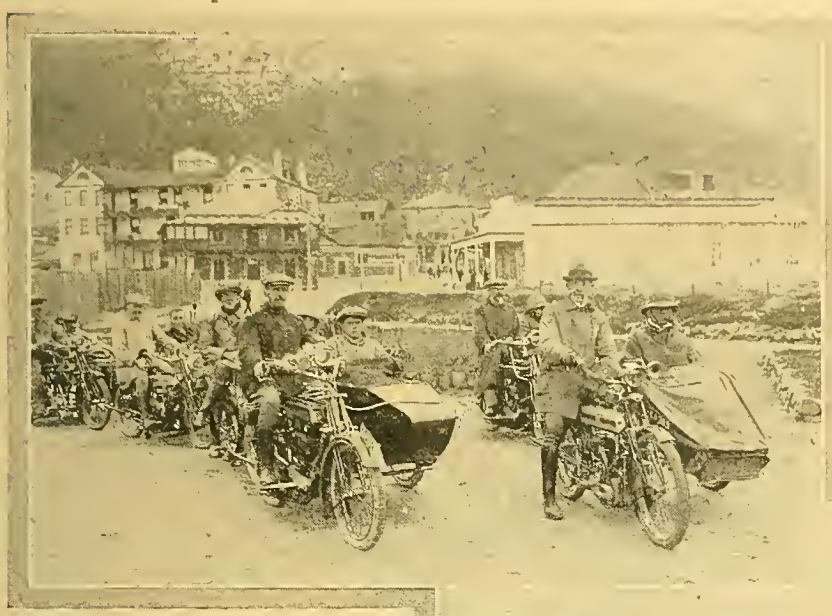
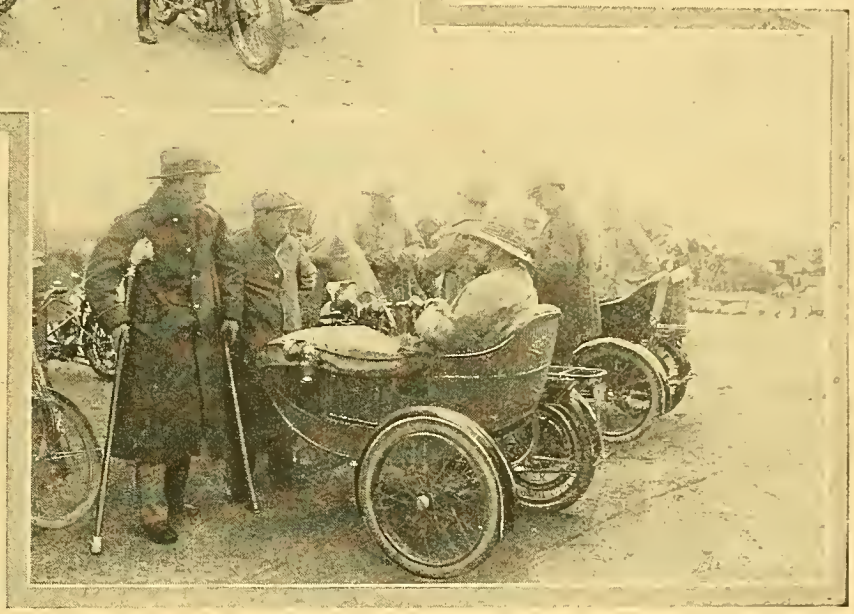
Sidecar Run for Wounded Soldiers at Cape Town.



A run organised by Cape Town motor cyclists for the benefit of wounded heroes.

CAPE TOWN motor cyclists, following the example set by English riders, have of late been organising sidecar outings for soldiers wounded in Botha's successful campaign in what was German South-West Africa. Many of the more badly wounded are now well on the way to recovery in the Cape Town hospitals, and the sidecar outings have undoubtedly quickened the convalescence and made the time more pleasant for the gallant men. Although winter in that part of the world, the runs have been very much appreciated by all, and Cape Town motor cyclists take it as an honour to be able to give some pleasure and assist in the complete recovery of their fellow countrymen.

The accompanying photographs were taken when a party was conveyed from the military hospital at Wynberg to the seaside resort of Minzenburg, which our Cape Town correspondent describes as the Brighton of South Africa. But, judging by the photographs of Minzenburg, we can only conclude that our correspondent has never seen Brighton or heard a true account of it.



A Petrol Consumption Test in Scotland.

THE Glasgow Club had a hill-climb on the card for the second Saturday of the month, but, owing to the new petrol duty, the fixture was changed to a petrol consumption test and postponed for a week. It was duly held on Saturday last over a triangular course, starting and finishing at Clarkston, one of the southern suburbs of Glasgow. The conditions of the contest were of the simplest nature. Competitors were required to furnish on their entry forms particulars of the weight of their machines and their cylinder capacity, and on arrival at the starting point were required to empty their tanks. Each man was then supplied with a measured quantity of fuel, and the rider who covered the greatest distance on his allowance was declared the winner. The competition was regarded purely as a sporting event, few, if any, of the entrants taking the trouble to tune their machines. There were nine starters, and the result was as follows:

	Rider and machine.	c.c.	Miles ridden.	m.p.g.
1.	D. Quinton Bell (6 A.J.S. sc.) ...	750	39	79½
2.	G. H. Cutbush (5-6 Ariel sc.) ...	700	26	63
3.	A. J. C. Lindsay (3½ Rover) ...	500	24	131

The winner used a Binks carburetter.

A Suggested Hill-climb.

It appears to be somewhat doubtful if the suggested service competition in Scotland will now take place. Owing to various circumstances the only possible form that the meeting could take would be a hill-climb, and it is difficult to find a suitable hill accessible to riders from both Edinburgh and Glasgow. It has been proposed to hold a separate competition in each district, and if anything at all is done it will probably be in this way. Mr. J. T. Fulton, the secretary of the Scottish A.C.U., states his willingness to bring the matter before the Competitions Committee of that body if any general desire for a contest is shown.

MILITARY NOTES.

MOTOR CYCLISTS IN THE RED CROSS.

MECHANIC FRANK BROWN, of the British Red Cross, in sending us the photograph reproduced on this page, says that they have a few motor cycles used for despatch carrying. These are mainly Douglas, Rudge, B.S.A., and Bradbury, and they are standing up remarkably well to the hard work. When the photograph was taken the men had just finished cricket practice, the wickets used being pieces of a mined boat washed ashore a few days previously. Brown says that a football would be welcomed if any reader would kindly send one.

A FORMER T.T. RIDER IN GALLIPOLI.

NOEL E. DRURY, the well-known Irish motor cyclist, who regularly figured in the early Tourist Trophy races, has written to the *Irish Cyclist* from Gallipoli. It is one of the most interesting letters from men on service we have read, the description of life on the Peninsula being vivid in the extreme. It is good to know that motor cycles are still being used out there, as Drury refers to a couple of Douglas-mounted despatch riders. "I nearly shouted for joy the other day. I heard what I thought was a tremendously fast machine gun, which I thought at first was moving. Imagine my surprise to find a despatch rider forging his way along on a Douglas! What a grand sound he made, and how it reminded me of less bloody battles fought in the Isle of Man."

Drury has a commission in the 6th Batt. Royal Dublin Fusiliers.

A few British Red Cross mechanics, all keen readers of *The Motor Cycle*, enjoy a game of cricket on the sands in Northern France. The little girl building sand castles, and the French officer sleeping in the deck chair in the background, make it difficult to realise that the photograph was taken within the war zone.

"THE MOTOR CYCLE" RECRUITING SECTION.

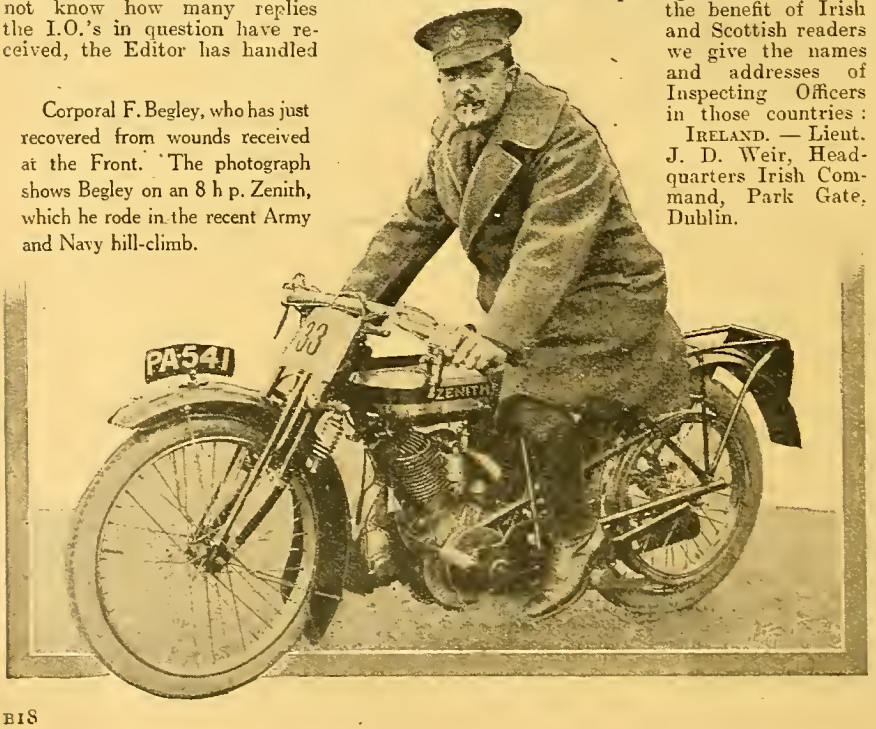
SPLENDID RESPONSE TO APPEAL FOR DESPATCH RIDERS.

THERE has been an excellent response to the appeal for despatch riders published in our last issue. It may be recalled that we gave the names and addresses of nine inspecting officers for different districts, and though we do not know how many replies the I.O.'s in question have received, the Editor has handled and dealt with fifty-three applications, many of them from Ireland and a number from Scotland. In each case full particulars of enlistment have been issued, and the applicants referred to the nearest Inspecting Officer, but for the benefit of Irish and Scottish readers we give the names and addresses of Inspecting Officers in those countries:

IRELAND. — Lieut. J. D. Weir, Headquarters Irish Command, Park Gate, Dublin.

SCOTLAND.—Highland Divisional Area: J. H. Thomas, 52, Tay Street, Perth. Lowland Divisional Area: Lieut. J. B. Mayor, 1st Highland Field Coy., Highland Divisional Engineers, 21, Jardine Street, Glasgow.; Major M'Bean, Officer Commanding, Royal Engineers, 21, Jardine Street, Glasgow.

It is surprising that certain recruiting offices still turn away motor cyclists who make enquiries, with some such remark as "We are not recruiting for despatch riders." Surely, the War Office should issue definite instructions to all R.O.'s on the subject of men for the technical sections of the Army.



Corporal F. Begley, who has just recovered from wounds received at the Front. The photograph shows Begley on an 8 h.p. Zenith, which he rode in the recent Army and Navy hill-climb.

With applications received from prospective recruits for the R.F.C. and car drivers and mechanics for the A.S.C. (M.M.G.S.), the total of applications dealt with by the Editor from motor cyclist recruits now comes to 4,554.

Three recruits last week rode from Dewsbury (Yorks.) to Coventry on a 6 h.p. Enfield sidecar. This is keenness to be admired, but it is always well to make an appointment beforehand.

Gerald Hadfield and William Norman arrived from Johannesburg last week, having paid their own passages home specially to enlist. They are now driving cars with the M.M.G.S.

Experienced car drivers and mechanics with workshop experience are still wanted. Applications should be addressed to Mr. Geoffrey Smith, Editor *The Motor Cycle*, Coventry.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Four-stroking on Two-strokes.

Sir,—As some of your readers have complained that their two-stroke machines four-stroke, it may be of use to mention my own experience. I have a 2½ h.p. Alldays-Matchless (Villiers engine), which insisted on four-stroking with any but the smallest throttle opening. I came to the conclusion that with a wider throttle the mixture must be too strong, so changed my jet (Senspray 32) for a 28. This has completely cured the trouble. I may mention that this little machine is capable of taking me up gradients of 1 in 7, where a sharp corner at the bottom compelled a slow start, and will run miles at 25 to 30 m.p.h. without a trace of overheating. I can get 110 miles out of a gallon. The machine is single geared.

TWO-STROKE.

Boycotting German Motor Cycles and Accessories.

Sir,—Whilst heartily sympathising with the spirit of "Delta's" letter (published in *The Motor Cycle*, September 2nd), may I suggest that one important phase of the question has, to a great extent, been overlooked. I refer to the behaviour of British magneto makers. Perhaps a narration of my own recent experiences will best explain my meaning.

A short time ago the contact breaker screw (a slender pin about 1½in. × $\frac{3}{16}$in.) of my U.H. magneto snapped, leaving the threaded end in the armature spindle, but with a large piece projecting above the thread, yet so far down in the hollow of the tunnel as to require a long fine-nosed tool to grip. With some such tool as a dentist's fine forceps it would have been but the work of a minute to grip and unscrew, whilst I could make the new pin myself in a few minutes. However, I had no suitable gripping tool, so sent off the magneto *(less* magnets) to a firm which advertised it could return repairs in a day. I may say that before the pin snapped the instrument was in first-class order, giving very strong current, contact breaker clean, with points almost as new, and there was absolutely no sign of condenser trouble.

In a week or so I had a *pro forma* invoice from the repairers charging for repairs to "faulty" condenser, new contact breaker screw, remagnetising (the magnets were on my workshop shelf!), overhauling contact breaker, and trimming "points," etc., £1 8s. 6d. (The makers' price for broken screw renewal in 1914 list was 5s.)

Of course, it was self-evident they were "making a job"; but what was I to do, for I wanted the machine at once for business purposes, and to have it I must pay as above. Accordingly, under protest, and hoping to receive the magneto at once, I sent the money, pointing out the difficulty they must have experienced over the remagnetising. In reply, they returned me 3s. 6d., saying the charge for remagnetising was an oversight! but no magneto. Eventually, after three weeks it arrived. I examined it. The contact breaker was very dirty, and had traces of rust, so I decided to inspect the armature. What a mess! The makers' finish had been really fine, but now! Well it suggested to me the "boggling" of an old cobbler.

It is said that British magneto makers hope to obtain and retain home trade. I would put this proposition to them. If they may reasonably so hope they must treat their customers approximately as fairly as the German makers did.

Of course, makers must charge highly in these troublous times. I would not have objected, in the above case, to a charge of 10s., but to charge 25s. for a 2s. 6d. job, and, at the same time, unnecessarily to reduce one's platinum points is, I submit, unreasonable.

Possibly, I was unfortunate in my choice of repairers, yet I think it would be well for makers to remember that the war will come to an end some time, and German competition probably be resumed; and I would suggest to fellow riders who may have experienced extortionate treatment that they keep a mental black list of those who thus treat them.

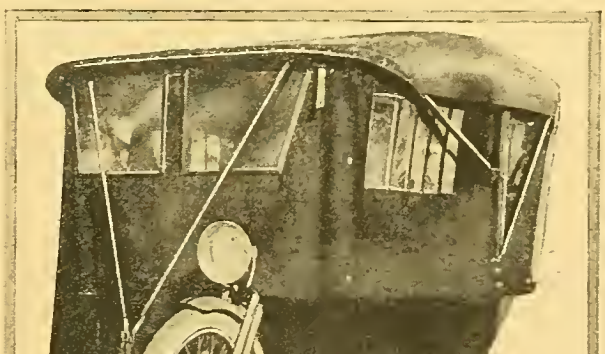
I heartily wish well to British trade, and this is one of my chief reasons why I have written so lengthily, for which, sir, I ask your kind indulgence. It seems to me that a gentle reminder to, and for the good of, the trade is desirable.

SLIDE-REST.

A COPY OF THIS LETTER WAS FORWARDED TO THE FIRM REFERRED TO, AND THEIR REPLY IS APPENDED:

"We are in receipt of your favour to hand, and the writer has looked into the complaint in question. An inspection of our works records would enable you to form your own judgment as to whether care is taken in the carrying out of our repairs. In fact, we shall be very pleased at any time for your representative or even your readers to inspect our works.

"We received 'Slide-rest's' magneto and his definite instructions to carry out any repairs necessary. Had we received any complaint from 'Slide-rest' as to our work, we should have been pleased to make careful enquiries into this. There certainly was a little delay in returning his magneto to him, owing to our annual holidays, to the enormous holiday rush we experienced, and also, the parts his magneto required being unobtainable from the makers, to the fact that we had to make them specially. We might also add that the Government is taking almost our entire output of magnetos and parts, and we are undertaking the magneto repairs for the Mechanical Transport."—For THE RUNBAKEN MAGNETO CO., LTD., J. H. Runbaken, managing director.



A Harley-Davidson sidecar outfit, in which both driver and passenger are completely enclosed. With present-day designs of passenger machines the occupant of the sidecar only is catered for in respect of protection against the elements, and the above way of meeting the case is highly interesting

Leicester Signposts.

Sir,—It may interest you to learn that upon publication of your paragraph in the issue of Sepetmber 16th, page 287, referring to "out-of-date signposting in Leicester," the Automobile Association got into communication with the local authorities on the matter, suggesting the alterations necessary for correct signposting of the road referred to.

We have now heard from the local authorities that our suggestion will be adopted.

STENSON COOKE, Secretary, A.A. and M.U.

A Satisfactory Two-stroke.

Sir,—I read with interest in your issue of October 14th a letter *re* "A Satisfactory Two-stroke," and, like the Editor, should like to know how Mr. A. D. Webb gets his range of speeds from 2 to 45-50 m.p.h.

I should like to give my experiences of a New Hudson two-stroke, which I purchased in May this year; since then I have covered 4,000 miles. I consider my machine the fastest two-stroke here (Beaminster), but I do not think I can exceed 35 m.p.h. It is a 2¼ h.p. two-speed, and I have always got from 120 to 130 m.p.g. until recently, when my consumption dropped to 75 m.p.g., but after a little adjusting I am getting 120 again. I started a 548 mile tour on August 22nd, and my longest runs per day were 170 and 140. On the day I did 170 miles I only dropped down to low gear three times, which I consider exceptionally good. This was from Salisbury to Fenton, Stoke-on-Trent. On the whole distance I averaged 19¾ m.p.h., and during the 548 miles I only used 4½ gallons of petrol (No. 2), so I do not consider Mr. Webb's average m.p.g. exceptional, especially on benzole, as I believe an engine is supposed to go further on a gallon of benzole than on a gallon of petrol.

I may say I have no connection with the New Hudson makers, but am a very satisfied rider. BILL BAILEY.

A Motor-assisted Bicycle.

Sir,—So much has been written in your and other papers of what should become of the motor cycles and motor cyclists after the war that I beg to submit to you an idea for which I have been fighting in the French papers for some years, and which you will perhaps find interesting under the present circumstances.

I am a cripple. Not a war cripple, although I was a soldier some twenty years ago, but after having typhoid fever I lost the use of my left knee, left elbow, and right wrist, and I became very subject to rheumatism, and my joints tire quickly.

Well, I suppose that after the war there will be many a one in similar case. So I am emboldened to go on. Up to the time of my fever (1904) I was an occasional motor cyclist and a very ardent cyclist; in fact, the privation of my cycle was certainly what I felt most. After two years of sticks and crutches I took to cycling again, and, after many experiments, I possess now two multi-geared bicycles on which I can go almost anywhere, but, owing to my weakness, twenty miles per day is my maximum.

So, naturally, I turned my eyes to motors. I had five motor cars, but the joys of motoring in those expensive outfits serve only to make more bitter the remembrance of my journeys on my bicycle. So I bought motor cycling papers, and began to learn what was possible for me in the future.

My past experiences and a few tries soon taught me that the motor cycle was not for me. The speed and consequent draught of air alone would be sufficient to prevent my buying one; but also I knew that the motor cyclist must be physically a fit man, ready in all his limbs for all emergencies, and last, but not least, I did not want speed. I wanted merely some small contrivance to do exactly what I did with my legs—an average of 12 m.p.h. and a return by train if necessary.

I enquired after the auxiliary motors, French and English, and after many references and letters, bought what I thought the best, namely, an Auto-wheel, and as I go every year to Aix-les-Bains for a cure, I took it with me for trying the mountain roads. My experimenting did not go far, for I fell and broke my collarbone.

Nothing like a broken bone for thinking. I reflected then that a cyclist had only a power of ¼ h.p., and that a bicycle was built to that power. That to put upon it a 1 h.p. outfit was at the same time wasting power and trying terribly the frame and wheels, and, lastly, that if a ¼ h.p. man could go anywhere with a suitable gear, there was no reason why a ¼ h.p. motor, aided occasionally with the pedalling ¼ h.p. man, should not also go anywhere with the help of a suitable gear and adequate cooling.

How can such a small motor be made is the secret of the future; but it occurred to me that it could have the following lines: Two-stroke, mechanical lubrication with oil in a sump (like a Velocette), chain drive with a sprocket, the gearing down from the motor being 1 in 10 or in 12.

Such a motor should go anywhere, and the consumption should be very low, perhaps 200 miles to the gallon. Perhaps it could be made for £10; but if any good maker will sell me such a one I am quite ready to pay £20 for it, and take it to the Alps by way of experiment.

What of the cooling? The joint powers of the cyclist and the motor would probably negotiate the stiffest Alpine roads at about 5 m.p.h.,-the stiffest gradients being about 1 in 7. But, owing to their lengths, overheating would perhaps be a trouble, but it would be very simple to fit a fan frictioning on the external flywheel of the motor.

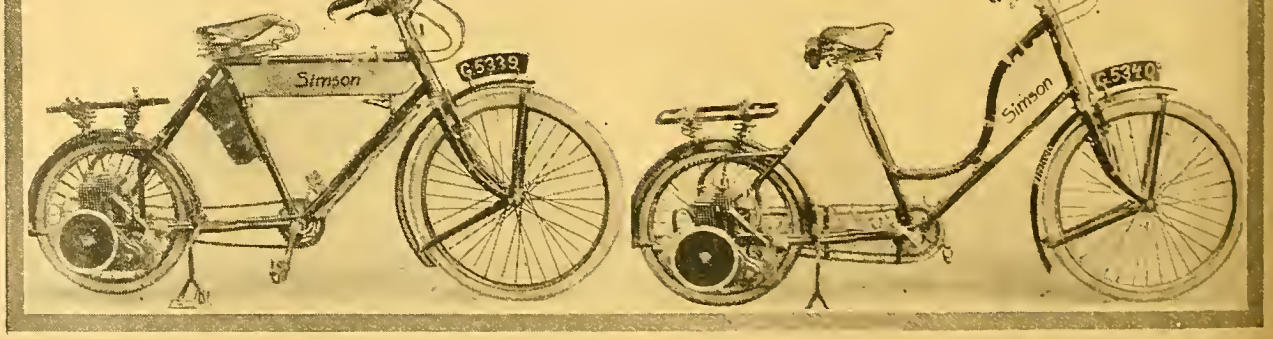
This is a war letter—that is, a letter of a man who, being unable to do his bit, finds the time very long indeed, especially as he passed the three most glorious years of his life learning, and subsequently teaching, the mysteries of the "75." M. QUESNEY.

Rouen.

A Dutch Lightweight.

Sir,—With regard to Mr. E. F. Boyd's appeal, I beg to enclose photographs showing how an Auto-wheel is built into the frame of a bicycle instead of being attached at the side in the usual manner. The price of a new frame is £9.

Amsterdam. SAM VAN DER MARK.



Auto-wheel fitted in place of rear wheel of pedal cycle (See letter on this page.)

Engine Rattle in Two-strokes.

Sir,—It was with very great interest that I read "Oile's" article on two-strokes in your issue of October 7th, for I at one time experienced the selfsame trouble with one of the first 2¾ h.p. two-stroke Dalm engines, made by Messrs. Dalman and Sons.

In my case the rattle occurred when the engine was turning at about 2,300 r.p.m. or 29 m.p.h. road speed. I went to considerable trouble to try and diagnose the cause of the rattle, and experimented with various plugs, as well as trying them in different positions at the top of the cylinder and at the side, but with no beneficial results. After some time I came to the conclusion that it must be due to the expansion of the piston head. I wrote, therefore, to the makers, who informed me that I might cure the trouble by filing a little metal away from the side of the piston above the top ring. This I did, and for some time the rattle ceased. One day, however, it started again, and once more I filed off a little more metal, which cured the noise for about 300 miles, when once more I heard the now familiar rattle. So having had enough of it I wrote to the manufacturers, who requested me to send them the engine in order that they might test it; this they did at their own expense, as well as fitting a new type of piston giving a much greater clearance above the top ring. After this my trouble ceased until I had run about 800 miles, when it recommenced. So I removed the cylinder, and found that a carbon film had become deposited on the side of the piston head, and by the glaze on the carbon I could see that there was no longer any clearance between the head and the cylinder walls. I removed the carbon, and the engine no longer rattled. Since then I have run 3,000 miles, and each time the rattle starts I clean the piston and the trouble stops.

It is very difficult to make any definite suggestion as to why "Oile's" engine suddenly ceased to rattle after running 850 miles from the time of the second overhaul, but in all probability the reason is that the cylinder has become slightly worn, thus allowing more room for the piston to expand; or the carbon film has become detached from the side of the piston head owing to the tapping, and thus left the piston free to expand.

As to the use of Harcourt radiators, they make a wonderful improvement to the running of the engine, especially when a sidecar is fitted, for it is possible to run for miles with the engine "all out" without the slightest signs of overheating, and since fitting them I am no longer troubled with the sparking plugs giving out—my last plug, a single-pointed one, has run over 3,000 miles. C. S. ROSCOE.

Sir,—Like your correspondent in *The Motor Cycle* of October 7th, I have followed the correspondence and articles on "two-strokes" with interest. This excellent article has induced me to send you some notes on my experience with a Popular Levis, which may prove of interest to your readers. I used my Levis daily for business and pleasure from October 6th, 1914, to May 30th, 1915, when I transferred to a 2¾ h.p. twin, four-cycle, but I must admit that I have never had the same fondness for the latter, and I shall eventually go back to the two-stroke.

In a general way my mileage is made up of runs of two and a half to nine miles over very bad surfaced roads, mostly level, but with some short, sharp gradients—one of about 1 in 10. The Levis averaged about 90 m.p.g. In very wet weather I was troubled with belt slip on the stiff gradients, but the feature of the two-stroke which appeals to me is the wonderful torque of the engine at low speeds, for by throttling down until the belt ceased to slip I could invariably mount the hills at slow speed. One engine pulley was worn out at about 1,000 miles, so I had a new one made which increased the gear from 6 to 1 to 5¾ to 1. There was no appreciable difference in hill-climbing, but the general running was improved.

When I sold the machine at about 3,000 miles the original Dunlop belt was still in good condition, and the engine pulley was just visibly wearing.

The original plug—mica, of unknown make—single point, gave no trouble whatever up to about 600 miles, when I began to get trouble in starting. I did not blame the plug at first, because as soon as the engine started firing it would continue quite regularly. There was no spitting or coughing; nothing happened as I sprinted alongside until the engine commenced to fire with perfect regularity. I began to dread starting, although it usually started beautifully after paddling three or four strides. I never knew but what I might be in for an exhausting struggle. I had taken everything to pieces and discovered nothing several times, until one day I only got an occasional spark at the plug when I jerked the magneto around. I bought a multi-point Lodge plug, and my starting trouble was at an end. The same plug was running when I parted with the machine. I tried a new Bosch single point plug on one occasion, but took it out after about a mile of misfiring. This Bosch plug ran perfectly afterwards in a friend's Douglas.

At about 2,000 miles the Levis developed a habit of suddenly rattling and coming to a standstill on stiff gradients. Examination showed that the engine was not unduly hot, the spark was all right, and the carburetter flooded. I would paddle off quite easily, having done nothing. At last, when it rattled and stopped I did not bother to look for the trouble but just waited about half a minute, keeping astride the machine, and then paddled off again without trouble, but it puzzled me. If I started away at the foot of my steepest gradient the machine usually went up without any trouble; if I came over this same hill, having travelled any distance beforehand, it invariably rattled and stopped. It seemed like overheating, but the cylinder was never unduly hot.

About this time I got off my usual beat and rode to Bristol, a distance of 140 miles. The engine rattled and stopped on every stiff hill, and on some of the long pulls it showed the same symptoms, but by immediately throttling down I managed to keep going. On the Calne Downs I decided to try if I could produce the same result on the level, so I opened out and rode hard. About three miles was enough, the rattle began, I kept the throttle open, but came to a standstill. My average speed to Bristol, including all stops, was 20 m.p.h. During the run I tried a new plug, and tried varying the oil drip, but with no effect on the rattle and stop. At Bristol I pulled things to pieces again, taking the carburetter (Amac) and petrol pipes and magneto right off. Everything appeared to be in good order, but in putting back the float I pushed the needle out and with it the small piece of gauze on the intake of the float chamber. This gauze was covered with fine fluff about ½in. thick, which I scraped off. On trying the machine again there was no holding it on hills—no need to humour it—full throttle all the time. I covered the distance from Bristol to Reading (79½ miles) on the return journey in just under three hours, without a sign of rattle, and with no involuntary stops.

From Reading to home (Bexley Heath) I rode easily. By keeping the gauze free from fluff I was never troubled with rattle again. The two-stroke appears to be very sensitive to petrol adjustment, unless it is on the strong side. I experimented with a smaller jet and gradually opened it out with a broach until I was satisfied with the result. On then comparing it with my original jet I found the difference to be almost negligible—something under half a thousandth difference. My experience of two-strokes is confined to the Levis, where I got no rattle so long as I kept the petrol pipes free. May I suggest that on some makes the level in the float chamber is not well enough maintained when the demand is great, such as in hill-climbing or speed work on the level.

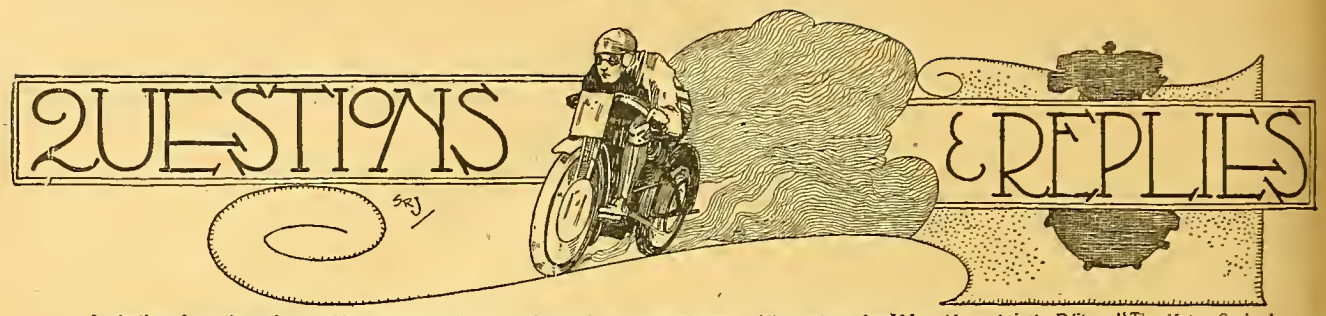
I never had any trouble with four-stroking when starting. May I suggest that this is more likely to occur with the petroil system, where the proportion of oil in the float chamber may be too great after the machine has been standing and the petrol evaporating. The drip feed on the Levis gave no trouble except that it was difficult to estimate the correct position of the adjustment. On the run to Bristol and back the oil consumption was at the rate of 1,020 m.p.g. and petrol 107 m.p.g.

I tried the Levis of a friend who complained of electric shocks from his handle-bars at high speeds. It was like a strong shocking coil. The makers suggested that the belt was bottoming in the engine pulley. A new pulley proved to be an effective cure.

I took my engine to pieces three times for cleaning, and found very little carbon deposit, no tendency for the rings to stick, and the bearings in fine condition

I sold my Levis because I wanted something faster, and as I use my motor cycle every day, in all weathers, the belt slip was a decided nuisance, but the Levis had its points, and I parted with it with a feeling of regret.

SAN KONTWEIT.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Petroil Lubrication for Four-strokes.

I have a 3½ h.p. sidecar combination. Could you inform me if, in your opinion, I should get better results if I mixed lubricating oil with the petrol? —P.H.

The petroil system cannot be used alone for a four-stroke engine, but mixing a little lubricating oil with the petrol is sometimes beneficial in the case of a new engine.

Laying Up a Motor Cycle for the Winter.

Could you tell me what to do with a motor bicycle which is going to be out of use for three months?—R.T.G.

If you wish to lay up the machine, the best plan is to jack both wheels off the ground; that is to say, put the back wheel on the stand, and, if a front stand is not provided, hang the machine from the ceiling with a rope round the handle-bars, so that the front wheel is off the ground. This will save the tyres. Cover all bright parts with vaseline.

Leaky Crank Case.

I have received my engine back from the makers after having a new cylinder, etc., fitted. It is now greatly improved in running, and the only fault I have to complain about is that oil oozes pretty freely from the crank case joints—not the cylinder joints. This is particularly noticeable in the region of the magneto, where oil oozes from beneath, all round, and runs down the crank case. The oil also comes out of the crank case joints beneath the cylinders. In short, the engine gets into a filthy mess after quite a short run, and it is no use trying to keep it clean. What effect will this have ultimately on the running? I have tightened up all nuts without effect, and should like to know if it is possible to cure this without taking the crank case apart, which I have no desire to do, seeing the engine has been so recently overhauled.—J.W.K.

You cannot cure the trouble without taking the engine down. A brown paper washer soaked in boiled linseed oil should be placed between the faces of the crank case; or the faces coated with gold size or fish glue, after having been carefully cleaned. A serious leakage of oil will necessitate a more liberal use of the lubricating pump.

Benzole as a Fuel.

I find, after many experiments, that I get far more power in using pure benzole than is the case with a mixture of benzole and petrol. Unfortunately, in cold weather, benzole alone is apt to freeze. I should be greatly obliged if you would inform me what is the very smallest proportion of petrol mixed with benzole which would check the freezing of the mixture.—T.H.

You may use a mixture of one-third or one-quarter petrol and the rest benzole; this would prevent freezing. We should be interested to know if you are still able to buy benzole, as we have heard that all supplies have stopped. It certainly cannot be purchased in London or the Midlands.

Difficulty in Starting.

I have a 1909 Triumph, which I find very hard to start; one has to get up a good running pace before it gets away. This, of course, is very exhausting, and I often fail to get up enough pace if tired. Several people have given me suggestions. Can you inform me as to whether these are correct? If not, how I can remedy difficult starting. The suggestions are: (1) To rebore the carburetter, which I think is needed; (2) to fit a decompressor.—H.T.

The secret of easy starting is a strong mixture and a small quantity of it. The more frequent causes of bad starting are air leaks at the carburetter and induction pipe unions. As regards your suggestion, we do not know what you mean by reboring the carburetter. Do you mean reboring the cylinder and fitting a new piston? This is often necessary in the case of machines which are five or six years old. The fitting of a decompressor would be of some service to you.

THE MOTOR CYCLE Buyers' Guide

OF 1916 MODELS.

THURSDAY, Nov. 25th, 1915.

Since 1906 the Buyers' Guide has proved a much appreciated feature of this journal. In the absence of a Show, a Buyers' Guide of 1916 models becomes an urgent necessity. Thursday Nov 25th has been selected as the date of this issue.

An Extraordinary Noise.

During a run of ninety miles on my 1911 3½ h.p. an awful rattle started in the engine, and at the same time the engine fired very weakly. This went on for half a mile, when the rattle stopped and the engine fired ordinarily. This happened on and off for the whole journey. Please explain this. I may say the platinum on one of the points is very nearly burnt off. Would this cause the trouble? If so, why?—D.A.S.

We should say that there is something loose in your crank case, a gudgeon pin screw, for instance. We can only advise you to have the engine taken down and carefully examined. The noise could hardly be caused by a burnt-out platinum point, but it is quite likely that this would cause a bad attack of misfiring. The burnt platinum point should, of course, be renewed if it cannot be trued up.

Starting Trouble.

I have a 3½ h.p. single which has lately developed a strange obstinacy in starting from cold, although when warmed up will start quite easily and fire perfectly at either high or low speeds. Even after giving injection by compression tap it will only fire spasmodically and erratically after a good deal of pedalling, and goes on like that, missing and firing alternately for about a minute until warmed up. I have plugged up the holes in the carburetter barrel, but this makes no difference. There is no air leak that I can discover. I have fitted a new high tension cable, and get a spark with plug touching cylinder, though under compression it does not seem to fire. I have cleaned and adjusted points both close and wide without making any difference, also cleaned carbon brush and collector ring.—W.McK.

Your trouble is certainly extraordinary. If an engine is particularly obstinate at starting, there is one remedy which is nearly always certain to help matters, though it is a slightly inconvenient one. This is to detach the sparking plug, hold it upside down, and fill the cap thereof with petrol, then quickly screw it into the engine and push off. We should recommend you to try this, and see if it brings about the desired results. We shall be interested to hear if it does. Also see that your spark gap is not too close; try a gap of about 1 mm. It is possible that the valve is a bad fit in the guide, thus admitting air.

8000 miles without even a single puncture

286, Worsley Road,
Swinton, Manchester.
September 30th, 1915

Messrs. The Kempshall Tyre Co.

Dear Sirs,—For the past 15 months I have ridden a 7.9 h.p. Indian Combination (1914) fitted with your anti-skid tyres; I have travelled over all sorts of roads, the Welsh passes included.

I have ridden 8,000 miles without even a single puncture, and the tyres are still in perfect condition. I cannot speak too highly of the even wear and durability.

I should think that a run of this distance on three wheels without the least tyre trouble, not even a puncture, constitutes a record.

I have just exchanged my machine for a 1915 model.

Yours truly,
(Signed) J. CROSSFIELD.

MUNITION CONTRACTORS, MANUFACTURERS, AND OTHERS

Desiring to Cover in their Open Spaces before the Winter sets in have now the opportunity to secure

PORTABLE WOODEN BUILDINGS

at low prices suitable for Workshops, Stores, Offices, Dining Halls, Workmen's Quarters, Hospitals, Garages, Stables, and numerous other purposes.

SPECIFICATION.—Substantially constructed Sides and Ends in 15ft. and 10ft. Sections respectively, with Window and Ventilation in each Section. Framework of 2in. by 3in. and 2in. by 4in. (according to size) well seasoned Timber covered with stout Tongued and Grooved Matchboards. Roof of strong Principals and Rafters with Tongued and Grooved Boards and good stout Felt covering. No Floor. Complete with Doors, Bolts, and Screws. Any handy men can erect. Carefully put on rail at Works. Any size despatched in three days.

TRACING TROUBLES

(Third Edition)

A new Edition of this handy book for motor cyclists is now ready, thoroughly revised and brought up to date.

Enlarged section dealing with Two-stroke motor cycles.

New section dealing with electric lighting dynamos as applied to motor cycles.

Price **1/-** net. By Post, **1/2**

From Iliffe & Sons Ltd., 20, Tudor Street, London, E.C.

And leading booksellers and bookstalls.

Difficulty in Starting.

(1.) I have a 2¼ h.p. two-speed two-stroke motor cycle which has done just over 200 miles. Lately I have found it hard to start (it has not a free engine) after it has been idle for a day or two. After pushing it a little it partly starts, and then stops again. This occurs until it gets hot, then it starts, and I have no more trouble with it, and it runs well. Could you explain the trouble to me as I am a novice? (2.) The machine does about 50 m.p.g., but I think it ought to do much more.—E.T.

(1.) You might get over the difficulty by injecting a little petrol, placing the machine on the stand, and starting it by pulling over the back wheel, then let it run for half a minute. This should have the effect of warming up the engine, and it should then start easily on the road. (2.) The petrol consumption is certainly excessive. Possibly you have too large a jet fitted, or there may be leaks at the petrol unions—at the filler caps if you fill the tank too full, and at the carburetter float chamber through a piece of grit under the needle. A great deal of petrol is wasted in this manner. You should attend to the petrol level, use as small a jet as possible, and give plenty of air when driving.

Freight Charges to Canada.

I beg to enquire of you as to the maximum cost of sending a cycle car or light car out here to Saskatoon, including all charges both freight and duty, if any; also motor cycle. In this Western country the roads, or rather trails, are not a patch on the worst roads in the Old Country; but for experiences they are unrivalled, as one has to carry almost a miniature workshop on trips of any distance. The one big fault with my 7 to 8 h.p. two-speed twin is the clearance between the crank case and ground, and oftentimes I have to "reverse" (?) and "go on" again, picking my trail as I travel. Quite a difference from riding for miles without having to worry about what kind of road you are going to travel on next, as in England none of these worries confront you. You speak about and also organise hill-climbs, etc., but you should come and try some of our "sand and mud" climbs over here, then you would get all the reliability test you wished for; still, however, it is part of the sport, and one gets used to it. It is a nice sort of experience to ride along in the dark and suddenly find oneself looping the loop over a newly-ploughed field, and then one comforts oneself by reflecting "This is the life." Another nice sensation is running into a slough, or dyke, as it is impossible to see what sort of ground one is coming to on account of keeping one's machine in the trails. However, it is fascinating, nevertheless.—G.K. (Saskatoon, Canada).

The shipping charges from London to Saskatoon for a cycle car or light car, also a motor bicycle, would be as follow: Cycle car or light car not exceeding 25 cwt., or 10ft. 8in. × 5ft. 2in. × 5ft. 3in. when packed, £44 1s. 2d.; motor cycle not exceeding 2½ cwt., or 5ft. 4in. × 1ft 8in. × 3ft. 2in. when packed, £8 5s.; motor cycle not exceeding 3 cwt., or 5ft. 4in. × 1ft. 8in. × 3ft. 2in. when packed, £9 7s. 8d. The above rates include packing and shipping expenses in London and ocean freight, but not insurance, landing, clearing, and delivery expense abroad. We understand the duty on motor vehicles of British manufacture is 27½% *ad valorem*.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"R.B." (Devon). — 2¾ h.p. Lady's Douglas, two-speed, for light sidecar work. Efficiency and reliability.

"E.B." (Kingston).—Omega two-stroke, two or three-speed. Ease of starting, consumption, efficiency, and suitability for touring in hilly districts.

"J.S." (Liverpool).—2¾-3 h.p. Connaught two-stroke. Reliability and petrol consumption.

"J.H.D." (Ireland).—2¾ h.p. Douglas (three-speed), with Rally or Grosvenor sidecar. Speed, hill-climbing, reliability, and upkeep.

"R.G.E." (Gosport).—Babcock bypass fitted to an Amac carburetter on 5-6 h.p. Ariel for slow running.

"C.A.C." (Lancaster).—J.E.S. auxiliary set compared with an average lightweight.

"J.H.J." (Dover).—3½ h.p. A.B.C. T.T. model. Maximum speed, petrol consumption, wear on tyres, and hill-climbing.

"P.D.T." (Glasgow).—3¾ h.p. Victoria. Comfort, speed, reliability, consumption, and hill-climbing, solo, and with sidecar.

"E.G.M." (Saltcoats). — Four-cylinder F.N. Reliability and consumption.

"A.H.D." (Luton).—Grado pulley for 2½ h.p. engine.

RECOMMENDED ROUTES.

CARDIFF TO COVENTRY and distance.—INTERESTED READER.

Cardiff, St. Mellons, Newport, Chepstow, Lydney, Newnham, Gloucester, Tewkesbury, Evesham, Bidford, Stratford, Warwick, Coventry. Approximately 110 miles.

NEWPORT TO HUDDERSFIELD.—E.R.G.

Newport, Usk, Monmouth, Ross, Worcester, Kidderminster, Bridgnorth, Wellington, Hodnet, Market Drayton, Audlem, Nantwich, Crewe, Sandbach, Chelford, Alderley, continuing to Huddersfield through Bollington, Chapel-en-le-Frith, Hayfield, Glossop, and Holmfirth.

LINCOLN TO BIRKENHEAD.—J.R.F.

Lincoln, Saxilby, Newtown, Markham Moor, Bothamsall, Budby, Cuckney, Bolsover, Calow, Chesterfield, Baslow, Bakewell, Buxton, Macclesfield, Knutsford, Nantwich, Chester, Birkenhead.

PORTSMOUTH TO NOTTINGHAM.—R.G.E.

Portsmouth, Gosport, Fareham, Bishop's Waltham, Queen's Head Inn, Winchester, Sutton Scotney, Whitchurch Newbury, East Ilsley, Abingdon, Oxford, Banbury, Byfield, Daventry, Kilsby Lutterworth, Leicester, Loughborough, Nottingham.

HEREFORD TO MILDENHALL.—O.S.P.

Hereford, Ledbury, Tewkesbury, Toddington, Stow-on-the-Wold, Chipping Norton, Deddington, Buckingham, Wolverton, Newport Pagnell, Bedford, St Neots, Cambridge, Newmarket, Mildenhall.

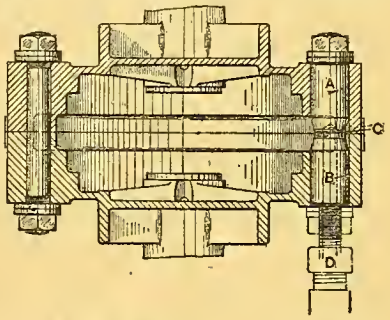
A picturesque cottage near Dryburgh Abbey, N.B. The machine in the foreground is a 5-7 h.p. Abingdon.

PATENTS.

By ERIC W. WALFORD

Crank Case Oil Supply.

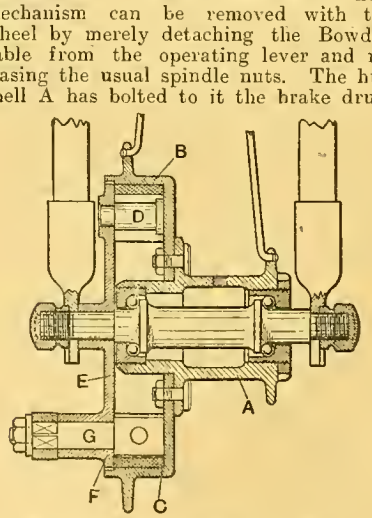
Usually crank cases are cast with a special boss into which is screwed a nipple for the oil pipe. This is dispensed with, and a very neat construction afforded, by the invention shown. One of the crank case bolts A is made slightly larger than usual, and is bored out at



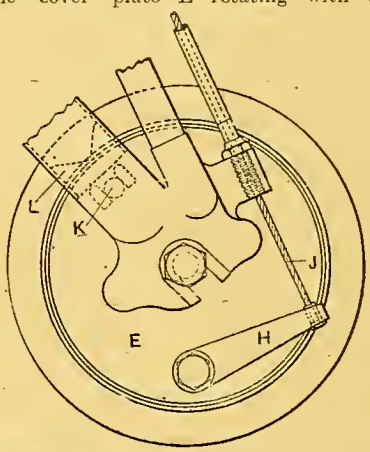
B. At its centre it is reduced in diameter and drilled radially, as shown at C, to afford a clear passage for the oil into the interior of the crank case. The oil pipe is connected to the bolt by a union at D.—Villiers Engineering Co., Ltd., and F. H. Farrer, No. 9,423, 1915.

A Front Wheel Brake.

This is a simple form of enclosed expanding band brake, an important feature of which is that the whole mechanism can be removed with the wheel by merely detaching the Bowden cable from the operating lever and releasing the usual spindle nuts. The hub shell A has bolted to it the brake drum



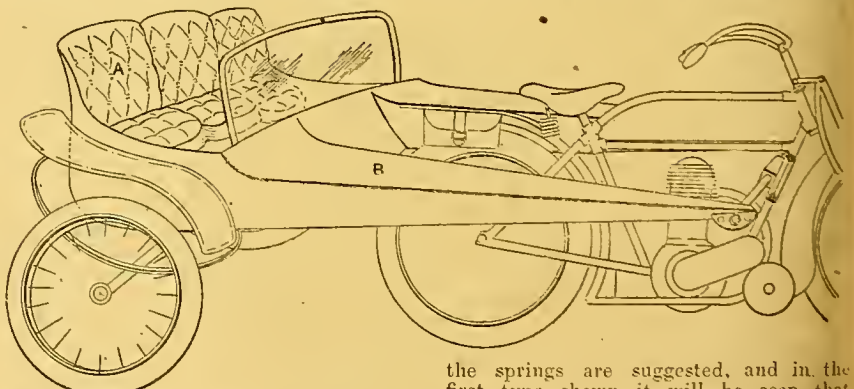
B, the interior periphery of which is acted on by the brake band C. This brake band is mounted upon a pivot D carried by a plate E which serves to enclose the mechanism, and at E affords a bearing for the actuating spindle G, the inner end of which carries an expander cam which opens out the brake band into contact with the drum B. The end of the spindle G is provided with a lever H, to which is connected the Bowden wire J. To prevent the cover plate E rotating with the



wheel when the brake is applied, it is clamped tightly up to a shoulder on the wheel spindle, but an additional safeguard may be provided in the form of a peg K, which may engage the fork end lug L.—Bradbury and Co., Ltd., and L. W. Harvey, No. 18,349, 1914.

A Trailer Revival.

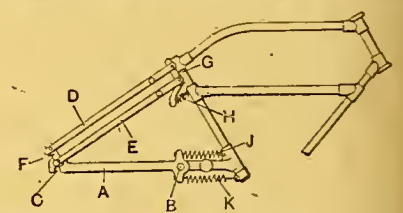
The suggestion that the trailer again be brought to the fore comes rather as a shock in these days of the ubiquitous sidecar combination. The illustration, however, is taken from a recent patent specification, and shows a form of multi-



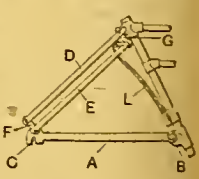
seated trailer A, provided with forwardly extending horizontal trays B, which accommodate the legs of the passengers, and by passing along the sides of the machine somewhat reduce the overall length of the combination. The attachment at the front is by means of ball and socket joints, so that the bicycle may incline to right or left on corners. It will be noticed that, contrary to the old type of trailer, in which the frame was coupled to the bicycle and the body spring mounted on the frame, the present construction has its body attached to the machine, and the axle is carried by springs depending from the body.—C. L. Broadbridge, No. 19,758, 1914.

Rear Springing.

Much attention is now being given to the rear spring suspension of motor cycles, and in the two constructions here



illustrated the chain stay A is pivoted at B, so that its rear end may rise and fall. The slots for the wheel spindle are shown at C, and in each case the usual rigid rear stays are replaced on each side of the wheel by members D E coupled by links F G at each end. The couplings are of a pivotal nature, so that the members D E F G form a flexible parallelogram, which is deformed by movement of the wheel. In the specification various methods of applying



the springs are suggested, and in the first type shown it will be seen that three coil springs H J K are used, so disposed as to resist movement of the chain stays and deformation of the parallelogram In the second type a laminated spring L is employed for this purpose, and affords a neat and substantial construction.—H. S. Bilbe. No. 18,770, 1914.

TYRE BARGAINS

We guarantee all these goods to be quite new and not damaged or repaired.

All goods sent on 7 days' approval against remittance. Carriage forward unless postage is sent.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade Labour Exchange, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

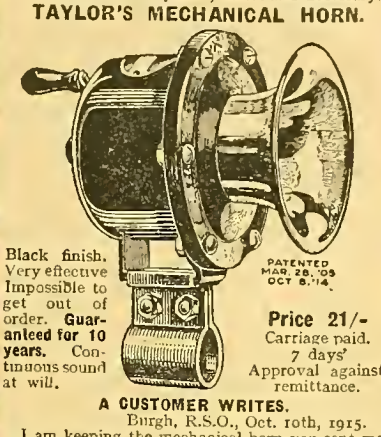
GET IT AT TAYLORS

Four Excellent Adjuncts, useful and necessary.

TAYLOR'S MECHANICAL HORN.



Black finish. Very effective Impossible to get out of order. **Guaranteed for 10 years.** Continuous sound at will.

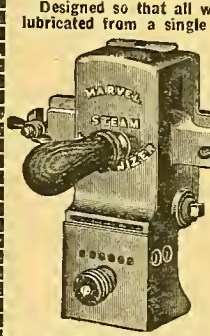
Price 21/- Carriage paid. 7 days' Approval against remittance.

A CUSTOMER WRITES.

Burgh, R.S.O., Oct. 10th, 1915.

I am keeping the mechanical horn you sent me on approval, as I think it quite the best one I have yet seen, and am very pleased with it.—R.R.

Designed so that all working parts can be kept lubricated from a single lubricator.



The 'MARVEL' VULCANISER.

Both Covers and Tubes of any size can be effectively vulcanised. A permanent repair is guaranteed. Saves expense of sending tyres away, and a great saving in time.

Anyone can do it. To prove this, we will forward on 10 days' approval against remittance Money returned, less carriage, if not satisfied. Immediate delivery. Complete with supply of all necessary materials. Price—motor cycle and cycle car size, **13/9**; car size, **27/6**. Carriage paid.

SATISFIED USERS.

Adelaide Street, Bradford.

Dear Sirs,—I received the "steam vulcaniser," and I thank you for your prompt attention. I have tried the machine, and am better satisfied than I expected, as I thought some practice would have been necessary, but anyone following instructions would not have the slightest trouble. When I wished to show my friends the repaired place in cover (the gash was 4in. long), I had to point the places out to them, as they could hardly be seen. Yours truly,

THOMAS WILSON.

Another letter: "I find it quite satisfactory, and very suitable for motor cycle tyres."

TAYLOR'S SIDECAR SAFETY ARM

Converts three-point suspension to four-point. Strengthens sidecar at weakest point. To fit 1⅛" and 1¼" tubes. State size clips required. Price **8/3**. Extra long arms extending to 28", 1/- extra.

Economy and a brilliant and steady light can be obtained by using the

LOW GENERATOR

Full particulars on application.

Motor cycle size, **35/-**; light car size, **55/-**; large car size, **75/-**. In stock.

A Comparison of Old and New Engines.

ALTHOUGH we recently published a letter from a correspondent who wrote in praise of his 1912 machine and compared its performances with those of newer makes, somewhat to the detriment of the latter, it must not, for a moment, be supposed that we agree with the suggestion contained in this letter that new engines are inferior to the models of a few years ago. Possibly our correspondent himself would be slow definitely to make such a statement, but certainly this is the inference to be drawn from his letter.

Just as there are differences between engines of the same make and even of the same year, so also there are differences still more marked between riders, and consequently it must often happen that a good example of a 1912 machine, which has been well cared for and is driven by a rider who knows his engine "inside out," will excel a similar machine of recent make with, possibly, an engine which is hardly "run in," especially if the latter is in the hands of a less skilful rider. It is also true, as pointed out in another letter, which, with others, we publish in this issue on the same subject, that not every motor cycle which stops on a hill has "konked out," nor does every driver who ascends a hill slowly do so simply because he cannot ascend it at speed. It is not difficult to pass another motor cycle on the road when its rider is simply jogging along at his own speed enjoying himself in his own way. In the case of sidecar combinations the weight of the sidecar and passengers has, too, a large influence upon the performance of the outfit, and sidecars have become very much more luxurious, and consequently very much heavier of recent years.

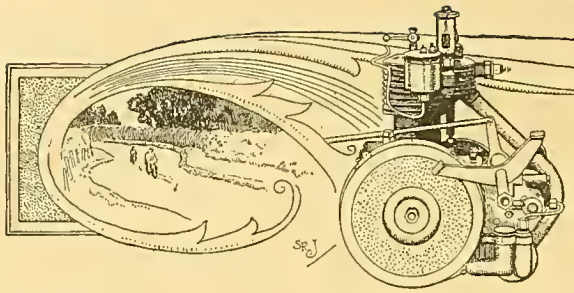
Hill-climbing power is largely a question of suitable gearing, and a really sound machine, which is generally used in flat open country and geared highly in consequence, may in a hilly district find itself at a disadvantage when compared with a less powerful outfit designed more carefully for the work in hand.

A Masterpiece of Mechanical Paradox.

SUCH is the title of an article in the current issue, by a writer of engineering attainments, who criticises very adversely the modern motor cycle engine. We may state, at the outset, that we by no means concur with all the writer's conclusions, though we must confess there is a good deal of sound reasoning in his remarks. Our contributor is severe, particularly concerning the metals used in modern internal combustion engines, and we feel sure that those practical men who take the trouble to study his remarks will be led to consider new paths to possible improvement. After all, the performances of a modern high efficiency air-cooled engine are sufficient answer to many of our correspondent's sweeping assertions. It should be stated, too, that he brings up points of design which were long ago discarded in the leading makes of machines. There are many sides to the question of timing-gear design, but it may be observed here that the external cam has, of late years, been favoured. Large valves are not unknown, and those with a step formation under the valve head have almost sunk into oblivion. But in the matter of inadequate bearing surfaces and undue wear motor cycle engines have undoubtedly suffered for a long time past. His remarks concerning twins are interesting, bringing into the limelight once again the question of the 90° pattern, but the writer does not explain that both this type and the larger size of horizontal twin do not lend themselves to a neat and compact frame construction, though we fully realise that appearance must, in case of necessity, be sacrificed to efficiency.

We commend the remarks to those designers and makers who study all suggestions in a commendable desire to effect improvements wherever they may be possible.

An index to the advertisements in this issue will be found on the page facing the back cover.



Autumn Trips in the South.

A SUGGESTION FOR A SATURDAY AFTERNOON TRIP.

THOSE readers of *The Motor Cycle* who may happen to be on the look out for interesting week-end jaunts cannot do better, should they be Londoners, than try the following route, which is exceedingly attractive at this time of year, when the autumn tints and falling leaves provide such pretty pictorial effects.

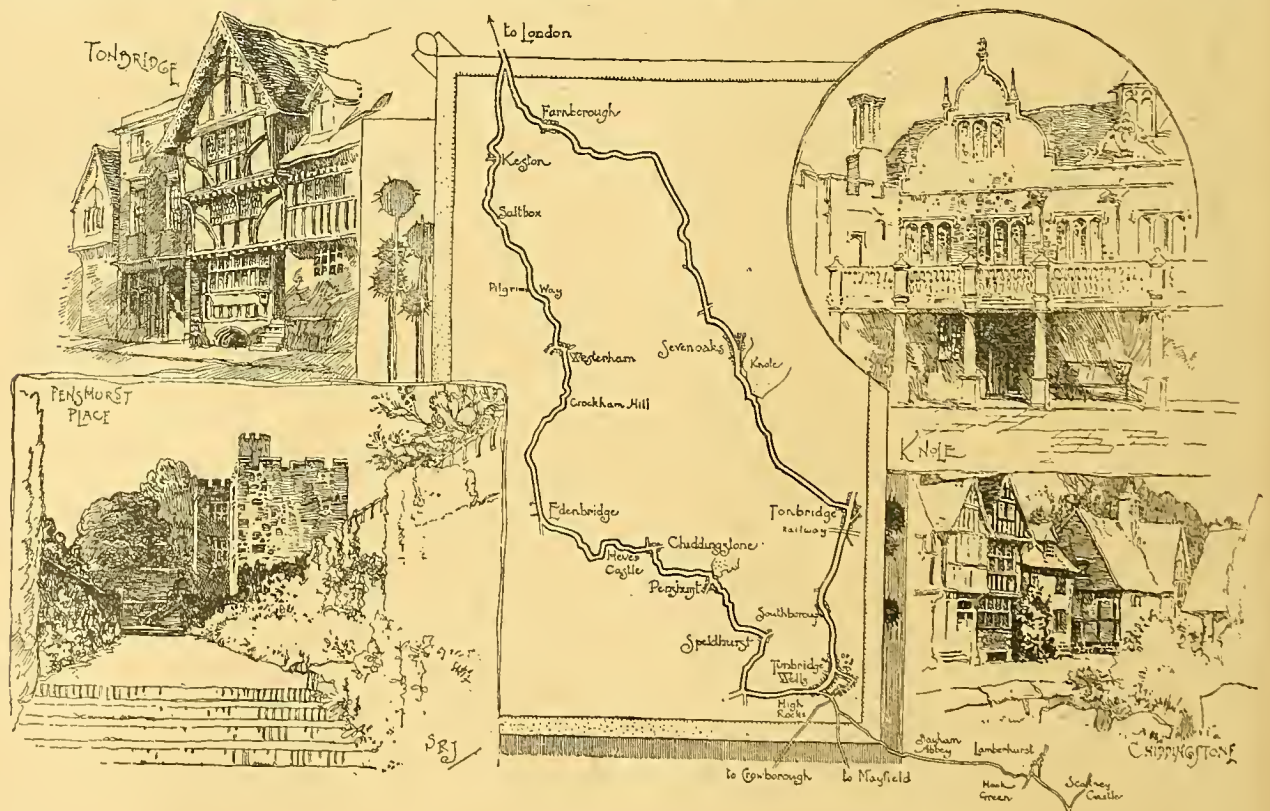
Follow the road to Lewisham Clock Tower, accessible from the West End by way of Camberwell and New Cross. Then take the main Hastings Road through Bromley and Farnborough to Sevenoaks, observing, on the left just beyond Sevenoaks, the magnificent estate of Knole Park, the home of the Sackvilles, one of the most stately mansions and parks in England. Descending River Hill, Tonbridge, with its castle ruins, is approached, soon followed, by keeping to the right at the road fork beyond the station, by Southborough and Tunbridge Wells.

There is much to be seen at Tunbridge Wells—the High Rocks, and the Toad Rock on Rusthall Common, these rocks being of sandstone and assuming large proportions. The Toad Rock is most grotesque, and the Pantiles is a curious promenade in the town. Beyond Tunbridge Wells the road should be taken for Bayham Abbey and Lamberhurst, and then round to Scotney Castle. There is a splendid Trust inn at Hook Green, near Lamberhurst, called "The Elephant's Head," close to the spot where iron was once smelted in days when iron was famous in these parts. There are lovely lanes to explore all round about Crowborough and Mayfield.

The Return Journey.

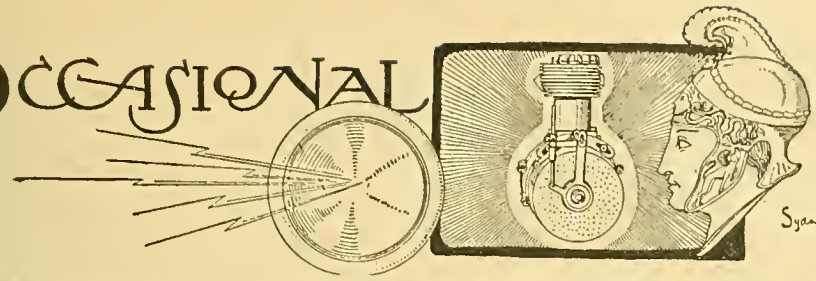
Returning home, the rider should go through Penshurst, with its stately mansion, Penshurst Place, the home of the Sydneys; lovely church and lych-gate. Then there is Chiddingstone, with its quaint cottages and well-known "Castle Inn," and so on to Hever, which castle was the home of Anne Boleyn. From here glorious country continues right away through Edenbridge and Westerham, with its statue of General Wolfe. The way to Bromley and London lies over Westerham Hill, and through Keston, where may be seen some wonderful lakes. Altogether, this run embraces some of the most attractive scenery in the Home Counties

A.B.A.



OCCASIONAL COMMENTS

By 'IXION'



Electrically-started Motor Bicycles.

A reader requests a prophecy on the future of engine-starting, remarking that the modern car will soon be universally fitted with an electrical starter, and that motor cycles cannot lag far behind. I wish I dare make a prophecy on the subject. It would be pleasant to think that as *Anno Domini* gets in its deadly work on my already decrepescent physique, I could look forward to a 1 h.p. (nominal) "baby" capable of climbing Amulree at 40 m.p.h. and fitted with a 2 lb. electric engine-starter operated by a push button on the handle-bar. So far as the immediate future is concerned, I should say the matter is bound up with the survival of the costly high-powered sidecar-puller de luxe; and it is one of the most difficult guesses on earth to say how far a possible cheapening of light cars may knock this pattern of machine off the market. At present, the electric starter does not seem to be making good even on the most luxurious and expensive machines. It increases the strains on the battery (already too large); it adds to the weight, for a dynamo adequate for lighting purposes is barely equal to any additional strains; it complicates the machine—and users are hardly proving themselves worthy of the lighting or lighting-cum-ignition sets as things are; and it pushes up prices. If the big motor cycle *de luxe* loses any ground as the result of competition with light cars, imported or otherwise, the advent of the featherweight electric engine-starter may be far distant. After all, what is the matter with a decent kick-starter? No electric starter can ever hope to compete in first cost, reliability, and cheapness of repair with a device which consists merely of a pedal, a spring, and a few cogs.

Clergy and the Petrol Tax.

It is extremely doubtful whether the Exchequer will listen to the appeals of a few clergy who desire relief from the petrol tax. Their case is by no means on all fours with that of a doctor. The doctor pays, on an average, at least forty visits per diem, so that the time-saving qualities of the motor are invaluable to him. It is frequently necessary for him to reach a patient as rapidly as possible. The time between visits is short, and he must refresh his memory about a case between one door and the next (and dispensary work occupies him till the moment of starting out). In bad weather and at night he should reach the patient with warm hands, as he may have to handle the naked flesh. His visits cannot be confined to a given locality on a given day, but are dotted about all over his round, which usually covers from six to ten ecclesiastical parishes. *Per contra*, who ever heard of a parson who habitually paid from 200 to 300 visits per week; more probably forty is nearer the clerical average. The parson can refresh his memory about his flock before leaving home. It is seldom necessary for him to go out late at night; nor is it then necessary that he should arrive warmer than walking can keep him. His visiting, except in comparatively rare emergencies, can be and is confined to a single corner of a single parish. Or one can put it this way. The doctor's need of a time-saving and protected means of locomotion was such that, prior to the motor era, nine doctors out of ten used horse-drawn vehicles, usually admitting of cover during bad weather, whereas not one parson in a thousand, either then or now, finds anything more ambitious than a bicycle essential to his duties. My own vicar, who is another "Sparting Porson" (to borrow our correspondent's nomenclature), tells me that he uses his motor bicycle on one day in each week for pastoral purposes in order to cram his visits to outlying members of the congregation into a single afternoon, but that his push-bicycle serves the purpose quite as well. In a previous parish, of the straggling rural order, he habitually covered sixty miles per week in pursuit of his pastoral duties, but this mileage was totted up simply in reaching one village or another, where the rest of the afternoon or evening was spent, so that Shanks' pony or a push-bicycle would have been equally serviceable.

Motor Cycles for Professional Purposes.

Our correspondents have, however, raised a much larger question, in that there are a host of minor professions in which the motor bicycle and cheap multi-wheelers, like the Morgan runabouts, are being increasingly used. One Morgan of my acquaintance is used by a wholesale grocer, whose clients are the village chandlers' shops spread over half a county. His work is such that he might conceivably get a pleasure trip on Sundays, but for 313 days out of the 365 it is used exclusively for business. There are others, including itinerant chapmen and canvassers and agents who use similar cheap locomotion in work which is professional to the extent of 75% at least of the mileage. It may seem unfair that an occasional trip for pleasure at the week-end should deprive such users of the rebates extended by law to—for example—large multiple firms owning delivery vans used exclusively for business. The problem of relief is thorny. When Jones, who is a bit of a nut and speed merchant in private life and an insurance canvasser in business hours, is seen gaily tuf-tuffing down the road, who is to say whether he is bent on pleasure or business? Is he going to wring overdue premiums from a reluctant policy-holder, or is he going to sit on a gate in the gloaming with the policyholder's pretty tweenie? Supposing rebates of licence and petrol tax were deemed desirable for all motorists who can prove that 75% or upwards of their mileage is covered on strictly business purposes, how are the claims to be tested and verified? Will the

Occasional Comments.—

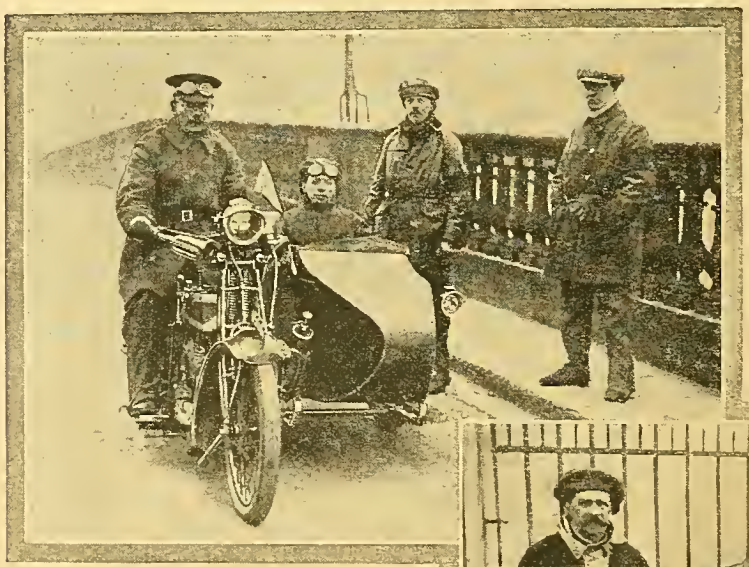
claimants have to keep a precise log book of all their journeyings and show it to a detective on demand, or what? I think it quite possible that the idea may be considered after the war, though from a somewhat different standpoint. Money will be tight, and the Government will desire to cut down luxurious expenditure. Professional users may not get relief, but attempts may be planned to super-tax the pleasure motorist whose petrol is exclusively consumed in joy riding. If such distinctions are made, it is more probable that they will be applied to the licensing process than to the fuel.

Better Now, Thank You.

The other day a low, stertorous moaning was audible throughout the office; the staff rushed hastily into my sanctum, and, after some good work with the sal volatile, I recovered sufficiently to hand our Brooklands expert the cause of my fainting fit. I had hoped that my innate modesty protected my writings from any semblance of omniscience, but it is not so. One of our naval nuts, at present "somewhere in the North Sea," had written asking me to frame handicaps for a timed hill-climb and one and five-mile sprints, to be contested on the next afternoon ashore by a baker's dozen of bicycles, ranging from a 1910 lightweight to a 1916 10 h.p. Some of them had single gears, some of them had three speeds. The timing arrangements were to be of the makeshift order, and no weighing was possible. We rang up Brooklands, and the track bulbous-brains soon scented trouble and regretted they were frightfully busy. In the meantime, ye bespectacled makers of formulæ, here is a problem for your leisure. Given a hill of unknown length and gradient, in the absence of a weighing machine, how much start should a 9 h.p. ported and stripped 1916 solo racer allot to (a) a 1910 two-speed 3½ h.p. with coach built sidecar, and to (b) a 1915 single-geared baby two-stroke? I appreciate the compliment of this letter, but, like Uriah Heep, I very 'umbly confess myself unequal to the occasion.

SCENES IN THE COAST-TO-COAST DESPATCH RIDE.

(See page 399 of the last issue)



(Upper) The 6 h.p. A.J.S. sidecar outfit ridden by "Sergt." Fletcher, of the Sheffield Volunteers (Motor Cycle Section). Fletcher made splendid running, and was the only man to complete the whole journey.

(Lower) "Private" Dover replenishing the tank of his Indian during a brief halt.

ROAD REFORM.

A Central Authority Wanted.

A road may be likened to a carpet spread upon boards, as it consists of a surface laid upon a foundation. Many rural road authorities have displayed an incredible foolishness. No sane householder would be so idiotic as to put down a costly pile Brussels carpet upon naily, worm-eaten and undulating floorboards. But year after year many traffic authorities are guilty of a parallel crime. They calmly deposit extremely expensive tar surfacing upon a road foundation which was barely equal to the slow horsed traffic, which was its sole burden twenty years ago. When the foundation disintegrates the costly superstructure within three months, they lift pious hands in horror and denounce motoring and motorists. Sooner or later we shall have to face the reconstruction of the entire *foundations* of many important roads. But a sane roadway system is hardly practicable so long as the business is entrusted to local enterprise and local prejudice. We stand in crying need of a centralised road authority.

MILITARY NOTES.

Use of Sidecars Extending. Scott Sidecars which Reverse.

SIDECARS INSTEAD OF CARS FOR OFFICERS.

AS we have before hinted, sidecar outfits are now being used in various branches of Army work, in addition, of course, to the motor machine gun batteries. We have a letter before us from a motor cyclist in France who has been driving his Commanding Officer about on tours of inspection on a Clyno outfit, which, he says, is well suited for the work, as it is easy to handle and has a good turn of speed. Improvements suggested to meet the extraordinary condition of some of the roads after heavy shell fire are stronger front fork springing and stronger sidecar springs.

REVERSING A SCOTT.

THE other day a well-known motor cyclist told us that he had seen a Scott motor bicycle with a reverse gear. When we doubted such a thing, he renewed his assertion, and said he saw a Scott actually reversing in a Government yard, and the machine was one of the R.N.A.S. sidecar outfits.

An explanation of the occurrence is now forthcoming from a petty officer in the Royal Naval Air Service, at present in the Mediterranean, who was moved to write us by seeing a copy of *The Motor Cycle* and noting the photographs of many Royal Engineers he had met, and whose photographs were reproduced. He commences, "You can imagine how pleased I was to pick up a copy of *The Motor Cycle* while in hospital at Malta." He informs us that the machines were fitted with Splitdorf magnetos, and with these magnetos it was possible to drive along, put the lever into the free-engine position, advance the spark, close throttle, and just lift the half-compression valves, when on letting in the low gear again the machine would reverse. This method of reversing a two-stroke engine is used on most two-stroke marine engines. It is not easy, however, to do it with magneto ignition, as a magneto only gives the best possible spark when fully advanced; therefore, in order to obtain sufficient advance to reverse the engine, it would have to be only half advanced or even less when running in the ordinary way.

Sergt. H. Karslake, of the No. 1 Squadron Royal Flying Corps. Karslake will be better known as one of the most prominent members of the Motor Cycling Club, and a consistent participator in all the big long-distance trials. Our present duty is to offer him our congratulations upon his engagement to Miss Mary Reid, of Fraserburgh, herself a well-known motor cyclist.

According to our correspondent, *heavy* motor bicycles are not favoured in the countries where the Mediterranean Expeditionary Forces are operating, as the roads are almost impassable, and a number of riders have been injured through having to keep their feet on the clutch continually. "This is where the hand control scores," the P.O. sensibly remarks. It is not possible to use sidecars on the roads in question.

The writer and his friends, together with other members of the R.N.A.S., were trained with their machines, and then at the last moment had to be sent out as infantry, with full equipment and also a tripod and a quick-firing gun.

This is not a man on a motor cycling camping tour, but a despatch rider attached to a cavalry corps with the B.E.F. The rider, Corpl. J. N. Johnson, has covered a big mileage over roads of all descriptions on his Douglas.

BROTHERS IN ARMS.

A fine record—four brothers who are in the Army photographed together in France quite recently. From left to right: Sergt E. P. Williams, A.S.C.; Corporal Eric Williams, despatch rider, R.E.; Corporal G. H. Williams, R.A.M.C.; and Corporal L. J. Williams, despatch rider, R.E. It is hardly necessary to add that the second man is Eric Williams, of Tourist Trophy fame, and the writer of a very interesting article on the work of a despatch rider that appeared in *The Motor Cycle* in the spring of this year.

WELL-KNOWN RIDER AS MILITARY INSTRUCTOR.

CORPORAL W. PRATT, a photograph of whom we published a fortnight ago, is now at an A.S.C., M.T., camp at Catford instructing recruits in the handling of motor lorries. New men are taken all round the Kent hills, such as Cudham, Salt Box, Chalk Pit, and Westerham, and, as Pratt says, a 5-ton lorry is not an easy machine with which to make starting and stopping tests upon on hills of this nature. Despatch riders are, of course, trained on motor cycles, Douglases and Scotts being used at the Catford camp.

Referring to the proposed munition workers' trial, Corporal Pratt considers a one day trial, after the style of the A.C.U. Quarterly Trials, would receive excellent support in the Catford district.

Pratt, by the way, was not invalided home, but sent back to act as a motor cycle instructor after eight months at the Front, and suffered his ankle trouble whilst on service in this country. He is now married to the lady shown in the sidecar in the photograph reproduced on page 574 of *The Motor Cycle* of a fortnight ago.

THE MODERN MOTOR CYCLE ENGINE.

"A Masterpiece of Mechanical Paradox."

FROM the enthusiastic rhapsodies of the technical press, we might reasonably believe that the modern motor cycle engine was a triumph of the engineering science, but there are reasons for not agreeing with this—it would seem—almost universal idea.

Taking the engine part by part and carefully examining each detail, we notice the following peculiarities.

Piston.

The modern piston is unduly heavy, and, in addition to weight, many types have parallel sides, thus bringing into play a large amount of unnecessary friction. The rings are relied upon to such a small extent that even three are sometimes used. It is fitted with a gudgeon pin as small as the designers dare make it in section, and, not content with this, they, having the choice of a bearing surface for the little end of either 2½in. or ¾in. long, choose the latter; finally, to obtain a large output with ease, a material unsuitable for high speed reciprocating motion is used, viz., cast iron.

Connecting Rod.

The importance of weight is here again paramount, so, with characteristic ingenuity, the designer stamps it out of the solid into a shape which bears no very clear relation to the function which it has to perform. At its lower extremity we come to a bearing which, as it takes the full thrust of the engine, is made as small as possible consistent with safety and of a design which requires copious lubrication. Successfully to avoid the undue flooding of the bearing, flywheels are ingeniously applied to each end, and perform their work with gusto in adding pounds of unnecessary weight to the engine, in making very apparent the viscosity of the oil agitated between their peripheries and the crank case, and, as before mentioned, draining by centrifugal force all oil which by chance happens to go near the big end and main bearings. As in the case of the piston and probably for the same reason, cast iron is again the material selected for their construction. In a few cases, one flywheel is adopted and is placed outside, where, however, the section immediately becomes unsymmetrical; one which develops unequal strains on different parts, *i.e.*, the two faces being invariably adopted.

The Main Shaft.

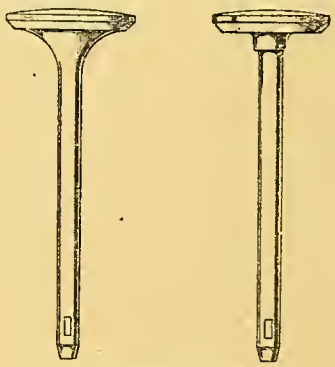
This should be quite rigid, and is again unaccountably made in five separate and distinct parts, the joints of which must be made readily detachable or the machine cannot be dismantled (a very necessary and far too frequent operation); these joints are rather prone to work loose, which, of course, does not improve the running.

Timing Gear.

At present the cam appears to be a necessary evil, but why are inside ones so prevalent? One fails to see any advantage, and the following disadvantages are immediately apparent. The perimeter of the cam face is smaller for the same size of cam, thus causing quicker wear. The cam itself is more costly, it being more difficult to produce than an outside cam. The force of the lift has to be carried round the projecting rim, thus making for unnecessarily strong construction and consequently more weight, and, what is far more detrimental, more inertia in the moving parts. Continuing our survey, we come to the tappets, which, if not of the obsolete, antediluvian and pre-historic non-adjustable type, are still unmechanical, being generally offset. This arrangement, whilst suitable for the non-adjustable type, is totally unnecessary now, a large side strain being imposed on the guides, causing a tendency to bind. Perhaps (dare I whisper it) it is because the makers have not troubled to alter their cylinder or timing gear patterns.

Valves.

Every year we hear of valves being made larger, but why only a millimetre at a time? Small valves mean big lift, big lift means thick heavy heads; this again means thick stems. In turn we get stronger springs to obtain quick drop, and, as a result, broken valves and worn timing gear. The side by side position is an abomination; valves certainly should not be interchangeable, they perform different functions and should be of different design. The exhaust valve cap is a fruitful agent of pre-ignition, and long valve stems and tappet rods are inevitable with this system; besides, think of the distorted cylinder and combustion chamber. One side of the valve chamber supplied with a freezing mixture, and the other traversed by a particularly powerful blow pipe flame; all in one piece with the cylinder, which under these conditions quickly loses any pretension to cylindrical form it once had. Overhead valves are infinitely preferable, and surely they can be prevented from falling into the combustion chamber without being made weaker in the stems. But, although overhead valves are the thing, the method of operating them is really amusing. At present the valves have to be operated from a distance, and as a rod in compression has to be made much stouter than one in tension, the former is selected because it is heavier and more massive (a British characteristic). In using this ingenious system of transmission, power is transferred to a distance by reciprocating motion. (Most mechanical!) Also the pivot for the rocking lever, which is mounted on the cylinder head, is necessarily subjected to twice the strain on the tappet rod. (More weight!) The neck of the valve is a most vulnerable part, and most valves yet are not stout enough here.



Types of valves showing good and bad design.

The Modern Motor Cycle Engine.—

Cylinder.

Now we come to the masterpiece of design, cast iron in tension (ye gods!); this portion of the engine performs the functions of radiator, boiler, compressor, guide bars, frame, and serves to hold rigidly valves, carburetter, and rocker arms, and is wholly and entirely composed of that paragon of all the virtues, cast iron. Admittedly, the fins are now cast with much greater care than formerly, and in a very few cases have been made so deep that the edges are always comparatively cool, but cast iron is not one of the best conductors of heat we possess, and consequently, as the heat cannot be carried away sufficiently quickly, low compression is universal even for Brooklands racing models, and even then konking is not unknown. The fins also have not the right section; a parallel-sided fin is not in accordance with science.

Coming now to the crank case where the otherwise prevalent cast iron could be used with advantage, what do we observe? This: a material is used closely resembling hard cheese in consistency. We have heard it announced that this is permitted on the score of reducing weight (which is apparently neglected elsewhere). As a result, the timing gear is either losing its screws, or else the threads are quickly rubbed over and stripped. Who has not seen loose cylinder studs? Gear boxes are in the same plight, and some makers are finding out that bearings have to be supported by bronze rings let into the aluminium. One specimen has an entire skeleton frame inside.

Balance is also a good point in an engine. Probably this is why so many singles and "V" twins are made. The 90° twin is sometimes noticed, but here we are confronted with uneven firing periods, and also the difficulty of properly building it into a frame. The horizontally opposed twin (with slight alterations from present practice) is undoubtedly the engine of the future.

Other Details.

The magneto governed on the contact breaker; oiling on the hit and miss splash system; carburetter which as far as one can see has two superfluous controls, and not the ones necessary. Exhaust pipe which has either to turn sharp corners, or else run straight into a box, thus doing away with any scavenging action. Gears with arbitrary step ratios, non-weatherproof or inaccessible transmissions, rigid frames, and spring forks which only take shocks in one direction (some models recently improved).

There are a few makes on the market which have been shorn of some of the above defects, but on the whole they are common to the general design of engine and cycle.

There is too much finality of design in the trade at present, and the talking points of new models are rather in the pump clips, back stands, different coloured enamels, and "our vastly improved and unapproachable registered design of compression tap handle," than in any mechanical improvement.

Given time one could pick out many more points of interest to talk about, but there are here sufficient for the time being. Finally, the writer is an enthusiastic motor cyclist. He rides, and enjoys doing so, that "masterpiece of mechanical paradox," a motor cycle.

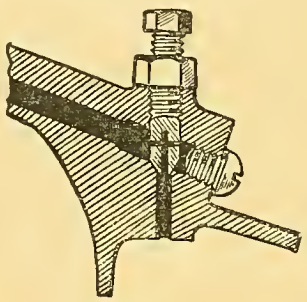
· MANUFACTURERS' PROGRAMMES FOR 1916 ·

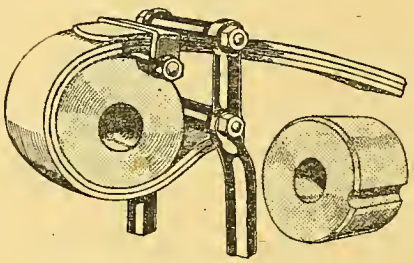
AUTO-WHEELS FOR 1916

THE popular Auto-wheel has only been improved in minor details for the coming year. The accompanying illustration of the power unit clearly shows the construction of this interesting little engine. The section is particularly well made, and all the working parts are clearly exposed to view.



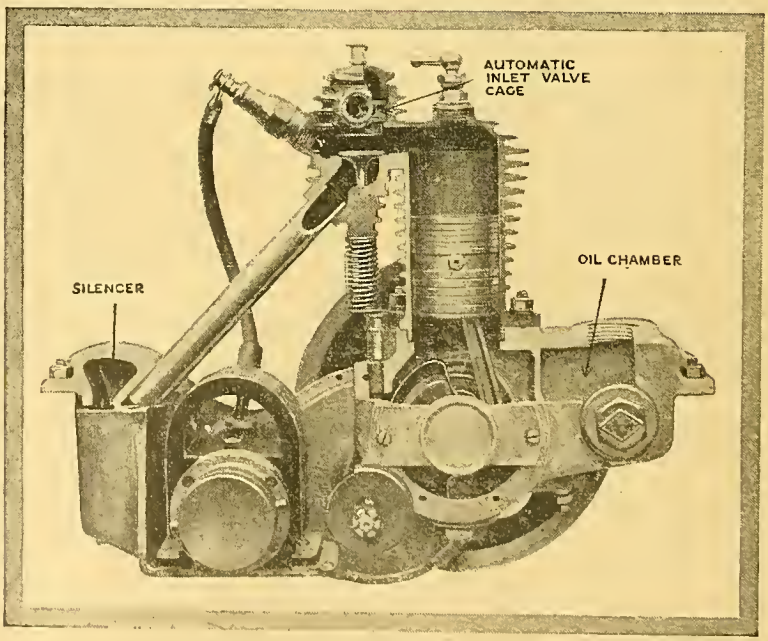
Oil-adjusting screw on the Auto-wheel.

The oil chamber will be seen on the right, while on the extreme left is the silencer, which also forms part of the aluminium casting. One of the most interesting features about the Auto-wheel is the system of lubrication, which is arranged on the bird fountain principle. It is in the lubrication that the chief improvement of the latest model Auto-wheels is embodied. The hole shown in the small screw regulates the quantity of oil which is allowed to pass to the engine. It is necessary that this passage should be cleaned about every 1,000 miles. The new device is claimed to effect economy in oil consumption, while it also enables the engine to be adequately lubricated.



A FRONT FORK SHOCK ABSORBER.

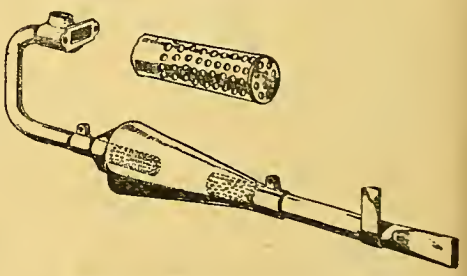
A shock absorber designed by Mr. S. George, the well-known Indian rider. It is made of rubber, and is inserted in the scroll of the front fork of Indian motor cycles. Mr. George is placing the shock absorber on the market from 3, Mornington Place, Mornington Crescent, N.W.



Sectional view of the latest Auto-wheel engine.

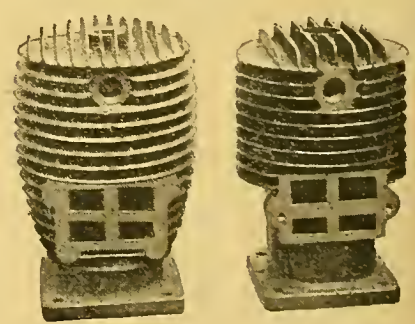
1916 MODEL OMEGA.

THE Omega machines for 1916 are almost identical with those of this year. The firm has made no radical changes, but several minor improvements have been effected. The silencer, as will be seen from the sketch, is of a somewhat unusual shape, and is found to be most efficient. It consists of a cone-shaped expansion chamber into which two pipes are thrust—one at each end. The ends of the pipes which enter the silencer are pierced with holes which, while forming a baffle for the exhaust gases, do not to any extent interfere with their escape. Another improvement has been made to stop the leakage of oil from the crank case by way of the engine-shaft bearing. Oil leaking in this way is caught by a groove which is cut in the bush and passed down a hole bored through the centre thereof, where it meets another hole bored through to the inside of the crank case.



Silencer for 1916 model Omega two-stroke.

The piston has undergone a slight alteration—the top portion, instead of being curved, is now made with a plane slope; this is said to aid scavenging. The Omega machine presents a very pleasing appearance.



1916 (left) and 1915 two-stroke Connaught cylinders compared. Notice that the radiating ribs have been extended. The new Connaughts were dealt with on page 369 of October 14th.

The
FIRST
MOTOR BIKE
to attain a speed of

AGENTS! We want live agents. The proposition is attractive—a splendid machine, a moderate price, and early delivery.

BOWDEN WIRE LTD. LONDON

PRATT ST. N.W.

Established 1897.

BOWDEN WIRE MECHANISM
For effectively controlling all movements from the handle-bar. Made in various strengths and finishes.

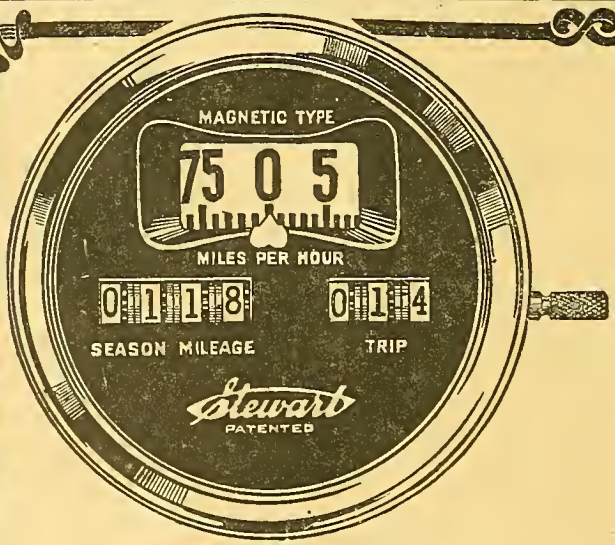
BOWDEN CONTROLS.
Levers for Brakes, Clutch, Air Inlet, Magneto, etc., controls. Made for right or left hand, for one to three movements.

BOWDEN TWO-SPEED GEAR.
A very simple countershaft gear with kick-starter. Can be fitted to a number of machines without any—to most with slight — alteration. Guaranteed for engines up to 6 h.p.

BOWDEN RAPID VALVE GRINDER.
Helps to grind a valve quickly and with absolute accuracy without dismantling the cylinder. Most efficient. Acts also as Valve Spring Lifter.

STOPS, PORTABLE CLIPS, etc., and all necessary fitments for use with Bowden Wire Mechanism.

Godbold.



IF YOU ARE LOOKING

for the best motor cycle speedometer that money can buy, here it is. It's the "Stewart" model for motor cycles, and is of sturdy build and unimpeachable accuracy. The recording is so accurate, the working so dependable, one can rely implicitly on the correctness of the figures given, whatever be the speed or conditions of travel. The figures, too, are so large and clear that he who scorches can read.

Model R (illustrated) registers from Zero to 75 miles, season mileage to 10,000 and repeating, and 100 mile trip register. Heavily nickelled finish, and nickel flexible shaft, complete the most wonderful value in Motor Cycle Speedometers ever offered.

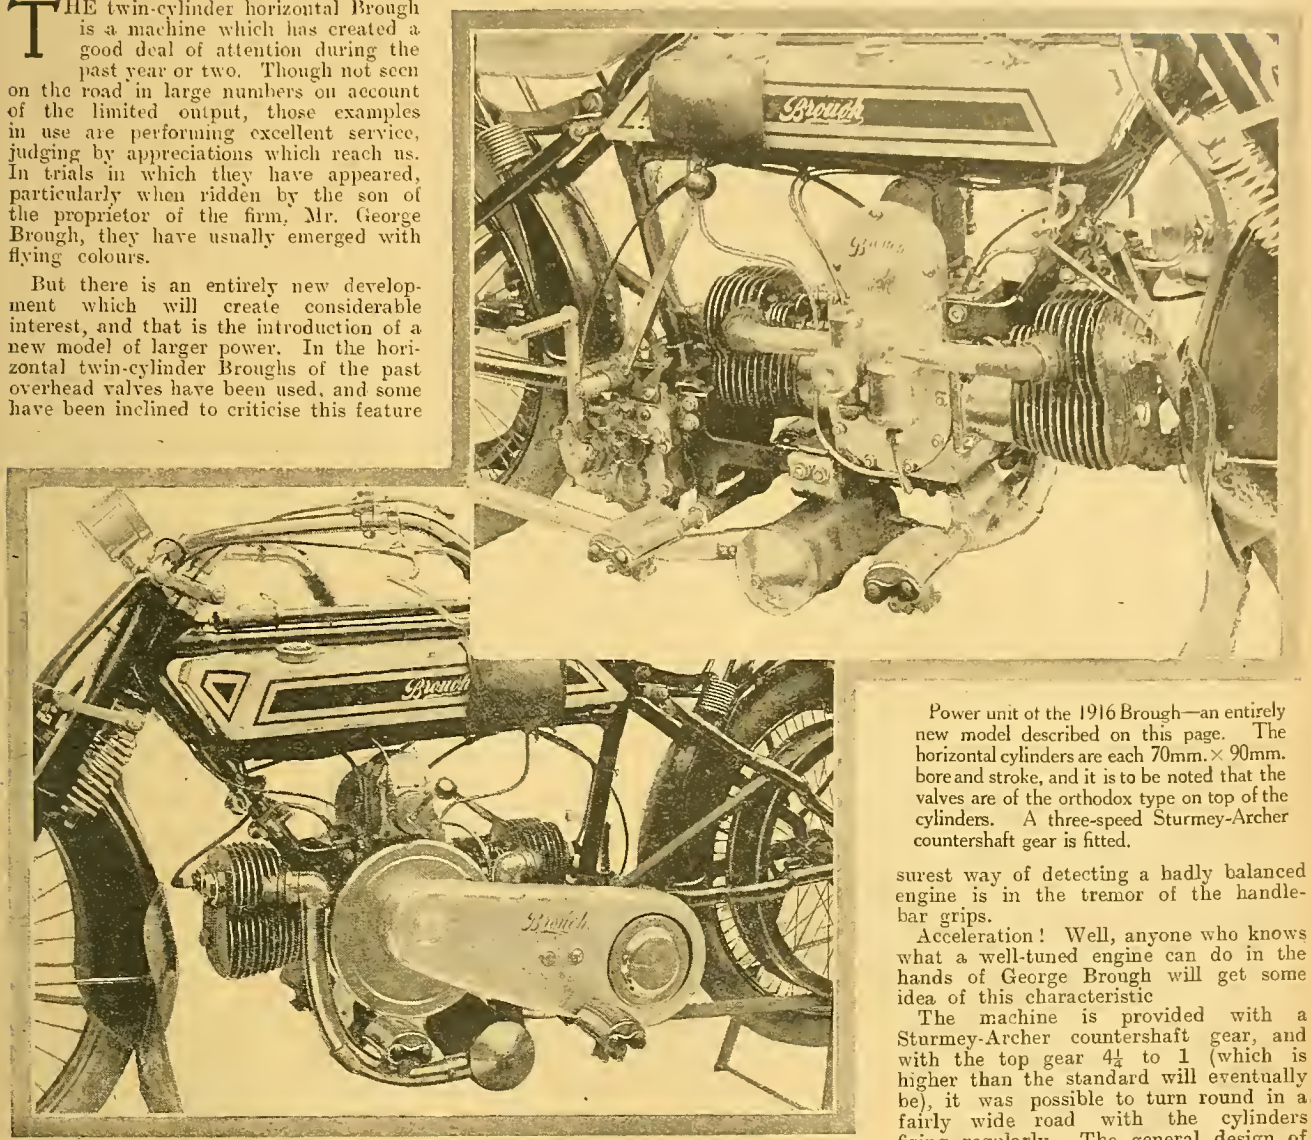
A 6 h.p. Horizontal Twin Brough.

Road Tests and Description of an Entirely New Model.

THE twin-cylinder horizontal Brough is a machine which has created a good deal of attention during the past year or two. Though not seen on the road in large numbers on account of the limited output, those examples in use are performing excellent service, judging by appreciations which reach us. In trials in which they have appeared, particularly when ridden by the son of the proprietor of the firm, Mr. George Brough, they have usually emerged with flying colours.

But there is an entirely new development which will create considerable interest, and that is the introduction of a new model of larger power. In the horizontal twin-cylinder Broughs of the past overhead valves have been used, and some have been inclined to criticise this feature on a touring machine, though their efficiency is well known, but on the new model, which we had the pleasure of inspecting and trying last week, the valves are arranged in the orthodox manner, the valve chambers being arranged on the top of the cylinders. As a matter of fact, the cylinder design closely follows the 6 h.p. V type Brough of a year or two ago. The dimensions of this new twin are 70 × 90 mm., giving a capacity of 346 c.c. per cylinder.



Power unit of the 1916 Brough—an entirely new model described on this page. The horizontal cylinders are each 70mm. × 90mm. bore and stroke, and it is to be noted that the valves are of the orthodox type on top of the cylinders. A three-speed Sturmey-Archer countershaft gear is fitted.

In other features advantage has been taken of the experience gained with the 3½ h.p. twin.

This new engine, though designed as a double purpose mount, is primarily intended to appeal to that section desiring a motor bicycle for passenger work which shall be of moderate weight, and consequently not too cumbrous for occasional solo work. Silence and flexibility are its chief characteristics.

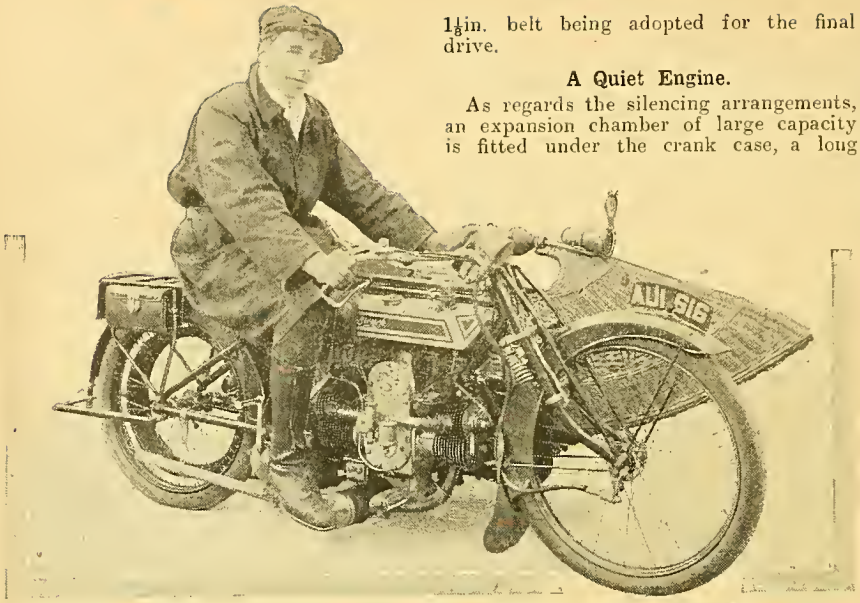
The Result of Experience.

It should be explained that this model, though new to the public, is by no means an experiment, having been on the road for some months past, and being driven under all conditions for many thousands of miles. What impressed us more than anything else during our road test was the absence of effort so noticeable about this wonderfully smooth running engine. We sped along at all speeds with the same comfort and smoothness that one would associate with a high-class car, whilst the handle-bars are noticeably free from vibration, no matter whether it was 20 or 40 m.p.h. at which we travelled. We particularly applied this test while seated in the sidecar, knowing that the surest way of detecting a badly balanced engine is in the tremor of the handle-bar grips.

Acceleration! Well, anyone who knows what a well-tuned engine can do in the hands of George Brough will get some idea of this characteristic

The machine is provided with a Sturmey-Archer countershaft gear, and with the top gear 4¼ to 1 (which is higher than the standard will eventually be), it was possible to turn round in a fairly wide road with the cylinders firing regularly. The general design of the engine will be gathered from the accompanying illustrations. Some minor alterations and improvements will, however, be effected before the machine is ready for the market.

Roller bearings are used throughout, *i.e.*, the camshaft, magneto timing shaft, as well as the magneto shaft, revolve on rollers. The lubrication system is not definitely decided upon at the moment, as a pumping system is under consideration. The countershaft is a splendid piece of work, and is noticeably free running. The pistons, which have flat tops, are provided with two rings, as well as the keeper ring for the gudgeon pin. The flywheel is, of course, of the outside type, the chain sprocket being mounted outside the wheel and driving a three-speed Sturmey-Archer countershaft gear, a



New model 692 c.c. Brough horizontal twin-cylinder sidecar outfit with George Brough at the helm.

1⅛in. belt being adopted for the final drive.

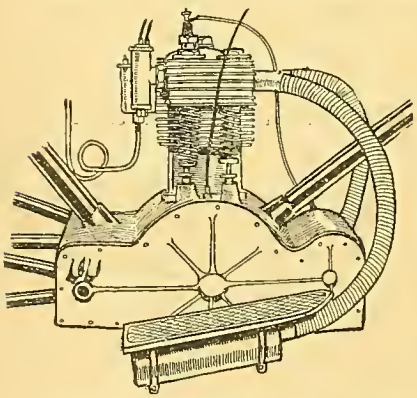
A Quiet Engine.

As regards the silencing arrangements, an expansion chamber of large capacity is fitted under the crank case, a long pipe conveying the gases to the rear. This new Brough twin is of the low compression type—indeed, Mr. Brough has been an exponent of the low compression engine for years past—but nobody could associate inefficiency with low compression, as instance the remarkable performances of Brough riders in the most severe trials of the past. And as to controllability in the hands of ordinary riders, there is no doubt that low compression is to be preferred. As for "revving," it may be mentioned, that on the middle gear of George Brough's outfit a speed of nearly 40 m.p.h. was attained. In the bicycle itself there is very little alteration, the machine following standard lines practically throughout, but in the new engine we feel convinced that Messrs. W. E. Brough and Co. have a proposition which will make a strong appeal to the buyer who desires a passenger machine of moderate weight, easy to start, easy to control, yet smooth and quiet in running. The engine, though well up to its work, is not of such a capacity or weight as would spoil the machine for solo work when desired.

A Monobloc Motor Cycle Engine.

Magneto, Clutch, and Gears under One Cover with Crank Case.

A FEW days ago we had an opportunity of examining a motor cycle the design of which is both interesting and unusual. It is purely an experimental machine, and has been on the road for some time.



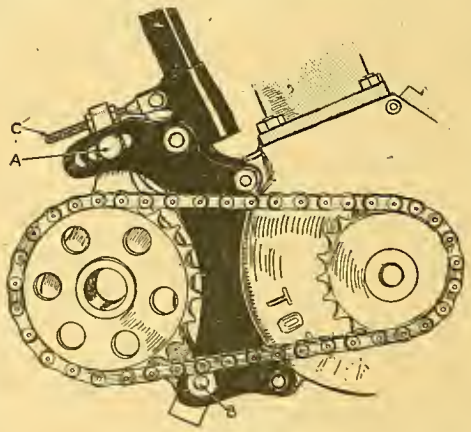
Novel system of design for a power unit. The clutch, gears, and magneto are enclosed in extensions of the crank case. Note also twin exhaust pipes and silencers.

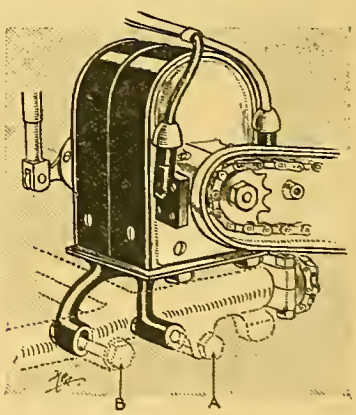
The accompanying sketch shows where the chief interest lies. It will be noticed that the down tube and seat pillar are brazed to lugs cast as part of the crank case; the latter has two extensions, one at the front housing the magneto, and one at the rear containing the gear. Thus the crank case serves three purposes, as its forward compartment conceals and protects the magneto entirely, while the gear box is in the one unit. To make the interior mechanism accessible for adjustment or repair, two large aluminium plates are bolted to either side of the crank case, and, by undoing the securing screws, the whole of the engine and gear box mechanism is exposed.

The flywheels are inside the case, but a train of gear wheels drives the reduction gears instead of the more usual engine to gear box chain. A small sliding cover could make the contact maker of the magneto accessible, and obviously the mechanism of the latter is running under ideal circumstances, as it is free from mud and dust.

It will be noticed that the exhaust pipe is divided and two flexible pipes conduct the gas to twin silencers below the footboards, while the chain stays are duplicated, projecting from the rear of the gear box. A single chain drive is fitted, the sprocket being on the left-hand side of the machine, and the clutch operating mechanism is fitted to the lugs shown on the right-hand aluminium cover.

As at present constructed the machine is heavy, but a few alterations should bring it into competition with the more normal design, and the result might be a machine very much more easy to clean—a good point to aim at, and one that would be appreciated by all riders.





REFINEMENTS IN THE NEW ZENITHS.

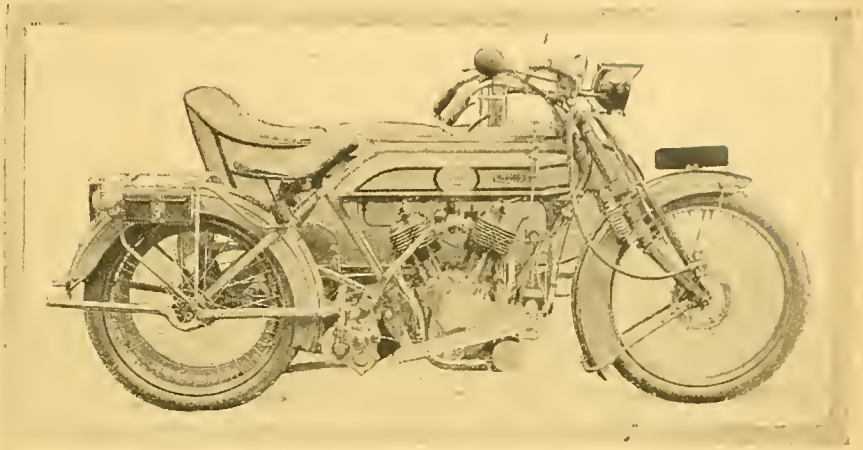
(See description page 402 of the last issue.)

(Left) Transmission chain adjustment. The clutch casing is pivoted at the bolt B. To adjust chain the nut A is unscrewed and the clutch casing moved as desired by means of the adjuster C. (Right) Method of carrying the magneto. The bracket is pivoted on the bolt A. When required to adjust magneto chain the nut B is loosened and the leg of the bracket having a slotted hole, the bracket may be tilted back, and thus the slackness in the chain may be taken up.

6 h.p. Vindec Sidecar Outfit.

A New Design under an Old Name.

ONE of the best motor cycle productions ever placed on the market by Messrs. Brown Bros., Ltd., Newman Street, W., is the 6 h.p. Vindec passenger outfit. This is a remarkably smart combination, well-equipped and well-designed, and sold at quite a moderate price. The motive power is a 6 h.p. J.A.P. engine, which is supplied with gas from an Amac carburetter. Oil is fed into the crank case by a Best and Lloyd lubricator. A priming arrangement is fitted, but only feeds to the rear cylinder, which has been found to be absolutely adequate; in fact, we saw the engine started from cold at the first kick of the pedal. A Dixie magneto is fitted.



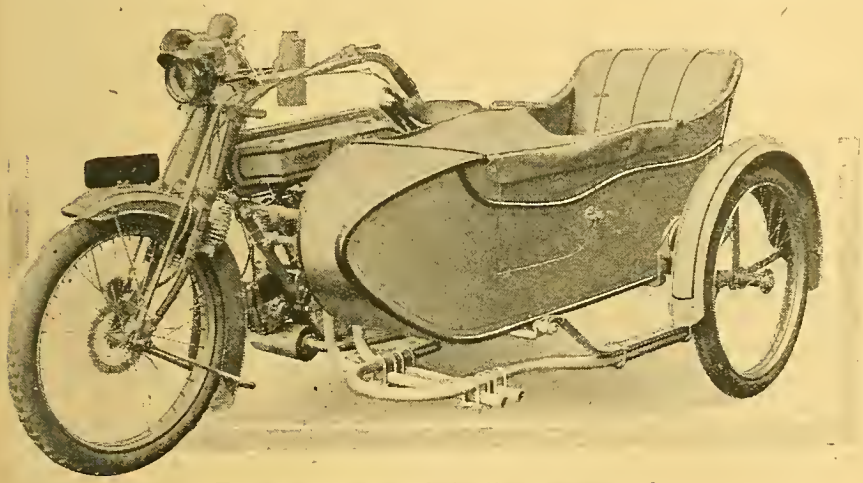
New model 6 h.p. Vindec passenger outfit, showing general design of the bicycle.

Transmission and Fittings.

As regards the transmission, from engine to countershaft the drive is by chain protected by a neat guard, the final drive being by belt. The three-speed gear, kick-starter, and clutch are the well-known Sturmey-Archer, the clutch being controlled by a lever on the handlebars. The gear box is suspended on four bolts, passing through oval holes and sliding in a groove, an arrangement allowing the chain to be adjusted without disturbing the alignment. A comfortable saddle is provided, and Druid forks are fitted. The frame is well designed, and it will be noticed that the top tube is sloped away at the rear, thus giving a low saddle position.

The mudguarding has been well carried out, side wings being fitted to both front and rear guards. All the fittings are good, and such good points as a substantial luggage carrier, an excellent back stand, and efficient front stand are included in the equipment. The tool-bags are metal cased and fixed pannier-fashion each side of the carrier

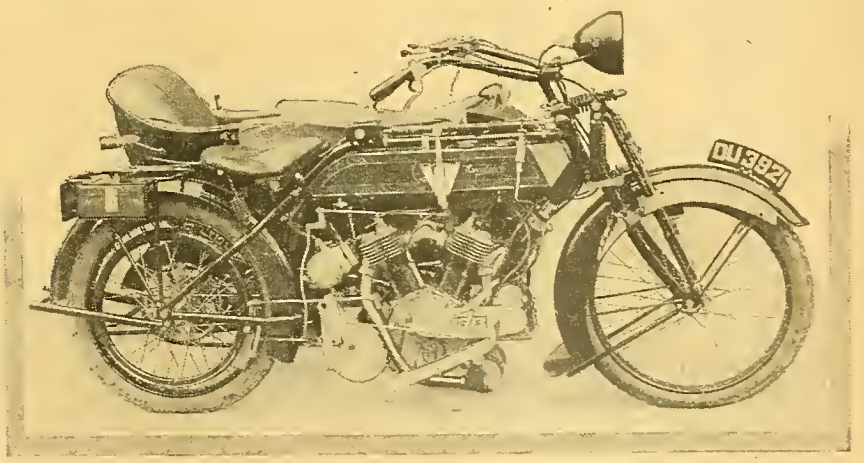
The sidecar is a particularly neat job. It is attached to the bicycle frame at four points, and the main frame is worthy of note. It consists of a single piece of tubing, which is bent downwards at its rearmost ends so as to give a low riding position, and curved round in front. The attachment of the front stays to this portion of the frame will be seen in the illustration. In future models a larger apron than the one shown will be supplied. The whole complete Vindec outfit costs £84, this price not including lamps, horn, and speedometer



The sidecar of the new Vindec 6 h.p. passenger outfit.

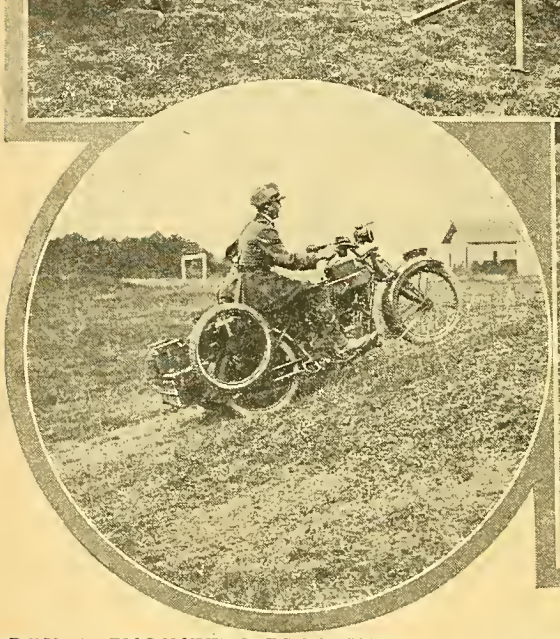
A LIGHTWEIGHT STURMEY-ARCHER GEAR.

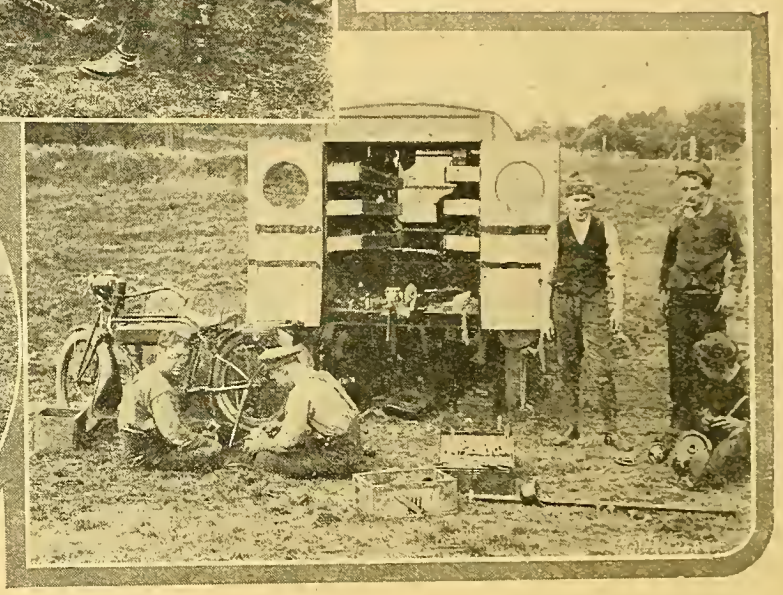
HITHERTO Messrs. Sturmey-Archer Gears, Ltd., have confined their attention to the production of three-speed hub and countershaft gears for the most popular type of motor cycle, but the rapidly extending popularity of the lightweight has led the company to decide upon the production of an entirely new gear of light weight and construction specially for low-powered machines. It will, of course, be fitted in the countershaft. At present practically the whole of the company's resources are engaged on Government work, so that the progress of this new gear may temporarily be retarded. The question as to whether a clutch and kick-starter shall be embodied was discussed with Mr. Harold Bowden, and it seems likely that alternative patterns will be offered.



A fine specimen of a 1916 model 8 h.p. Excelsior passenger outfit, which is fitted with the Lucas dynamo lighting set.

"THE MOTOR CYCLE" RECRUITING SECTION.





MEMBERS OF THE M.M.G.S IN TRAINING

ROYAL ENGINEERS DESPATCH RIDERS.

OWING to the large number of applications which the editor has received daily during the past week, it has been impossible to reply thereto the same day, but the work is being executed as expeditiously as possible. In our issues of October 14th and 21st we published a list of inspecting officers in the United Kingdom, and, to avoid unnecessary work and delay, motor cyclists wishing to join this branch of the service should communicate *direct* with the Inspecting Officer for their district, making an appointment for a riding test, etc.

It is interesting to note that in response to the appeal which appeared in our issue of October 14th, the total number of replies received to date is 276, so it would appear that there is still no lack of recruits.

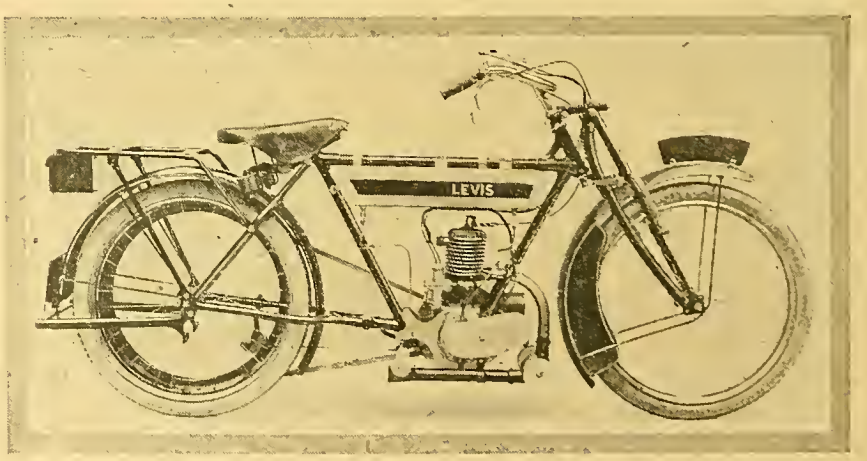
A score of riders were tested for experience in the Coventry Barracks Yard on Saturday, and their names added to the waiting list.

MOTOR MACHINE GUN SERVICE

The following are among the mechanics and car drivers accepted for service last week :

H. Ashton (Doncaster).
J. Baxter (Newcastle-on-Tyne).
E. Doodson (Dewsbury).
F. Gomersall (Dewsbury).
C. Hakeman (London).
G. Howell (Letchworth).
W. H. Meadows (Westerham).
G. R. Smailes (Chilcompton).

Between eighty and ninety names of motor cyclists anxious to join the M.M.G.S. have been sent us whilst recruiting has been closed, and Mr. Geoffrey Smith (Editor, *The Motor Cycle*) has now been instructed to accept about a dozen picked men every week until further notice. Particulars of enlistments in this branch are : Pay 1s. 2½d. per day, usual allowances; foreign service; age 19-38.



A 1916 LEVIS It is a single-geared 2¼ h.p. model with engine of 62×70 mm

"The Motor Cycle" Annual Buyers' Guide

The annual Buyers' Guide of *The Motor Cycle*, which is to appear on Thursday, November 25th, will this year be illustrated. The issue will be greatly enlarged to accommodate the Guide. Manufacturers who may not have received a Buyers' Guide form should apply to the Editor without delay.

An Enterprising Government.

The Russian Government offers some valuable cash prizes to scientists to save the great distilling industry of the Empire. We note some of them below: £7,930, £5,286, £3,172, and £2,114 for inventions and improvements in the use of alcohol for internal combustion motors. Similar amounts for inventions and improvements in the use of alcohol as fuel. The prize winners will retain the ownership of their inventions, which they are allowed to protect by patents and to work if they like.

The A.C.U. and Munition Workers.

What do the A.C.U. think of a munition workers' trial now? When the idea was first mooted in these columns the A.C.U. threw out a feeler, expecting to get promises from all likely to compete. Few offers were forthcoming, which *The Motor Cycle* considered quite natural, and gave the reasons why. The A.C.U. decided not to proceed with the organisation of such an event on account of "insufficient support." Yet a single branch of munition workers organised an event at Brooklands on Saturday and 250 entries were the result.

The National War Funds.

On Tuesday morning last the totals of the principal war funds were:

The Prince of Wales's National Relief Fund ...	£5,578,712
The Queen's Work for Women Fund	156,470
The Times Fund for Sick and Wounded	1,811,221
Belgian Relief Fund	1,040,000
Weekly Dispatch Tobacco Fund	87,050
Daily Telegraph Nurse Cavell Fund	256
Daily Chronicle Christmas Gift Fund	2,845

A Moroccan despatch rider, whose mount is a B.S.A., handing a despatch to a French officer.

More New Models.

We continue this week our descriptive articles of new model motor cycles, most of the machines being illustrated and described for the first time.

The new model 692 c.c. horizontal Brough with side by side valves, the new twin Vindec, and the announcement of a new Sturmey-Archer gear for lightweights will create general interest.

Average Prices.

We give below the average prices of second-hand machines offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model, the average for the past week is quoted, otherwise the latest average.

Among the recent achievements of the 4 h.p. Douglas sidecar machine is that of climbing the Great Orme at Llandudno. The picture shows G. L. Fletcher driving his Douglas on the climb with a passenger in the sidecar.

A Kentish Hill-climbing Trip.

Another trial for Southern munition workers is to be held this coming week-end, this time in the nature of an unofficial jaunt. On the 31st inst., Mr. T. J. Ross, of the Woolwich Club, proposes to conduct a party of riders of two-stroke lightweights around the Kentish hills, meeting at Green Street Green at 11 a.m. Any other motor cyclists engaged on Government work are invited to be at the appointed meeting place and to take part in the tour. Mr. Ross is reputed to know every inch of the Kentish hills, and is sure to provide an interesting trip.

Motor Cycling in Australia.

A writer in our American contemporary, *Motor Cycle Illustrated*, giving his impression of motor cycling in Australia, considers there is a good opening for an American machine on similar lines to the 2¾ h.p. Douglas, but with an engine of at least 500 c.c. He speaks of the wonderful results achieved by the little Douglas in Australia, but he is evidently not aware of the fact that the Douglas build a larger machine, *i.e.*, the 4 h.p. model. There are also three other British-made motor cycles answering to the writer's specification, viz., the A.B.C., the Brough, and the Montgomery.

Saturday's "Aircraft" Meeting.—Some Jottings.

THE JUDGES.—Mr. Mervyn O'Gorman, C.B., superintendent of the Royal Aircraft Factory, was a motor cyclist of the very early days. He was one of the original members of the Auto Cycle Club (now the Auto Cycle Union) committee. As Capt. Bagnall Wild was unable to be present, his post as judge was ably filled by the Rev. Basil Phillips, D.D.

THE TIMEKEEPERS.—These were Messrs. F. T. Bidlake and A. G. Reynolds. Mr. A. V. Ebblewhite was down on the programme, but as not long ago he just escaped a very nasty accident, he was unable to be present.

THE RULES.—The rules were noteworthy for their brevity, simplicity, and commonsense.

THE PLUG RACE.—Marking the competitor's number opposite the plug on the track was a good idea, and better than enclosing the plug in an envelope.

THE PROGRAMME.—The tasteful design on the cover of the programme was done by one of the R.A.F. draughtsmen.

A MISSING STEWARD.—One of the moving lights of the meeting, Mr H. D. Teage, now an instructor on R.A.F. engine and formerly on *The Motor Cycle* staff, was unable to be present, owing to Mrs. Teage's illness. We greatly regretted to hear the reason.

What of the Midland Munition Workers' Trial?

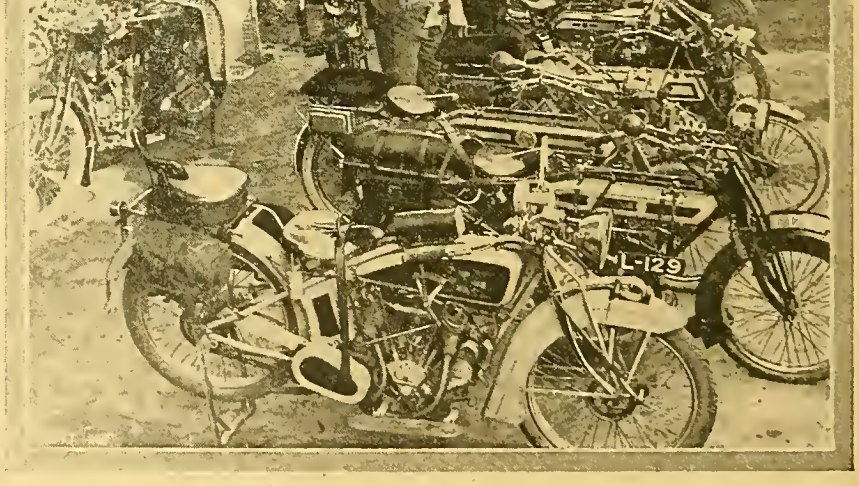
The success of the Southern motor cyclist munition workers' contest at Brooklands should stir the Midland clubs in organising such an event. There seems no doubt about the support such an event would receive, and there are many worthy objects to which the proceeds might be applied. We refer particularly to the provision of winter comforts for our brave comrades on active service.

Great Minds Think Alike.

We were told last week that Mr. Archer, one of the patentees of the Jardine gear, had plotted out on paper a design of spring frame for motor cycles in which a cantilever spring was the principle. The following Thursday *The Motor Cycle* appeared with a description of the Douglas patent springing system—practically identical to Mr. Archer's scheme.

An Indian Opinion of Motor Cycle Progress.

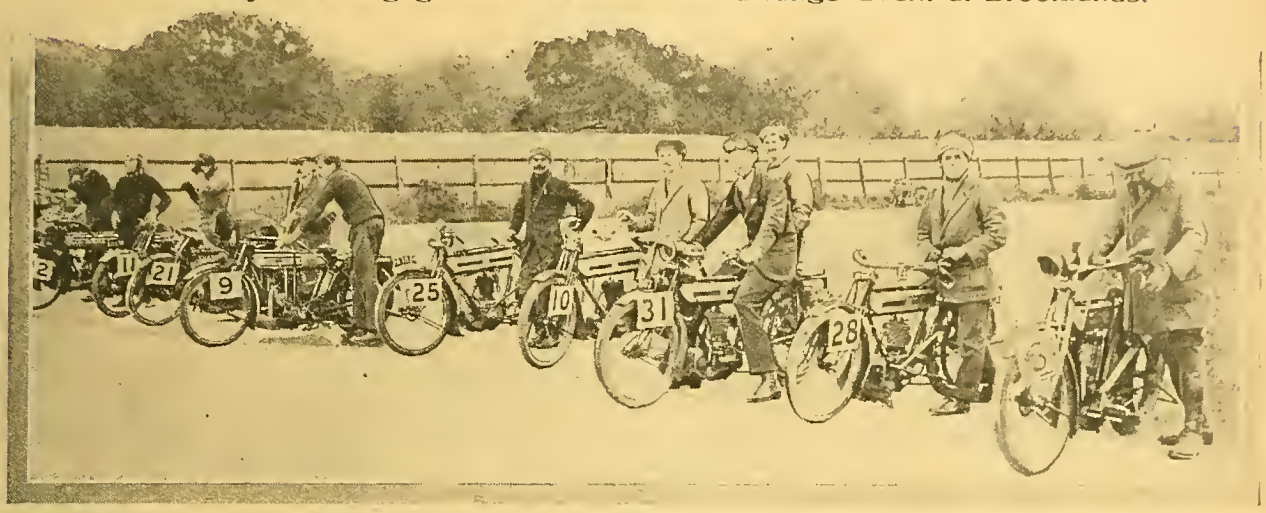
The following extract from *Indian Engineering*, of Calcutta, is interesting as affording an idea of the respective impressions made by early and modern motor cycles in India: "When the motor cycle was first seen on our roads it cannot be said to have been generally welcomed. It was noisy, smelly, uncertain, and a public nuisance, if not a menace. At first also improvements came comparatively slowly, and it was not until the 3½ h.p. engine gave it more power that it was at all a satisfactory machine. Even then there were many difficulties in matters of steering, transmission, and control, which have now been largely overcome. Then came further improvements in ignition, the introduction of the air-cooled and water-cooled engines, the two-stroke type of motor, and the modern machine is no longer despised, and it has done much good work in the war as a means of locomotion for despatch riders. There are several types of motor cycles in use—lightweight machines costing as little as £22 to the heavy four-cylindered machine intended for use with a sidecar, which may cost £100, and which appears to be steadily gaining in popularity."



Examining seats in the Dutch pillion seat trial referred to in the current issue. In spite of the obvious risk of such methods of carrying passengers there appears to be no diminution of the practice, so that a trial to encourage suitable seats appears to be commendable. Dutch, Belgian, American, and British machines will be recognised in the illustration.

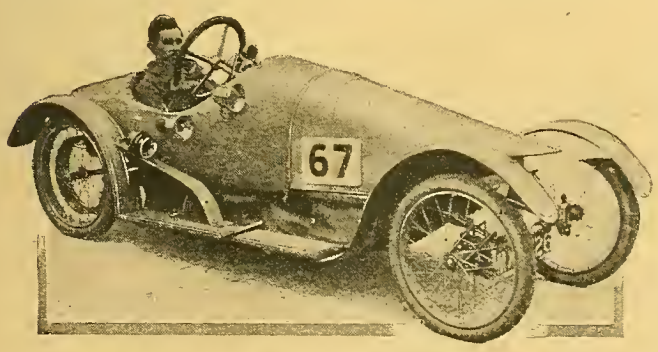
R.A.F. Motor Cycle Race Meeting.

Motor Cyclists engaged on Aircraft Work arrange Event at Brooklands.



Line up for the heavyweight half-mile sprint won by P. Davey (8 h.p. Matchless).

MEMBERS of the staff of the Royal Aircraft factory carried out a most successful motor cycle race meeting at Brooklands on Saturday afternoon last. It was a feat of which the organisers may be justly proud. They only decided to hold the event nine days before the actual date, they were one and all absolutely inexperienced in the conduct of such an affair, yet there were eighty-three competitors—245 motor cycle and twenty car entries, making 265 in all—and though one can hardly say it was excellently organised, it passed off well, and gave an untold amount of amusement and enjoyment to those who took part in it. There was only one name well-known to motor cyclists, and that was W. F. Guiver; but among the officials we noticed the names of Mr. Mervyn O'Gorman, C.B., S.R.A.F., Dr. A. M. Low, D.Sc., A.C.G.I., Sec.-Lieut. R.F.C., Capt. Bagnall-Wild, R.I.E., and Messrs. H. D. Teage and E. M. P. Boilean (*The Motor Cycle*). It was to Mr. J. S. Irving, the clerk of the course and hon. secretary, and to his able committee that the greatest credit was due. It is a pity that the meeting had been arranged in such a hurry, as otherwise it might have been given due publicity, and a large "gate" would have been obtained. However, as it was, the R.A.F. provided not only an excellent entry list but a very fair crowd of spectators. All showed the greatest enthusiasm, which goes to prove how well legitimate motor cycle events can be supported even during the present crisis.



A STRIKING BELT-DRIVEN CYCLE CAR.

A. J. H. Elverson (8 h.p. Crompton), winner of the half-mile sprint race for cars at the R.A.F. Brooklands meeting. The lines of the machine are very attractive, the body being tapered to a point fore and aft. The engine is a twin-cylinder of 964 c.c., and final drive is by belt.

It is really remarkable that one department should produce so many motor cycles and such an excellent entry.

The Track Improved.

As regards the machines, these were a splendid selection, including all types and sizes, most of which were in capital tune and well ridden. There was, however, a lack of novelty and of special features among them, but it is hardly to be expected that this would be otherwise during the present time. Since the United Services race meeting in September the track has been greatly improved, and the road leading thereto is practically finished, but still only half-mile sprint races could be run off down the finishing straight.

The newly made roadway to the flying grounds runs through the paddock, but the paddock itself is not yet fully repaired. It is hoped that the track will be in excellent order in the spring; in fact, better than when it was first laid down. The sprint races were started from the top of the finishing straight, and the handicaps were arranged on distance instead of time, spaces of 40, 80, 120, and 160 yards being measured off from the starting line.

Details of the Events.

EVENT No. 1.—LIGHTWEIGHT HALF-MILE SPRINT FOR MOTOR CYCLES fitted with engines not exceeding 300 c.c. capacity. Result:

	Rider and Machine.	Bore and Stroke.	Cyls.	c.c.	Yds. Start.
1.	N. A. Champion (2¾ Sun-Vitesse)	70×70	1	269.5	40
2.	C. Doczy (2¾ Sun-Vitesse)	70×70	1	269.5	40
3.	— Cook (2¾ Sparkbrook)	70×70	1	269.5	40
	— Payze (2¾ Levis)	64×70	1	215.3	120
	A. H. Bates (2½ Levis)	73×70	1	293	Scr.

N. A. Champion won easily at a speed of 37.1 m.p.h. Time: 1843s.

EVENT No. 2.—HEAVY-WEIGHT HALF-MILE SPRINT FOR SIDECARS (1,000 c.c. limit) AND CYCLE CARS (1,100 c.c. limit). Adult passengers had to be carried (minimum weight 110 lb.)

The event was well supported, and the winner came in an easy first, having covered the distance at a speed of 43.8 m.p.h. Result:

	Rider and Machine.	Bore and Stroke.	Cyls.	c.c.	Yds. start.
1.	F. G. Kennard (5-6 Matchless)	85 ×65	2	737	40
2.	C. Horsfield (6 Humber)	78 ×78	2	745.6	40
3.	A. J. Elverson (8 Crompton c.c.)	85 ×85	2	964.5	80
	A. Andrews (5-6 Enfield)	76 ×85	2	771.2	40
	H. E. Wonham (7-9 Indian)	82.5×93	2	994	scr.
	A. J. Sharp (5-6 Zenith)	76 ×85	2	771.2	40
	J. Aust (5 F.N.)	52.5×57	4	496	160
	G. Haydon (8 Imperial c.c.)	85 ×85	2	964.5	scr.

Time: 41s.

The excellent running of the horizontal twin Humber was worthy of note. The engine on this machine was fitted with a large leather covering extending right over the carburetter, as this, though already warmed by the exhaust, had to be further protected so as to maintain the correct temperature.

EVENT No. 3.—MEDIUM-WEIGHT HALF-MILE SPRINT FOR TOURING MOTOR CYCLES fitted with engines up to 550 c.c.

This event was so well supported that it had to be run off in two heats, of which the following are the results:

HEAT 1.—G. T. Taylor (Douglas), time 39⅘s. M. E. Holroyd (Rudge), W. P. Savage (Rudge), W. J. Bird (Triumph), and F. Sawyer (Douglas).

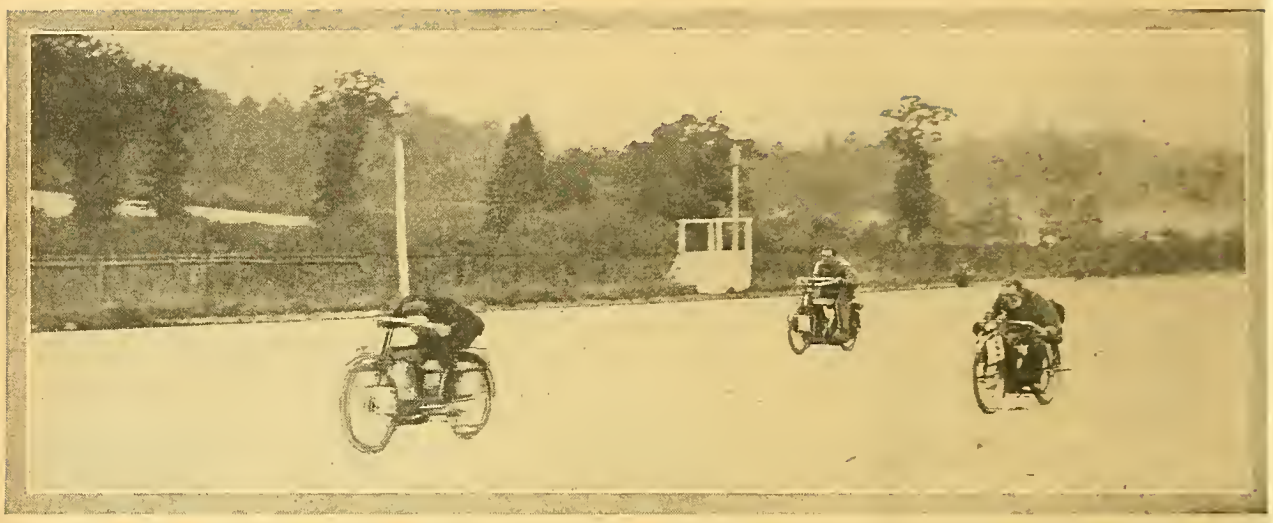
o 550 c.c.
ews.



The final yards of one of the races at the "R.A.F." Brooklands meeting on Saturday. This was the first organised competition held for men on Government work.

Heat 2.—S. O. Turner (Douglas), time 3.1⅜s.; E. G. Perrott (Douglas), E. Swain (Rudge), — Cotterell (Douglas), and W. F. Guiver (Ariel).

The winner of the first heat could not be found when the final was run off, and it was then decided that this should be run again. In the final, however, Taylor was so excited that he covered the whole course on second speed, and forgot to change up, and so only finished sixth.

A Wonderful Flying Display.

It was during this event that the most exciting incident of the meeting took place. Lieut. Goodden, R.F.C., chief experimenter to the R.A.F., flew over from Farnborough in one of the very latest Army airplanes. Never since the time when poor Pegoud came down to the track and looped the loop has Brooklands witnessed such marvellous flying. His control of his machine was wonderful, and his turns, twists, and gambols in the air momentarily took all interest from the meeting. Then while the competitors were waiting to be sent off on the first final, he swept down the track at a tremendous speed, just clearing the string of flags that marked the finish. We kept our eyes upon the wires which run across the finishing straight. Goodden seemed to clear them, but when he had passed they lay in a tangled mess on the ground, and the Paddock clock stopped at 2.2n p.m. This is apparently all the damage done, the poor timepiece, which is worked electrically, being thus deprived of its source of energy. Goodden then swept sharply up, banked at a seemingly impossible angle, swept down the straight again, just skimming the track, and hurtling towards the anxiously awaiting competitors at the start. At the last moment he raised his elevator and shot up into the air. He terminated his exhibition with a brief spell of "hands off" flying.

Final of Event 3. Result:

Rider and Machine.	Bore and Stroke.	Cyls.	c.c.	Yds. start.
1. S. O. Turner (2¾ Douglas)	60 ×60.5	2	347	120
2. E. G. Perrott (2¾ Douglas)	60.5×60.5	2	349	120
3. — Cotterell (2¾ Douglas)	60.5×60.5	2	349	120
M. E. Holroyd (3½ Rudge Multi)	85 ×88	1	499	40
E. Swain (3½ Rudge)	85 ×88	1	499	40
G. T. Taylor (2¾ Douglas)	60.5×60.5	2	349	120

The winner's speed was 51.1 m.p.h. Time: 35⅛s.

Event 4.—Heavy-weight Half-mile Sprint for Touring Motor Cycles of any description.

As in the preceding event, the number of entries necessitated it being run off in two heats, and P. Davey won the final at a speed of 56.12 m.p.h.

Heat 1.—F. G. Kennard (Bradbury), time 36s.; E. G. Perrott (Douglas), C. Horsfield (Humber), H. E. Wonham (Indian), and N. Legge (Matchless).

Heat 2.—P. Davey (Matchless), time 33⅜s.; S. O. Turner (Douglas) F. Edney (Matchless), W. F. Guiver (Ariel), and T. P. Mears (Ivy).

The final result was as follows:

Rider and Machine.	Bore and Stroke.	Cyls.	c.c.	Yds. Start.
1. P. Davey (8 Matchless)	85 ×85	2	964.5	Scr.
2. C. Horsfield (6 Humber)	78 ×78	2	745.6	40
3. E. G. Perrott (2¾Douglas)	60.5×60.5	2	349	120
F. G. Kennard (3½ Bradbury)	89 ×89	1	553.8	80

The winner's speed was 56.12 m.p.h. Time: 32s.

The only car race to be run off during the meeting was

Event No. 5.—Motor Cars Half-mile Sprint for Touring Cars of unlimited capacity. This was won by A. J. H. Elverson (8 Crompton cycle car) in 43⅜s., 41.5 m.p.h.

The sprint races were now concluded, and there ensued a series of hill-climbs the results of which were worked out on *The Motor Cycle* formula.

Event No. 6.—The Lightweight Motor Cycle Hill-climb for Touring Motor Cycles up to 300 c.c. Result:

Rider and Machine.	Bore and Stroke.	Cyls.	c.c.	Fig. of Merit.
1. C. Doczy (2½ Sun-Vitesse)	70×70	1	269.5	317.9
2. N. A. Champion (2½ Sun-Vitesse)	70×70	1	269.5	325.4

There was one failure. C. Doczy also made fastest time, 17s.

Event No. 7.—Medium-weight Hill-climb for Touring Motor Cycles fitted with engines up to 550 c.c.

In this event there were three failures. Hounsome (Triumph) caused some amusement by stopping halfway up the test hill and dropping his machine. Swain (Rudge) got up quite well, which was a wonder, as his petrol pipe was coupled up by means of a piece of rubber tubing, from which the two and a penny a gallon fluid was simply streaming. Turner (Douglas) managed to stop just before reaching the summit. Taylor (Douglas) had his machine catch fire just before starting, but it was quickly extinguished by the caps of numerous brave volunteers. Excellent starts by means of the clutch were made by Guiver (Ariel) and Manning (A.J.S.) Result:

Rider and Machine.	B. and S.	Cyls.	c.c.	Time.	Fig. of Merit.
1. W. F. Guiver (3½ Ariel)	86.4×85	1	499	8⅜s.	77.28
2. R. J. Hampton (3½ Matchless)	70 ×64.5	2	496.4	8½s.	99.17
3. E. G. Perrott (2¾ Douglas)	60.5×60.5	2	349	9⅜s.	99.8

The fastest time was made by R. J. Hampton.

Event No. 8.—Heavy-weight Hill-climb for Touring Motor Cycles of unlimited capacity. Result:

Rider and Machine.	B. and S.	Cyls.	c.c.	Time.	Fig. of Merit.
1. E. V. Perrott (2¾ Douglas)	60.5×60.5	2	349	8s.	83.79
2. W. F. Guiver (3½ Ariel)	86.4×85	1	499	9s.	84.80
3. P. Davey (8 Matchless)	85 ×85	2	964.5	5⅛s.	96.21

Guiver's Ariel (on which he won both on time and formula) was a handsome chain-cum-belt drive countershaft model with the change speed lever at the side of the tank.

Event No. 9.—Heavy-weight Hill-climb for Sidecars and Cycle Cars (up to 1,100 c.c.) carrying adult passenger (minimum weight 140 lb.)

Rider and Machine.	B. and S.	Cyls.	c.c.	Time.	Fig. of Merit.
1. C. Horsfield (6 Humber)	78 × 78	2	745.6	7⅜s.	117.3
2. A. J. Elverson (8 Crompton c.c.)	85 × 85	2	964.5	12⅛s.	163.7
3. A. Andrew (5-6 Enfield)	76 × 85	2	771.2	13⅝s.	190.8

The winner on formula also made fastest time.

Gymkhana Events.

Event No. 10.—Quick Change Plug Race for Touring Motor Cycles of unlimited capacity.

In this event, spare plugs were placed opposite the competitor's number, which was chalked on the track opposite the grandstand. The men started from the finishing line, changed a plug, proceeded about 200 yards, changed the plug again, and sprinted to the finish. The first three men to get away after the first stop finished first, second, and third. Result:

Rider and Machine.	Bore and Stroke.	Cyls.	c.c.
1. E. G. Perrott (2¾ Douglas)	60.5×60.5	2	349
2. P. Davey (8 Matchless)	85 ×85	2	964.5
3. F. Edney (5 Matchless)	85 ×65	2	737.7

Event No. 11.—Serpentine Race. The competitors were started some 200 yds. away from the grandstand, raced to a series of barriers round which they had to ride serpentine fashion, and then sprint to the finish. The percentage of successes was about equal to that of the failures, thus showing that the barriers were placed the right distance apart.

Rider and Machine.	Bore and Stroke.	Cyls.	c.c.	Time. secs.
1. M. E. Holroyd (3½ Rudge Multi)	85 ×88	1	499	40⅜
2. V. Walker (2¾ Douglas)	60.5×60	2	347	41⅛
3. F. Edney (5 Matchless)	85 ×65	2	737.7	44⅜
W. P. Savage (3½ Rudge)	85 ×88	1	499	45
T. P. Mears (4¾ Ivy)	67 ×95	2	669.8	47⅜

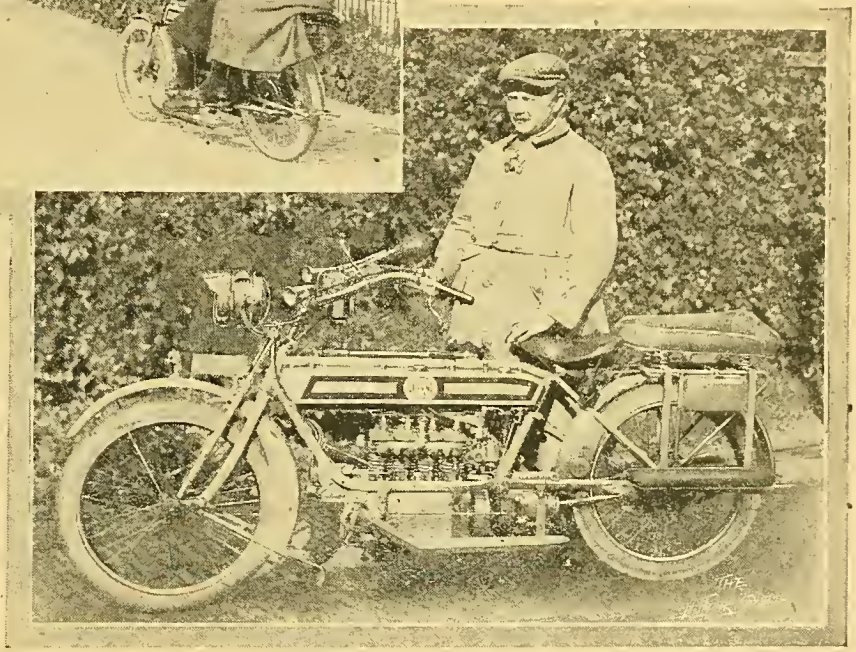
This concluded the meeting, as the weather, which had been dull and cold throughout the afternoon, broke up altogether, and it began to rain, while the light was failing badly. One car event was, therefore, not contested.

A TRIAL OF PILLION SEATS.

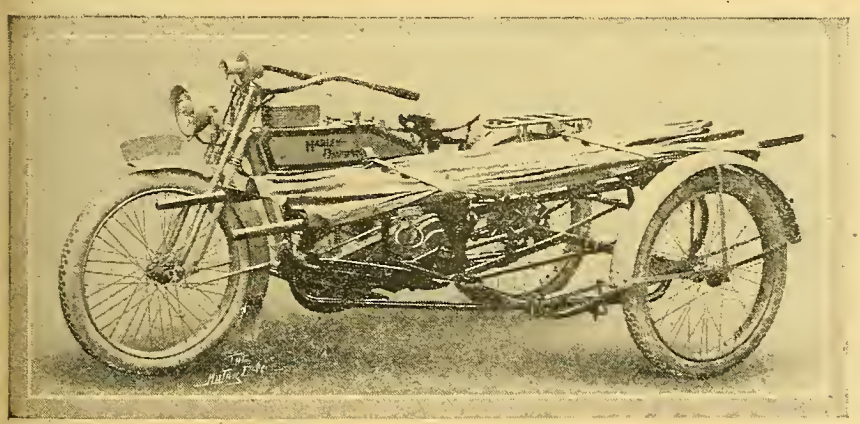
CARRIER or pillion riding has always been looked upon as a very dangerous method of carrying an extra passenger on a motor cycle. In order to try and prove that this is not so, and also to find out the best type of pillion seat, a Dutch motor cycle club organised a reliability trial for this type of machine, most of the passengers being ladies. The trial was organised at so short a notice that it had been expected that some of the fitments would not stand up to the test, but much ingenuity was displayed in the construction of the seats, and all proved practical.

The course was seventy miles in length, and had to be covered at a scheduled speed of just under 20 m.p.h. There were nine competitors, whose machines had various types of pillion seats, and the first prize was awarded to the F.N. ridden by M. P. B. L. Maas. The pillion consisted of an upholstered seat with low back and side, supported on four spiral springs attached to a flat metal frame which was clipped to the cycle carrier by four clips, and carried the platform for the passenger's feet.

The second place was gained by Mr. Wyngaarder, whose pillion consisted of a round cushion with back rest, while a sprung footboard was provided for the passenger's feet. Provision for the passenger's feet was made in most of the designs, and was a point where they scored over those usually used in England. In addition to some of the machines being English, some of the seats were also of British origin.



(Upper) A competitor in the Dutch pillion seat trial. The passenger appears most comfortable.
(Lower) The winning pillion seat. The machine is a four-cylinder F.N.



Harley-Davidson sidecar ambulance, many of which have been supplied to the Russian Government.

THE HARLEY-DAVIDSON AMBULANCE.

MORE attention, it would appear, is now being paid to the motor cycle ambulance, and we illustrate the Harley-Davidson sidecar ambulance, which is an extremely neat piece of design. It will be noticed that a special bracket has been fitted to the existing sidecar chassis for the purpose of carrying the stretcher, which is held in position by means of four bolts and wing nuts, rendering it easily detachable. The strength of the sidecar frame and its excellent design render it suitable for this sort of work. It is interesting to note that the bracket which carries the stretcher is sprung in the same efficient manner as the ordinary sidecar body, namely, on two Cee springs. Many of these ambulances have been supplied to the Russian Government.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle" Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Engine Rattle in Two-strokes.

Sir,—Like your correspondent Mr. Kontweit I have owned one of the 1915 Levis popular models and experienced the identical troubles he refers to, excepting that, in my case, the cause of the machine not firing nor giving a splutter was short circuiting in the magneto, which is American, and the same make has played the same trick on a friend's machine. Otherwise, but for belt slip, you could not have a nicer machine nor one easier to handle.

J. L. BARLOW.

Sir,—I notice with interest that this question is again occupying the columns of your valuable paper.

At the present time I am the possessor of a single-speed two-stroke, which persistently rattles at a speed of over 20 m.p.h. When new it would do 25-30 m.p.h. with hardly any effort, but after 1,500 miles it developed a peculiar sound, as if the engine were working with difficulty.

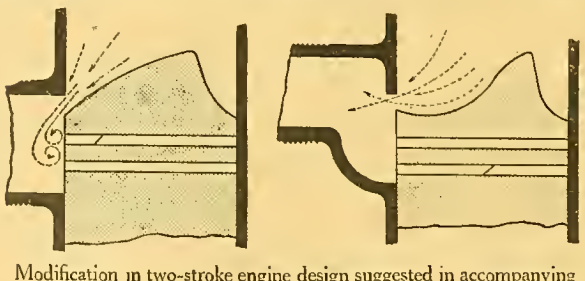
The motor has done about 5,000 miles to date, and I have already taken the engine down several times, but with no better result. One thing I notice, however, is that after the engine has been cleaned the rattle disappears for about 100 miles.

I have fitted new piston rings and magneto chain, but these effected no cure. I am certain the piston is the cause of the noise, because when I lift the compression lever there is immediately a loud hammering sound.

Personally, I have given up trying to cure this trouble, as I think once an engine has developed it there is no remedy.

SCUD.

Sir,—Mr. A. C. Byrne's letter (issue October 14th), giving his experience of two-stroke engines, has suggested to me a possible cause and its remedy. I do not wish to dogmatise, but sometimes a slight change in design may remove a great trouble. Mr. Byrne says the trouble comes with change in road speed, otherwise power exerted in relation to change of pressure in cylinder or velocity of the exhaust through the port. He also says the top piston ring is stuck and carbonised on the exhaust side.



Modification in two-stroke engine design suggested in accompanying letter from Mr. W. F. J. Simpson.

This suggests to me that perhaps when the exhaust begins to open an eddy may beat against the side of the piston and piston ring, carbonising the oil around the piston ring, and causing a hot dry patch on the piston, which may cause uneven friction resistance to the lifting piston.

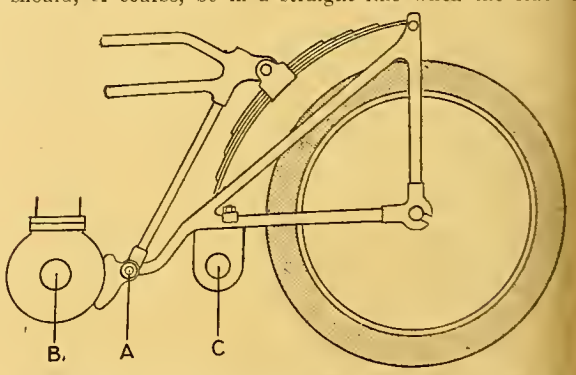
I suggest a remedy which might possibly be worth trying. Bring the exhaust pipe higher up on the cylinder so that the top edge of the port comes in the middle of it, and shape the top of the piston so that it is concave instead of convex. This arrangement would also have the tendency of causing the exhaust to part with some of its remaining energy by transferring some of its velocity to the piston, and though it might not be of much potential value it would assist to cause an easier flow through the port and cause less noise.

WILLIAM F. J. SIMPSON.

Cantilever Rear Springing.

Sir,—I am sending you a sketch, thinking it may be of interest to others, of a design for a rear sprung frame, which, I believe, differs from any previously shown in your paper. It makes use of the cantilever principle, which is now coming into favour with cars.

The chief advantages that I claim for it are that the working joints, of which there are four, are well away from mud splashes, and that it would be comparatively easy to adapt it to any of the usual types of single-cylinder or V twin machines as now made. By placing the gear box on that portion of the frame which acts as a radius rod, the hinge joint A is relieved of belt or final chain strain. With a tight belt this strain is considerable. The points A, B, and C should, of course, be in a straight line when the rider is



Cantilever suspension applied to a motor cycle frame. See letter from Corporal Hudson on this page.

in the saddle. A might very well be a ball bearing, as in the Triumph front fork, so as to be easily adjustable. The two ends of the spring might have either sliding joints or shackles, the former being probably cheaper and occupying less room.

One slight disadvantage of the design is that it would probably necessitate a slightly higher saddle position than the usual. The carrier and anything on it is, of course, unsprung weight, and that is a good reason for putting tool bags elsewhere. I have seen them slung on either side of the tank, just forward of the rider's knees, with complete success.

(CORPL.) J. C. HUDSON.

B.E.F.

THE MOTOR CYCLE

BUYERS' GUIDE OF 1916 MODELS.

THURSDAY, NOVEMBER 25th!

This issue will be considerably enlarged and will contain an illustrated review of the various new pattern motor cycles.

The Tight Spot in a Chain.

Sir,—"Ixion's" correspondent is quite correct about tight spots in chains on new machines. The countershaft and other sprockets are always turned and milled for the teeth before they are fixed to their respective shafts. It depends on the construction whether the sprocket is slightly out of truth after mounting on the shaft or not. If the sprocket is machined while on a mandrel, and the hole in the sprocket is accurately bored before mounting, the hole being the same diameter as the shaft on which the sprocket is to fit, then it cannot very well run out of truth vertically. If it has a small hole in the boss, and is made to key direct to the shaft, the keying process may easily throw it out of truth if at all weak. One of the best methods of mounting the sprockets is to key or cotter a boss on the shaft, true each boss on its own shaft, and provide the boss with a flange, to which the sprocket is riveted by pressing the heads of the rivets in a powerful press. The large hole in the sprocket is made dead true with the flange on the boss, and the sprocket is machined on a large mandrel.

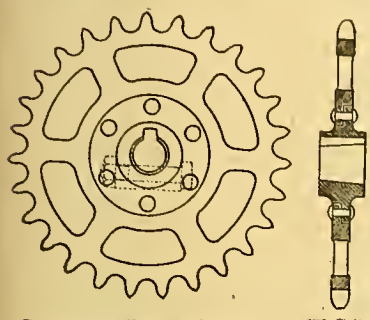


Diagram to illustrate letter from "W.G." on the tight spot in chains

Again, difficulty crops up when the large driven sprocket is between clutch plates. The boss on the shaft in this case must also be quite true, and the ball or other type of bearing, on which the sprocket is free to revolve when the clutch is out, must be true. There is more difficulty in getting a true running driven sprocket in this latter case than when it is rigidly attached to the countershaft, as in the case of the driving sprocket to rear wheel. W.G.

The Army and Navy Hill-climb.

Sir,—I notice you refer to my action in competing at the Army and Navy Hill-climb when I was also acting as chief marshal as being "incompatible with the A.C.U. rules."

If you will look at No. 52 of the open competition rules, you will see that the only officials prohibited from competing at an open meeting are the following, namely, the judges, the measurer, the timekeepers, and the handicappers.

Not only is no embargo laid on the remaining officials, but the appointment of temporary officials, who may be competitors, is expressly provided for in the last paragraph of the above rule.

I trust therefore that, in justice to me, you will publish this letter. F. L. BASSETT (SEC-LIEUT.),
Chairman Streatham M.C.C.

[Mr. Bassett claimed that he was Clerk of the Course as well as Chief Marshal. We abstract the following from the A.C.U. open competition rules under "officials":

Recognised Officials.—52. The following are the recognised officials of a meeting, and their appointments shall be subject to the approval of the Union, viz., three or more stewards of the meeting, and such numbers of the following as may be required.

A clerk of the course, judges, a starter, a clerk of the scales, a measurer, a chief marshal, timekeepers, handicappers, marshals, and observers. Of these the judges, the measurer, the timekeepers, and the handicappers must each, as a qualification for his office, hold the formal authorisation of the Union, *and none of such officials appointed for any open meeting shall be eligible to compete in any competition at such meeting.*

The italics are ours.—ED.]

Foot-operated Exhaust Valve.

Sir,—In reference to "Occasional Comments" by "Ixion," I would like to mention that my machine happens to be a F.N., clutch model (handle-bar controlled). In this instance the operation of the clutch is as easy as that of the exhaust valve lifter; also it *does* operate in a jiffy, and requires *no* muscular effort.

Also it would be rather interesting to know how "Ixion" intends to start the four-cylinder Henderson, which he admits to being of "unpromising length and weight," fitted with a pedal exhaust valve lifter such as he advocates. Does he intend to run it along against compression? Or perhaps we shall see him hopping along with one leg, the other being engaged in depressing the exhaust valve lifter pedal. F.N. SHAFT DRIVE.

Tubing for Acetylene Gas.

Sir,—In your paper of October 7th I notice that on page 340 your contributor states "that it has been advocated in the motor cycle press that copper tubing is the best thing to carry gas from the head light generator to the rear light.

I am under the impression that copper and acetylene gas are best kept apart, as I understand that between them they manage to form a very explosive compound, which is liable to explode at any moment. I believe that several home-made generators which have caused serious consequences have been made of copper, and that the explosion has been traced to the action of the gas on copper. If you could ascertain this fact (no doubt some of the makers of generators could enlighten you on the matter), then, if I am correct, it would be in the interests of your readers to publish it, and save them from committing this error.

I notice that your correspondent has used Bowden tubing with satisfactory results. This I am pleased to know, as my experience of the ordinary rubber tubing (both bare and armoured) has been most unfortunate. The rubber either cracks and lets you down at an awkward moment, or else the armoured gets choked up owing to the small bore.

I have used with success for the past two years a length of ordinary ⅜in. flexible gas tubing in conjunction with the rubber nozzles used for connecting to gas rings, etc.
A. B. COUSINS.

[We believe our correspondent is quite correct respecting the use of copper with acetylene gas, but brass is perfectly safe; we have not tried Bowden casing.—ED.]

CUMBERLAND LADY MOTOR CYCLISTS.

Mrs. W. T. Smith, of Workington, and her sister Miss Crane, of Cockermouth, who have both covered over 3,000 miles this year on their Royal Ruby two-stroke lightweight motor cycles

Infant Phenomena.

Sir,—May I have the privilege of using your valuable columns to make a suggestion? Some people seem to be in doubt as to the capabilities of boy motor cyclists. Could some club not arrange some item in a hill-climb or some other test be kept for boys under a certain age? The reason that boys do not appear more in club events is, I think, that it is hardly worth while for a schoolboy to join any club, as he is at school most of the year.

W.G.H.B.

The Modern Sidecar Outfit Compared.

Sir,—In reading your paper I saw E. C. Palmer's letter referring to the efficiency of three-year-old sidecar mounts, and I should like to say that I, too, have undergone similar experiences. I have a 1913 3½ h.p. Triumph, and I use a James canoelet sidecar with it. Last summer I went up the "struggle" outside Ambleside over the Kirkstone Pass and down to Ullswater. I returned up Kirkstone Pass and back to Windermere again, and not once during the run did the passenger (who weighed eleven stone) or myself have to dismount. I carried a full travelling equipment, including luggage and a full petrol tin. On going up the "struggle" I passed a lady who had evidently dismounted from a sidecar, and a little further I passed a 6 h.p. twin and heavy sidecar which had failed to mount the hill. This, I think, speaks well for the old mounts, although before going up I pulled the exhaust out of the silencer. The hill mentioned is, as you know, a good two miles long, and is considered the stiffest main road hill in the Lake District, I am told.

I only add I have no connection with the Triumph firm. I can run the machine at any speed from 5 m.p.h. to 45 or 50 m.p.h.

F.H.A.

Sir,—In *The Motor Cycle* of the 14th inst. a correspondent rather depreciates the modern three-speed gear sidecar outfit. As a happy possessor of a 6 h.p. 1915 A.J.S. sidecar combination, I should like to state the following facts, having no interest in the firm of Messrs. Stevens other than that of a highly satisfied customer.

This summer my wife and I had a ten days' tour in the Highlands, on nine of which it rained. On our way to Grantown-on-Spey from Edinburgh we encountered the worst weather over the Grampians—that is from Struan to Dalnaspidal—a very stiff climb even in good weather. We went the whole way up on top at a good bit over 20 m.p.h., notwithstanding luggage for two, and hood, screen, and side curtains up. The only occasion I have had to use bottom gear (except, of course, when starting) was on the test hill between Grantown and Tomintoul at the Bridge of Brown, where one is faced with a climb of 1 in 8 after a right-angle turn on a bridge. The machine has done about 4,000 miles and has never given any trouble. The petrol consumption is most satisfactory. With hood and screen up, 60 m.p.g.; with both down and good weather conditions, 76 m.p.g.

M. G. GREIG.

6 h.p. 1915 A.J.S. passenger outfit referred to in letter from Mr. M. G. Greig on this page.

Sir,—In *The Motor Cycle* of the 14th inst. I read with astonishment the letter on "The Modern Sidecar Outfit Compared." Your correspondent must be of a very observant order from his remarks *re* procession of modern motor cycles which failed to climb various hills with sidecar and passenger. In the first place, he apparently fails to understand that usually a wicker sidecar is only just about half the weight of a coachbuilt sidecar. Secondly, sensible people who travel with a motor cycle and sidecar for pleasure are not in the least concerned whether your correspondent cares to show off the racing powers of his machine or not. Thirdly, he does not appear to appreciate the fact that many people with a new mount often desire to carry out experiments, and find out the capabilities of the machine under varying conditions on the first convenient hill.

I believe it is generally understood that very few people properly understand a new make of machine until its peculiarities are mastered.

Bury Hill in Sussex, with a gradient averaging 1 in 11, is specially mentioned. I am not an expert, but I guarantee I will take any modern machine of 4 or 4¼ h.p. of reputable make with a three-speed gear up this or any other similar hill with a loaded coachbuilt sidecar at any time.

I am the owner of a 1915 4¼ h.p. chain-driven B.S.A., and use a coachbuilt sidecar weighing 125 lb. I can take this over almost any hill in Kent on second gear with sidecar and passenger with ease. Plenty of these hills, as is well known, average about 1 in 7 to 1 in 9 and even less, and are of considerable length, such as Boxley, Steed Hill, Star Hill, Trossley Hill, Chevening Hill, and many others. Those mentioned, with others, were specially surveyed for gradient, and used for War Office trials. I have ridden several modern outfits of the power mentioned or thereabouts, and have, so far, absolutely failed to find such a disreputable mount as any which your correspondent describes. It would give me very great pleasure to have a trial run with him as to speed or hill-climbing capabilities under the same conditions, or rather I take the modern heavy mount with sidecar and passenger, and he take his 1912 light mount with wicker sidecar and passenger.

E. J. DAVIES.

Belts.

Sir,—There is one improvement for the perfection, or rather towards the perfection, of motor bicycles which seems to have entirely escaped the notice of motor cycle manufacturers, and that is the construction of driving belts of a commonsense design. During several years experience of motor cycling I have noticed that the only place where a belt gives is at the fastener. The remedy is obvious. Why not make the belt one and a half times the ordinary depth for, say, three inches from each end, the extra depth coming on top, *i.e.*, on the outer or broader edge of the belt?

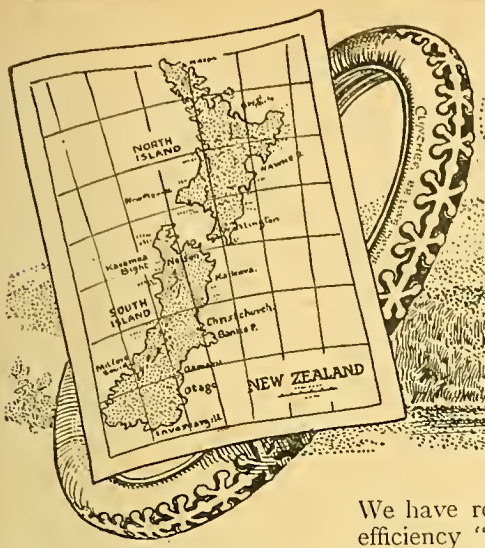
EDWARD T. WARREN, Indian Police.
United Provinces, India.

Scott Lubrication.

Sir,—With reference to "T.E.D.'s" letter in the issue of October 7th, I do not think the mixing of the petrol and oil in the Scott machine will make any difference, as the result must be the same as if the oil is fed direct to the crank case.

I have not ridden a Scott for some time, but when I had one the hand pump was fitted. On several occasions I carefully pumped oil into the crank cases to the correct level, when the engine was hot, and removed the covers to see that the level was correct. After five miles running I used to dismount (this was the distance recommended by the makers as the interval between charges), and after waiting for the oil to drain I would again verify the level. Invariably, the oil had almost all disappeared, obviously through the exhaust, therefore I can see no difference between crank case lubrication and mixing the oil with the petrol. I should, however, recommend "T.E.D." to keep a little oil in the crank case to lubricate the big end bearings, but not enough to make a splash, as the pistons will be sufficiently lubricated by the other method.

SCOT.



A NEW ZEALAND SUCCESS

We have received some gratifying results of Clinchers efficiency "down under" which go to prove that for hard wear and service there are no motor cycle tyres to approach them.

The New Zealand motor cyclist photographed below mounted on a

"L.M.C." Motor Cycle

pulled off the following in quick succession:—

Jan. 20.—Southern Hawkes' Bay Motor Cycle Club:—
Swing Bridge Hill—Fastest Time, 1st on Formula.

Feb. 9.— " " " " " " " "
" 15.— " " " " " " " "
" 17.— " " " " " " " "
Reliability Run to Webber and back to Dennevirke, 1st, gaining 96 points.

Mar. 1.—Swing Bridge Hill. Fastest Time—2nd on Formula.
" 8.—Adelaide Road Hill. " " (A RECORD).
" 15.—Swing Bridge Hill. " "
" 19.—Adelaide Road Hill. 2nd Fastest time on Formula.

April 5.— " " " Fastest Time.
At St. Patricks, Day Sports, Dennevirke, 1st in Thread and Needle Race, half mile.

His machine was fitted with

CAMPION MOTOR WORKS, NOTTINGHAM

To enjoy motor cycling *thoroughly* you must understand your machine *thoroughly*

Get the **16th Edition** (Revised) *of this useful book*

"MOTOR CYCLES & HOW TO MANAGE THEM" —the standard handbook for motor cyclists—will tell you practically all you want to know about your machine.

¶ There is no doubt as to the supremacy of this book over all others of a similar kind. It is constantly being checked and revised by the staff of "The Motor Cycle," and coosequeutly carries the weight and authority of this journal.

¶ Its contents embrace a multitude of subjects relating to motor cycles, their care and management. It is clearly written and well illustrated. Every motor cyclist—whether beginner or experienced rider—should keep a copy handy for reference.

Price 1/- Net

By Post 1/3

Obtainable from ILIFFE & SONS Ltd., 20, Tudor St., London, E.C., and all booksellers and bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Testing Oil.

(1.) I have had a quantity of engine oil given to me. How can I test its suitability for an air-cooled motor, and what will happen if used and not suitable? (2.) When is an air-cooled engine considered too hot to run with safety, and how can I prevent overheating when climbing long hills on a low gear? (3.) Will a windscreen and hood on a sidecar attached to a 3½ h.p. three-speed machine be too much for the engine?—C.S

(1.) The testing of engine oil is not within the capabilities of the amateur, unless he is an expert chemist and has some knowledge of lubricating oil. Exercise great care in selecting oil for an air-cooled engine, and avoid unsealed tins. If the oil were not suitable it would carbonise badly, and your engine might seize. (2.) When the engine loses power through overheating, it knocks, and stops on hills; you can prevent overheating by driving with spark advanced, as little gas and as much air as possible, and using plenty of lubricating oil. (3.) The windscreen will, of course, make some difference when you are driving against a headwind, but we think the engine would manage it all right suitably geared.

Enamelling at Home.

Is it possible to enamel my motor bicycle and sidecar myself and make a good job of it? What is the best enamel to use (of course, I should not be able to bake it), and what is the best way of starting?—L.A.S.

Yes, it is possible to enamel a bicycle and sidecar yourself, but it requires some considerable care and trouble to make anything of a job. The machine should be taken to pieces, and the parts to be enamelled should have all old enamel removed and thoroughly cleaned with emery cloth. Really good enamel should be obtained, preferably one which does not dry too rapidly, such as Robbialac, or similar preparation. This should be applied carefully with a soft brush, and care should be taken to paint in one direction only. The parts should then be hung up in some clean dry warm place where they can be left to dry, after which one or two more coats can be applied. After applying the final coat, they should be left for at least a week to get thoroughly dry. It is very necessary that the place where the work is done, and especially where the parts are left to dry, should be as free as possible from dust.

Fitting a Long Exhaust Pipe.

I should be much obliged if you would tell me if, by fitting long exhaust tubes to a 1915 2¾ h.p. T.T. Douglas, I should obtain more speed and better results?—J. de F.

There is not much object in fitting a long exhaust pipe, unless there is a proper expansion chamber. This is necessary, both to deaden the sound of the exhaust, and also to assist the passage of the gases. Provided you place the expansion chamber fairly near the exit port, this has the result of reducing the pressure of the gases and of quietening them, while a long pipe further aids cooling, and consequently further lessens the pressure. The best plan is to remove all baffle plates from your silencer, and fit an extra pipe about two feet long.

A Badly-fitted Speedometer.

I have a 4¼ h.p. single-cylinder motor bicycle of well-known make. (1.) After attaching a speedometer the fitting caused eventually seven spokes to snap. Does this often happen when the drive is attached to the spokes? (2.) If I fit a hot air inlet pipe to my carburetter, shall I have to use the air lever much, or will it make it semi-automatic?—T.A.C.

(1.) Either the spokes are too slender, or the speedometer drive was badly fitted. We think the latter is more likely to be the case. The great secret is to get the wheels to mesh deeply enough to drive properly without being too deep to jam, and what we think has happened is that the driving sprocket was not set truly. (See article issue of Sept. 2nd, page 230.) (2.) Fitting a hot air pipe to your carburetter will not make it semi-automatic, but probably will result in your not having to alter the air lever so much. It will certainly improve the running of your machine.

THE MOTOR CYCLE Buyers' Guide

OF 1916 MODELS.

THURSDAY, Nov. 25th, 1915.

Since 1906 the Buyers' Guide has proved a much appreciated feature of this journal. In the absence of a Show, a Buyers' Guide of 1916 models becomes an urgent necessity. Thursday, Nov 25th, has been selected as the date of this issue.

Valve Timing.

I have a 3½ h.p. old Rex machine. The timing wheel slipped on the cone. In taking the gear plate down the timing wheels got mixed. There were no marks on the cogs. Will you please tell me the best way to set the valves properly?—NOVICE.

The valves should be timed as follows: Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. The inlet should commence to open as the exhaust closes, and remain open for one complete stroke of the piston, or while the flywheels turn through 180°.

Misfiring.

I look after an officer's motor cycle, and have recently been in trouble, and have been unable to rectify it. The machine is a 3½ h.p. 1914 model, with three-speed countershaft gear (5 to 1 on top). After about a speed of 27-28 m.p.h., it commences missing, and will not go above this speed. This occurs either straightaway from a cold start or after prolonged running. I have cleaned the engine, carburetter, and valves. The platinum points have been filed and different heights of petrol have been tried, but without avail. The trouble occurs with a person on the carrier or solo. The engine seems gradually to fade off and miss until the speed drops. I have tried a new plug as well. It seems to point to drying up, but there is plenty of petrol. The magneto fitted is a C.A.V. Ruthardt magneto, and the fibre bush which touches the cam is a wheel, and is very loose on the pin. Could this be the cause? It misses as badly on the lower gears, only, of course, at a relatively lower speed.—J.H.M.

We do not think the trouble would be caused by the contact breaker. It is possibly due to the valve sticking in its guide, owing to the stem of the former being too tight a fit. We should recommend you to take out the valves and see that they are working freely in their guides. Also, if the springs are weak fit stronger ones, and try increasing the gap of the plug points. Clean the magneto carbon brush and try a new plug. It would be advisable to fit a new fibre wheel.

Winter Riding.

(1.) I am anxious to continue to use my motor cycle through the winter for business purposes, which necessitate being out in all kinds of weather; but I do not relish the arduous task of cleaning the machine after a wet or muddy ride, yet if not cleaned it so quickly rusts. Is there any preparation that can be rubbed over the plated parts and enamel to keep the wet and mud from causing rust, so that there need be no need to be constantly cleaning; and if there is any such preparation, how often should it be renewed? (2.) What are the most practical accessories on the market for keeping hands and feet protected from the weather?—H.C.S.

(1.) We can only suggest vaseline, which you put on and do not clean off until the spring. Vaseline should be smeared over all the bright parts. (2.) There are numerous devices for keeping the hands and feet warm. For the hands, warm gloves and handle-bar protectors which fit over the handle-bar grips, while for the feet wear woollen socks, good easy fitting boots, and over these you may wear snow boots or Hutchinson boots.

A Choked Jet.

Three or four months ago I purchased a new 1915 twin. Soon after I was unfortunate enough to run into a carelessly driven taxi. In consequence I had to get a practically new frame, but the carburetter, engine, and magneto were overhauled (in a hurry) and declared in good order. (1.) The engine occasionally refuses to take top gear and knocks badly; then it suddenly runs as usual again. The plugs are clean, and the points the necessary distance apart, and everything else is in order. (2.) The engine suddenly refuses to take any air, and since the accident has taken less air than previously. As before, the fault gets right again suddenly. The petrol pipes and jets are clear. I suspect a crack in the carburetter at the junction of the pipe to cylinders. Would this be likely to cause the trouble, and how could it be remedied simply? I notice petrol escaping there when I flood the carburetter; should it do so? (3.) In the booklet I am told to inject paraffin as opposed to petrol. What is the reason of this? Would there be any disadvantages in using a mixture of petrol and paraffin?—T.L.

(1-2.) Both these symptoms lead one to suppose that the engine has a temporarily obstructed jet. This would account for the engine refusing to take top gear, knocking, and refusing to take air. There may be some foreign matter in the tank, petrol pipe, or carburetter, which obstructs the jet for a few seconds, and then is drawn into the engine. If there were a crack at the junction of the inlet pipes and the cylinder this would render the machine difficult to start, and unable to run slowly, and would also prevent it taking any air. (3.) The theory is that petrol washes away the oil on the cylinder walls, but paraffin acts to some extent as a lubricant. There is not very much in the theory; either petrol or paraffin will do.

Petroil.

I find a difficulty in properly lubricating the engine of my 2¼ h.p. two-stroke, and I have decided to mix the oil with the petrol. Is this possible? The carburetter is B. and B., but in place of a jet there seems to be a disc with four or five small holes in it. I should be pleased if you would kindly let me know the correct proportion of oil and petrol, also if there should be a certain amount in the crank case with which to start. I believe this would solve the problem.—J.H.K.

Mixing oil with petrol does not necessitate a special carburetter. The proportion is one of oil to sixteen of petrol. A slightly larger jet would be advisable. Evidently your jet is fitted with some sort of adapter. Possibly an ordinary jet will have to be substituted for this.

READER'S REPLY.

Two-stroke Lubrication.

One of your readers ("F.J.W.M.") asks you whether he would be wise to fit a Knight lubricator in place of "petroil" lubrication. I should strongly recommend him to do so as soon as he can. I had a Knight lubricator fitted to my Connaught in the spring, and I would not be without it on any account. The lubrication is perfect, I use less oil, can keep almost perfectly clean, and get no involuntary four-stroking, like I used to. Further, the carburetter will now take a smaller jet, No. 23, and I can get ten to twenty miles more to the gallon than I could before. Also starting is much easier, because the oil does not gum up in the carburetter when the engine gets cold and the petrol evaporates. I was often troubled in this way before the alteration, the carburetter sometimes refusing to take any air. Time, trouble, and expense are saved. My attitude towards the disgusting mixture known as "petroil" may be described in two words—Never again! I am much surprised that no firm appears to have yet adopted this simple device as a standard. I have no interest whatever in the firm, but I recognise its members as experts.—H. LEWIS.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"L.S.K." (N.B.)—6 h.p. Enfield as a double-purpose machine.

"H.O.W." (London).—3½ h.p. Triumph for solo and sidecar work.

"E.P." (Southsea).—1914 two-speed Douglas with clutch and kick starter.

"T.R.M." and "J.C." (Birmingham).—Philipson governor pulley for sidecar work.

"A.B." (Cheshire).—1915 No. 1 Grand Prix Morgan. Comfort, reliability, maximum speed, and consumption.

"M.F.A." (Somerset).—5-6 h.p. Ariel. Efficiency of chain-cum-belt drive compared with chain drive for sidecar work.

RECOMMENDED ROUTES.

LONDON TO FISHGUARD, and distance.—M.J.K.

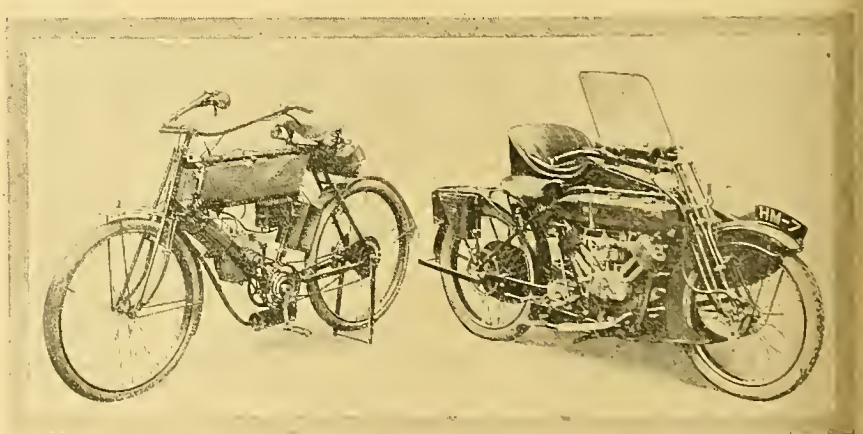
London, Brentford, Hounslow, Colnbrook, Slough, Maidenhead, Henley, Wallingford, Wantage, Faringdon, Fairford, Cirencester, Gloucester, Cinderford, Coleford, Monmouth, Raglan, Abergavenny, Crickhowell, Llandovery, Llandilo, Carmarthen, St. Clears, Haverfordwest, Fishguard; or Llandovery, Swargate, Newcastle Emlyn, Cardigan, Newport, Fishguard. Distance is approximately 246 miles.

WINDSOR TO SEVENOAKS, and distance.—J.R.

Windsor, Staines, Hampton Court, Kingston, Sutton, Croydon, Westerham, Sevenoaks. Approximately 47 miles.

TORQUAY TO LONDON.—W.C.S.

Torquay, Teignmouth, Dawlish, Exeter, Sidford, Colyford, Lyme Regis, Bridport, Dorchester, Bere Regis, Wimborne, Ringwood, Cadnam, Totton, Shirley, Bassett, West End, Botley, Bishop's Waltham, West Meon, East Tisted, Alton, Farnham, Hog's Back, Guildford, Ripley, Cobham, Kingston, London.



FIFTEEN YEARS OF PROGRESS.

A 1900 1¾ h.p. P. & M. motor bicycle which is in excellent order, and up till quite recently in use, and the very latest twin-cylinder four-speed P. & M. sidecar.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed ~~& Co.~~

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade Labour Exchange, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

MOTOR CYCLES FOR SALE.

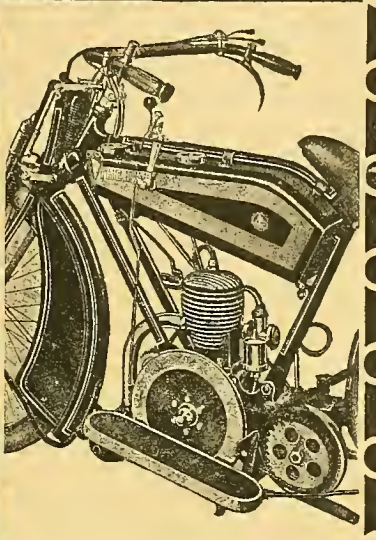
The "IVY" TWO STROKE

TRADE MARK



Above illustration shows our new pattern frame, that will from now be fitted to our "De Luxe" Model Two-Stroke machines only. It is our registered design No. 531848, and the principle is as follows:—Instead of the usual round down tube coming from the ball head, we bring two oval blades from a specially designed ball head down on each side of the exhaust pipe to the crank case. Each of these blades is double the streugth of the ordinary round down tube, and is made of a specially toughened steel which will stand being twisted a number of times without breaking. This frame is no heavier than the ordinary diamond frame, and is

ABSOLUTELY UNBREAKABLE.

Other exclusive features of our "De Luxe" model are—

Special shaped tank, holding 1¾ galls. petrol, ½-gall. oil; comfortable footboards; machine enamelled khaki-grey: marvellously efficient engine, etc.

It is no wonder the machine is called

THE ARISTOCRAT OF ITS TYPE

War Funds and Winter.

OF late quite a number of appeals have reached us from men at the Front to send out articles of one sort or another. The letters in question are from men actually using motor cycles, and, much as we should like to satisfy all the wishes expressed, yet we find it impossible. Some correspondents have suggested that we should organise a fund, and were we convinced that nothing was being done for their comfort we would not have hesitated long in doing so, but we know quite well that, apart from official consideration of winter requirements and the equipment to be provided, practically every large town is organising a fund for the benefit of its local representatives at the Front. For instance, Nottingham is endeavouring to raise £8,000, Coventry £5,000, whilst several daily papers already have large funds at their disposal. Extensions of the scheme would, we feel, only lead to overlapping and confusion, but the chief point which weighs with us is the fact that hundreds, nay thousands, of our readers are not serving in motor cycle sections at all, but are in the line, or in Army and Navy sections in which their motor cycle experience is of little or no advantage. All such would have to be left out of any scheme we might introduce, on account of the difficulty in tracing the motor cyclists, that is even supposing that a general desire to single out any class for special favour was prevalent. This is decidedly not the wish of the authorities, least of all the persons intended to be so favoured, who realise, as no one else can, the privations of the men in the trenches. Therefore we can only urge our readers at home to support their local funds to the best of their ability so that everyone shall benefit. As showing the difficulties with which any scheme of differentiation is beset, we may mention that a fortnight ago we published a request from a mechanic for a football for the use of himself and colleagues. A letter in the current issue takes exception to this appeal, on the ground that men earning six shillings per day are well able to buy little comforts and luxuries with spare cash. It is the men in the trenches earning a shilling or so a day, who, the writer argues quite reasonably, should receive any little attention which we are able to provide.

Desirability of Clutches in Lightweight Gears.

IT is to be hoped that the lightweight two-speed gear will, ere long, be fitted with a friction clutch as standard. Up to the present, the two-speed gear operated by the simple dog clutch has answered its purpose very well indeed, but as lightweights are being looked upon less and less in the light of "potterers'" mounts, but more as practical touring machines in fairly level country, the steps in the ratios provided are being increased. This means that a positive form of clutch is not a real success in the hands of a novice. The change from low to high gear when the ratios are approximately 10 and 5 to 1, means a certain snatch and jerk, which is not good for the engine, transmission, or tyres. This violent jerk can be entirely avoided and a comfortable change provided by the simple expedient of introducing a friction clutch which may be disengaged when it is desired to change gear up or down. The fact that the lightweight machine attracts in increasing numbers the absolute novice means that a foolproof machine is particularly desirable. We have personally witnessed novices climbing a hill on the low gear, and long before the requisite speed had been attained, engaging the high gear. This has resulted in snatching and knocking, which was very bad for the machine as a whole. Quick engagements of high or low gear at inopportune moments are inevitable in the life of a machine with a positive clutch, and the excessive strain can be entirely avoided by adopting a simple slipping medium such as is provided by the wonderfully efficient cork insert plate clutch.

An index to the advertisements in this issue will be found on the page facing the back cover.

A Business Sidecar.

A friend of mine has a Campion sidecar with Jardine gear in daily use for business purposes, and speaks very warmly of its merits. He makes the interesting suggestion that every sidecar should have a brake fitted with a pawl and ratchet holder, or other locking device, so that it can be safely left standing on a hill in its owner's absence. One day he was calling on a customer, and left his machine in the usual fashion, with a gear engaged, the clutch (as he thought) in, and the back wheel chocked against the kerb. As it happened, the compression was rather poor, the engine having done several thousand miles since its last tuning, and the clutch plates were barely touching, as the pedal was not fully engaged. When he came out he saw the machine rushing down hill with the engine firing. Since the clutch was not fully engaged, gravity had started the machine, which had run back on to the road, swung round under the pull of the sidecar, and then started its engine. He further told me of an odd experience in the way of misfires, a wet autumn leaf having blown on to one of his sparking plugs and shorted it, when he was doing thirty along the open road. He mocks at the luxurious hoods and screens so fashionable nowadays. In lieu of such fittings he carries an old umbrella, with the tip and handle of the stick sawn off, which his passenger uses to shield her head and body from rain.

The Control of Four-cylinders.

Mr. Robertson-Brown takes exception to my ideas on the subject of the control of four-cylinder machines. He says that a valve lifter is an unnecessary complication, in which I am inclined to agree with him. He emphasises what is obvious in remarking that it is a simple matter for a customer to adjust his throttle to shut off all gas from the engine, or to fit a handle-bar switch; indeed, he is ready to supply any Henderson so controlled to order. Where I differ from him is in respect of the desirability for car control for motor bicycles, subject to the substitution of a hand clutch control for the usual car clutch pedal. I like a throttle which just does *not* shut, and I regard a switch as a crude method of cutting out an engine temporarily. If there is no valve lifter, if the throttle does not shut, and if the switch is not used for temporary slows, surely a foot clutch is eminently desirable? A side lever clutch implies the removal of a hand from the steering bar every few yards in heavy traffic, and the alternative of a handle-bar clutch lever is bad, first because it is not yet standard, and few motor cyclists instinctively perform the requisite action in emergencies; secondly, because up to date it has not proved possible to design a handle-bar clutch control which does not require a lot of hauling out. In my opinion those firms who adopt the principle of car control for high-powered multi-speeded motor cycles should fit a foot clutch, and the Henderson clutch is such a beauty that it is well adapted to foot control.

A Second-rate Two-stroke.

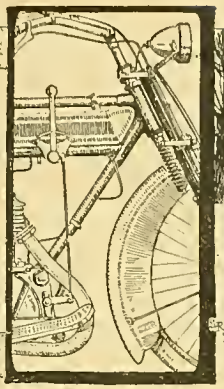
I have often asserted that two-stroke engines vary enormously in quality, and advised nibblers to insist on a trial before purchase; but a wee puffer that I struck to-day was the absolute limit. Not but what it climbed strongly enough, and started easily. But as compared with my well worn Levis of happy memory, and several other leading makes which I have owned or sampled, it was what the bookmakers would call a "stumer." It has defied all adjustments aimed at making it two-stroke down to ten or twelve miles an hour, and obstinately insists on four-stroking at every lesser speed. Its open release valve creates more noise than the exhaust, so that a hooter is quite unnecessary. The engine vibration at all speeds reminds me of the first 3½ h.p. I ever rode, which chanced to be a Minerva, clipped to the front down tube of a very whippy and lanky push-bicycle frame. Accelerative powers are conspicuous by their absence; the engine possesses two settled speeds, one for the level and the other for hills.

A Motor Cyclist in the Transition Stage.

A correspondent who has reached the phase when he seeks for more weather protection in daily winter work writes to ask my comparative opinion of the Carden monocar, the sporting Morgan, and the Baby Peugeot. Pity the poor journalist. It is pretty clear, surely, that here we have one of those common dilemmas soluble only by weighing personal fads against price considerations. The Cardan stands practically alone in its class, and its appeal depends partly on its very low price, and partly on those considerations which make some riders prefer four wheels to three, such as tyre accessibility. The Morgan supplies cosy accommodation for an extra passenger, has an unparalleled reputation in the cycle car world, and its single rear wheel need not imply side-slips even on the greasy setts of the northern cities under violent braking emergencies. The Baby Peugeot is a car, and enjoys all the advantages of the car; but, being a car in miniature, it must equally suffer from the disadvantages of a miniature car. If it is more comfortable and better protected than the cycle car proper, if its mechanism is concealed, instead of bristling into positions on to which rain and dust and mud may be flung, its small engine presupposes some warming up before full power is available on cold mornings, and the lack of reserve power suggests that the owner should be a clever tuner. The multiplicity of internal frictions imply that the simpler Cardan and Morgan can outpace it, especially uphill; and the squat wheelbase hints at a tendency to skid under really bad conditions, which must be countered by clever driving and sound tyre treads. Yet who would dare to say which is the best of the trio for an unknown enquirer's use? There are men who would love any one of the three, and refuse to be seen on the road with the others, so strong are individual preferences and antipathies.

Chain-cum-Belt Transmission on Big Twins.

By H. MORTIMER BATTEN.



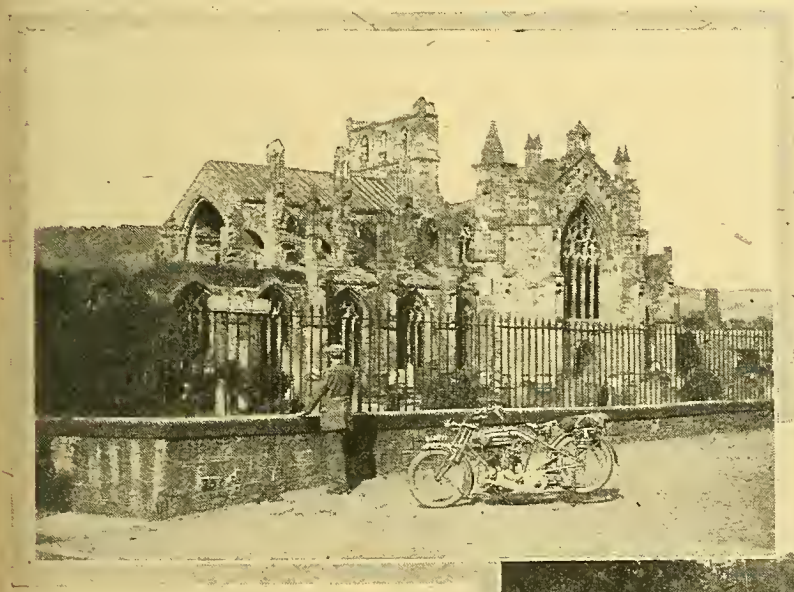
THOUGH the "all-chain" drive has gained general popularity for heavy sidecar machines, there is still a good deal to be said in favour of the properly designed chain-cum-belt system, and having had experience of the latter it is difficult to convince oneself that it is not better suited to the demands of a certain class of rider than the all-chain drive.

Carelessness on the part of the designer is very often the cause of failure in the case of the chain-cum-belt system. On two 1915 machines I have ridden with this system of transmission, I was horrified to find that one bottom corner of the rear wheel mudguard actually overhung the lower stretch of the belt, between the pulley and the rear wheel drum, with the result that the belt was subjected to a constant stream of drips from the guard when negotiating wet roads. This sort of thing is, of course, ridiculous, and is bound to result in belt slip after every shower.

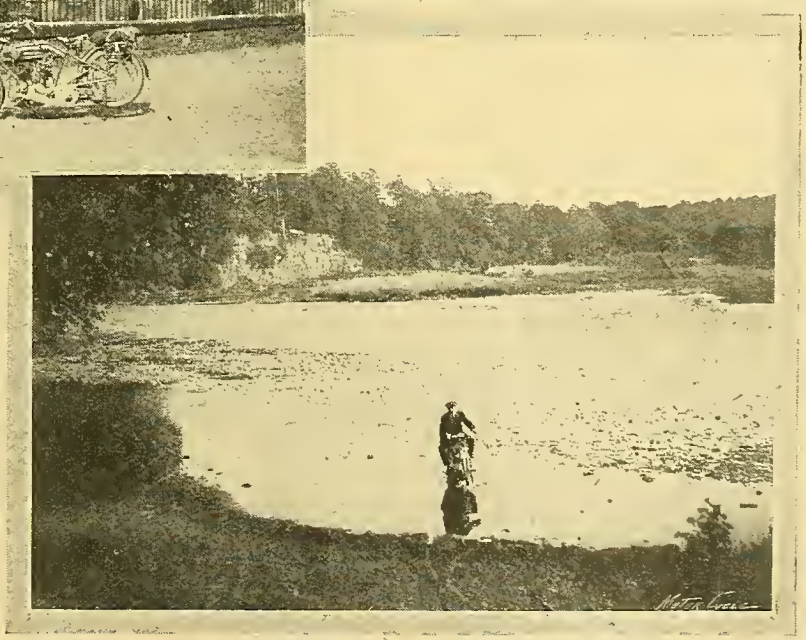
Again, why will manufacturers insist on making the pulley and belt drum so narrow that the belt rides on the extreme top of the grooves? Any oil that collects on the pulley, or any water splashed on to the drum, is thrown to the outer rim and is worked deep into the groove by the warmth and movement of the belt. A certain amount of oil, either from the chain or from the countershaft bearing, is bound to find its way on to the pulley rims sooner or later, but if the belt were riding deep down in the groove oil would be flung from the edge of the flanges without coming in contact with the belt at all.

Both pulley and belt drum, therefore, should be wide and deep enough to take a very much larger belt than practice demands, so that the belt used lies snugly below the rims of the driving members, more or less secure from oil and water that collects upon them.

Such small points are apt to make all the difference in the working of belt transmission, but since, with a little care on the part of the



Melrose Abbey, N.B. The motor cycle is a 5-7 h.p. chain and belt driven Abingdon King Dick.



Crossing the River Tweed by one of the many fords in the vicinity of Peebles.

Chain-cum-Belt Transmission on Big Twins.—

designer, such defects would not exist, they cannot justly be regarded as permanent drawbacks to this system of transmission. We have given the chain drive a degree of shelter and protection from the elements that the belt drive has never enjoyed, and though perhaps it would be difficult to arrange in the latter case, it is surprising that more effort has not been made to afford the belt at least sufficient shelter to render it reasonably secure from periodical drenchings of oil and water.

Taking it, then, that details of design are well thought out, and that the pulley is of sufficient diameter to assure immunity from belt slip and reasonable wear, what are the advantages and disadvantages of the geared down belt drive as opposed to all-chain drive for adaption to heavy machines?

Advantages of Chain-cum-belt Drive.

Dealing first with the advantages, to my mind there is no question that the chain-cum-belt is generally sweeter in transmission than the all-chain drive. Hitherto I have pinned a good deal of faith on the 3½ h.p. chain-driven single as an economical mount, but on my present 5-7 h.p. chain-cum-belt twin I am obtaining an infinitely greater mileage per rear cover than I have ever obtained with a 3½ h.p. chain drive. The difference amounts to something in the neighbourhood of 2,000 miles, the tyres used on both machines being identical, and the rubber bill in the case of the 3½ h.p. mount was not abnormal. This is an important point, for it augurs that not only the rear tyre, but the engine and gears are saved proportionally.

Another feature in favour of the belt drive is its cleanness and extreme simplicity. It is the simplest of matters to slip off the belt when adjustments of some kind are to be made, whereas my recollections of the corresponding task in the case of the enclosed chain drive are by no means fragrant. The slow speed belt is by far the simplest system of transmission we have, besides being the cleanest and the most easily adjusted; and these are points one might do well to ponder before condemning the belt drive as unsuitable for heavy twins. The minds of many of us are poisoned by recollections of the direct belt drive of a bygone age, but with the geared down variety we are up against an entirely different proposition.

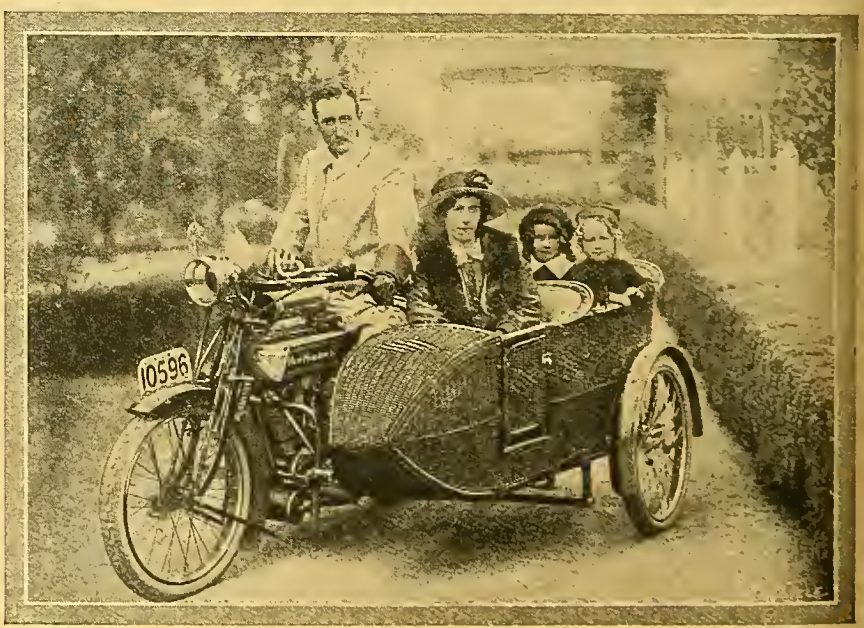
The softness of this form of transmission is, to my mind, its special feature, for however effective the shock absorbing device on the transmission of an all-chain twin, one does not obtain that silken torque peculiar to the belt drive. On my present mount it is possible to come almost to a standstill with the engine ticking over on top gear, yet the machine picks up instantly without a suggestion of snag or konk. I have yet to ride the chain-driven twin with which I would think of taking such liberties.

The wear on the belt is almost a negligible quantity, and certainly it is more than balanced by the reduced wear on the rear tyre. Judging from my own experience the chain-cum-belt drive is very considerably more economical than the all-chain drive, and for the average pleasure rider the system has many recommending features.

The Disabilities of Belts.

Coming now to the disadvantages of geared down belts for heavy twins, we have first and foremost the belt slip nuisance in wet weather or in crossing water-splashes. Many prominent advocates of the belt system have tried to convince me that the modern application of belt transmission has reduced the likelihood of slip so considerably that it need no longer influence one's judgment, but I still adhere to my own views with stolid British stupidity. I consider myself a rider of average intelligence, yet my humble opinion of belt drives is that they all slip, more or less, in wet weather. With a 5 h.p. engine thumping away and a heavy sidecar attached, more slip takes place even with the belt running dry than one realises, and if the belt accumulates oil or moisture the slip is apt to become a nuisance.

It is of no use pretending that the trouble does not exist, for it is the real defect of the system, and unless very elaborate guards are resorted to the rider who goes anywhere and in all weathers is sure to find it out for himself. On my present mount it has not yet stopped me or necessitated a wet and clammy adjustment at the roadside. I have always managed to get over the brow with the engine pulling steadily, but



A CHAIN-CUM-BELT DRIVEN FAMILY SIDECAR OUTFIT.

Mr. J. W. Stocks, Clerk to the Council of Young, New South Wales, who has been using a New Hudson "Big Six" sidecar during the last year. It is interesting to receive confirmation that the sidecar combination has become immensely popular in Australia, and Mr. Stocks speaks with enthusiasm of the enjoyment he has derived from his machine.

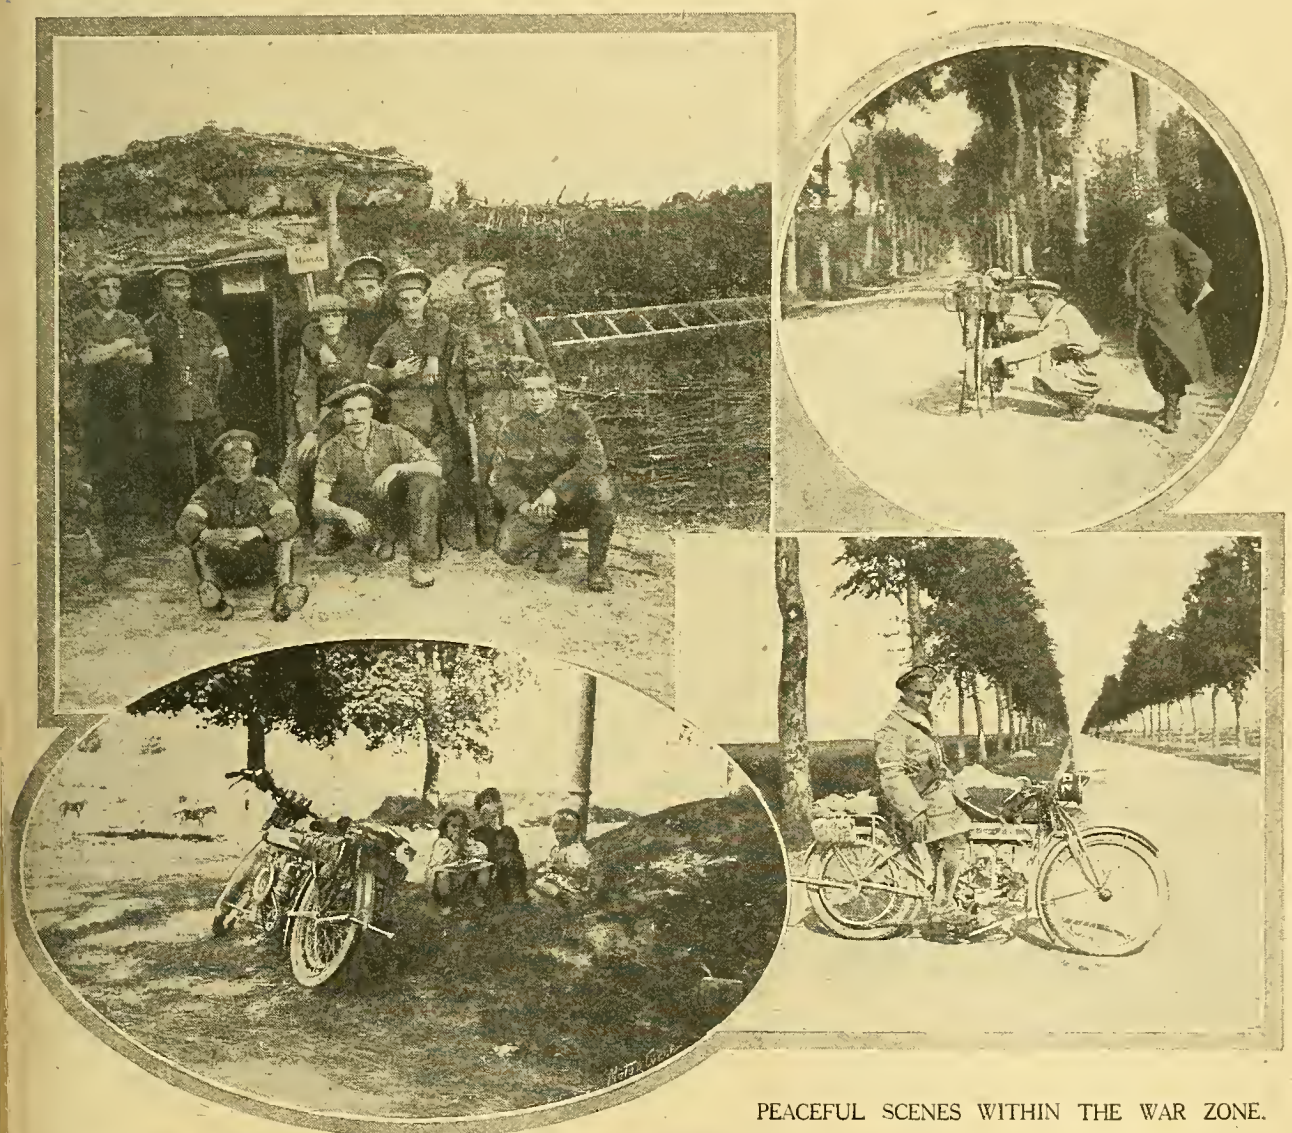
Chain-cum-Belt Transmission on Big Twins.— more than once I have found myself unable to thunder to the crest of the hill at full throttle owing to belt slip.

Even then I do not consider this defect outweighs the many advantages of the chain-cum-belt transmission for the modest tourist who does not desire to blind for hours on end through pelting rain with the sidecar piled up with luggage and the fair one. That he will have fewer rear tyre troubles than if the transmission were of the all-chain type, that he will find his machine easier and pleasanter to handle at low speeds, and probably that he will find it cheaper to run both as regards upkeep and depreciation, it is quite reasonable to expect, but in return he must be willing to keep the belt clean and at the right tension.

There is no reason to think, therefore, that the chain drive will finally supersede the geared-down belt for transmission of heavy machines, and certainly it is not probable that the belt system will ever attain the popularity of the all-chain. Still, it is unwise to be prejudiced; there is room and demand for both. For the powerful solo twin the chain-cum-belt system would probably be hard to beat, for in this case one would obtain its advantages without its disadvantages being so pronounced.

WHITEWASHED KERBS.

With regard to the whitewashing of kerbs, the A.A. has communicated with every municipal corporation in England, suggesting the adoption of this method of protecting road users at night. The response has been extremely satisfactory. One very interesting reply came from H.M. Office of Works to the effect that the kerbs at Menai Bridge, which is in total darkness, are to be whitened.



PEACEFUL SCENES WITHIN THE WAR ZONE.

The Four-cylinder Henderson on the Road.

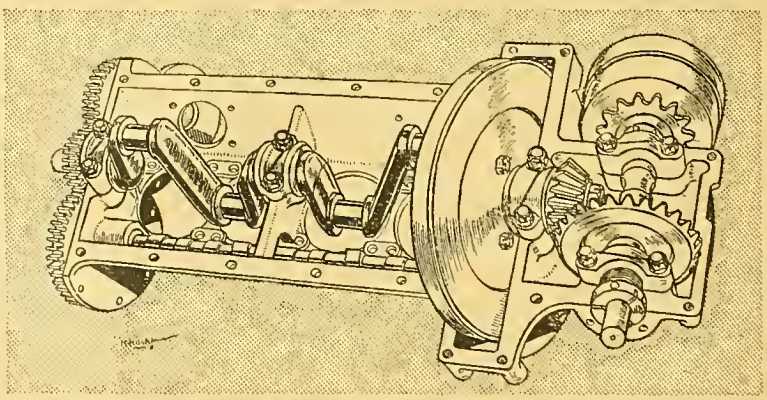
8 h.p. Engine, 67 × 76 mm. Bore and Stroke, 1,072 c.c.; Two-speed Hub.

YEARS ago in the dim and dark ages of motor cycle history, when change-speed gears were non-existent and 3½ h.p.'s were considered too powerful to be safe, the Editor of *The Autocar*, at an Auto Cycle Club (now the Auto Cycle Union) annual dinner, ventured to prophesy that the four-cylinder motor bicycle would have a great future. Now the four-cylinder motor bicycle has long been with us, and, though it has had some adherents, it has never had the popularity of the twin. It is not our intention to go into the whys and wherefores of this at the present moment, but it suffices to say that in the Henderson we have actually on the market a four-cylinder motor cycle which is one of the most perfect two-wheelers we have ever had the good fortune to drive. It has been dealt with on several occasions in these pages, and we have not hesitated to admire its original design, but until a certain week-end we had not had an opportunity of testing its running in the open country. On the occasion of the introduction of the new model E, that is to say, the new short (58in.) wheelbase type, we had a short run in the neighbourhood of Great Portland Street, which gave us a keen longing to try the machine in the open country.

A stop at an important road junction at Riverhead.

On a recent Saturday afternoon one of these new models was placed at our disposal by Messrs. Robertson's Motors, 157b, Great Portland Street, and a few more words concerning it, previous to describing its behaviour on the road, will doubtless be of interest. The chief departure from standard was the fitting of wide handle-bars provided with Pedley rubber grips, which, by the way, are most comfortable, while ordinary British Bowden handle-bar control was supplied to actuate the magneto advance and the Schebler carburetter. This to one who had never before driven the machine was a veritable godsend, although those who are accustomed to it prefer the American style twist handle control to any other, but experience is necessary before this method can really be appreciated.

The four-cylinder engine, air-cooled and with passages between the valve chambers and the cylinder to aid cooling, with its overhead valves, follows car practice pretty closely. Its design comprises commendable originality, and is yet totally devoid of freakishness. Lubrication is arranged on the gravity drip principle, which preserves a constant level in the base chamber, the general oiling being effected by the splash system, and the big ends scooping up oil from troughs. This arrangement is perfectly satisfactory in the hands of the intelligent user, but we suggest that the tap controlling the drip could be easily interconnected with the switch, so that the engine could not be stopped without the oil being turned off. As arranged at present, it is possible for a thoughtless driver to leave the oil on, and to find next morning the base chamber full up, resulting in waste, clouds of smoke, and perhaps ultimately a complete stoppage of the engine. As we mentioned before, the carburetter is the popular American Schebler, which gives perfect slow running, extremely rapid acceleration, economy, and plenty of power, while means are provided and full instructions are given for adjusting it to suit varying atmospheric conditions. It is adequately warmed by means of the exhaust, the main air intake passing right through the silencer expansion chamber.



Crank case, three-bearing crankshaft, flywheel and transmission gear of the Henderson.

As the crankshaft is set longitudinally, it is necessary to use a bevel drive to convey the power from the engine by chain to the rear wheel, which makes us wonder why the makers have not incorporated a simple dog clutch two-speed gear in the crank case unit instead of employing an epicyclic gear in the rear hub. Possibly, however, they have their reasons for not doing so. The excellent plate clutch is controlled by a long lever working in a quadrant on the near side of the tank, adjacent to the change speed lever. This arrangement has been greatly improved by Messrs. Robertsons, who provide a Bowden control for the clutch, which greatly simplifies its opera-

BOWDEN WIRE LTD. LONDON

PRATT ST., N.W.

Established 1897.

BOWDEN WIRE MECHANISM
For effectively controlling all movements from the handle-bar. Made in various strengths and finishes.

BOWDEN CONTROLS.
Levers for Brakes, Clutch, Air Inlet, Magneto, etc., controls. Made for right or left hand, for one to three movements.

BOWDEN TWO-SPEED GEAR.
A very simple countershaft gear with kick-starter. Can be fitted to a number of machines without any—to most with slight — alteration. Guaranteed for engines up to 6 h.p.

BOWDEN RAPID VALVE GRINDER.
Helps to grind a valve quickly and with absolute accuracy without dismantling the cylinder. Most efficient. Acts also as Valve Spring Lifter.

STOPS, PORTABLE CLIPS,
etc., and all necessary fitments for use with Bowden Wire Mechanism.

Godbold.

Concerning Tyres for Lightweight Machines.

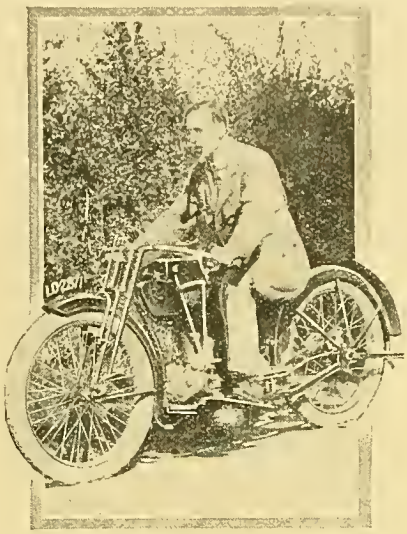
The Four-cylinder Henderson on the Road.—

tion in traffic, as it can then be withdrawn without removing the hands from the handle-bars. The particular machine we tried was quite new, and not even properly run in, and so the modernised clutch control was not in place. Consequently, we negotiated the traffic somewhat gingerly at first. We omitted to mention that the engine is set in motion by a handle, which is pulled up, and after starting, which is quite easily effected even from cold, folds neatly away. We rapidly, however, gained confidence and in a few yards we were revelling in the glorious smooth running, extreme controllability, and superb acceleration of the engine.



The four-cylinder Henderson on the road.

Our first ride was to a village some miles beyond St. Albans, which town we approached *via* Barnet, the road for some distance being nicely corrugated owing to the motor omnibus service running thereon. It is interesting to note that, within limits, the faster we travelled the greater was the comfort we experienced. This run gave few opportunities for speed, and as few for testing the hill-climbing power of the machine. Still, each side of Ridge Hill gave us some idea of what the Henderson could do in this respect. We were also able to note the smoothness of the engine, which possesses absolutely no objectionable period, whilst its response to the slightest opening of the throttle and its ability to run at slow speeds are simply marvellous.

The next day our drive was in the country south of London. Here we had plenty of hills to try, the first of which was the one which leads from the main Eastbourne road to Upper Warlingham. To say that the Henderson treated this as level ground appears to be but making use of a somewhat hackneyed expression, but its behaviour can be described in no other way. The hill, which is quite a good pull and will bring a good four-speed car down to second, was absolutely ignored. Titsey Hill, despite an obstruction on the steepest portion, was equally well climbed, while on Westerham, which we took in the evening, the machine was simply a revelation. The cross roads were taken with extreme caution, and then for the first time that day, after a good run in hilly Kent, the throttle was actually opened to its fullest extent, but hardly had this happened than it had to be closed again, for the first corner, and after this had been negotiated, the engine was picking up speed on the 1 in 8 gradient, as if the ground were flat. Such sensations of power cannot be enjoyed on any other vehicle than a powerful car, and yet the Henderson is as docile as a lamb in thick traffic or on greasy roads. It is heavy, it is true, but it is 25 lb. lighter than several American twins. It is also economical in petrol (70 to 80 m.p.g. we are assured). As no mileage recorder was fitted, we were unable to make an accurate test, but we can truthfully say that the consumption of spirit is small. Tariff or no tariff, the Henderson will sell among that section who like luxurious riding and ignore weight, as it is in its class quite without rival on the British market.

WITH THE M.M.G.S. IN FRANCE.

On the left two men are shown using a range finder. They are lying on the top of a trench dug in the farm-yard of their temporary headquarters.

The second illustration shows three motor cyclist scouts. They are, from left to right: W. P. Jamieson, J. J. Swann, and T. Saunders — all Douglas mounts.

NEW MODELS

· MANUFACTURERS' PROGRAMMES FOR 1916 ·

CAMPIONS IN 1916.

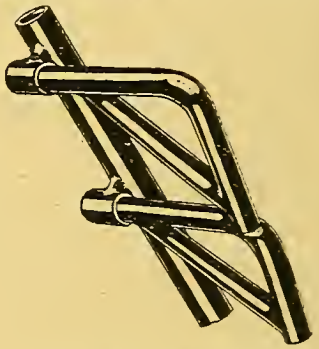
Two Heavyweights (including an 8 h.p. Four-speed Mount) and Two and Four-stroke Lightweights.

ONE of the sturdiest built high-powered machines which we have yet inspected is the new 1916 model 8 h.p. four-speed Campion-Jap. This mount is obviously intended as a go-anywhere passenger outfit, but, nevertheless, it is not an impossible solo mount, for we have ridden a machine of exactly similar type, but with combined belt and chain drive, as a solo mount, and its flexibility was remarkable. The mount illustrated is the latest production of the Campion Cycle Co.'s works; finished in khaki, it strikes the observer as a machine quite out of the ordinary run, but it embodies nothing experimental in its design, being just solid recognised practice throughout.

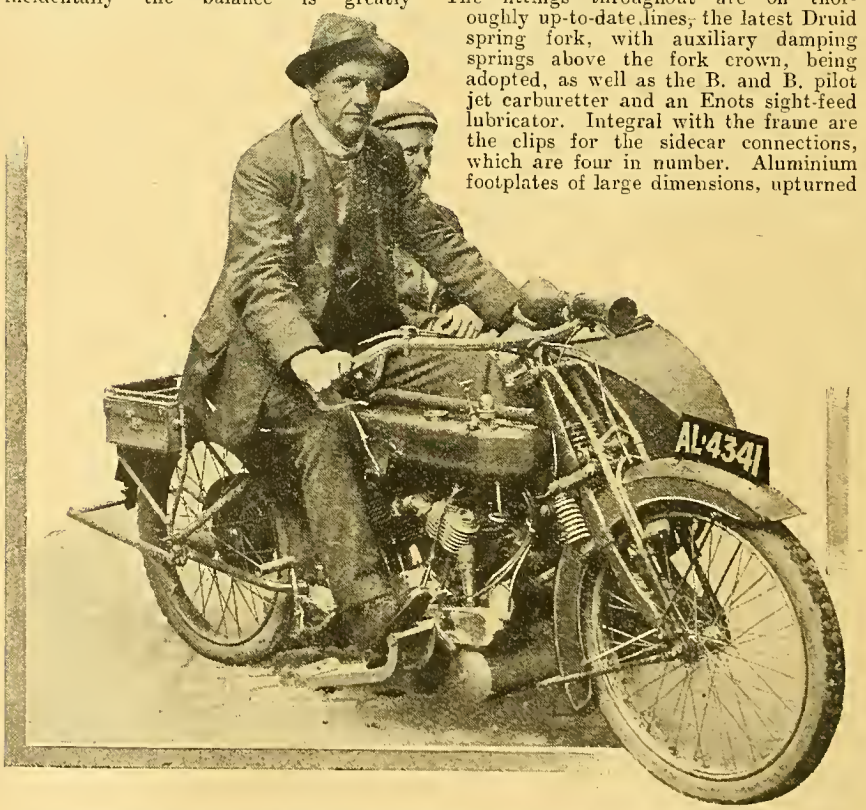
The engine is an 8 h.p. side-by-side valve J.A.P. of the new type, and incidentally the balance is greatly superior to earlier engines of this pattern. The front engine security plate performs a triple purpose. It forms a platform for the Splitdorf magneto, and neatly tucked under the platform is the circular expansion chamber of generous dimensions, a long exhaust pipe with saw-cuts conveys the gases to the rear.

Internal Expanding Brake.

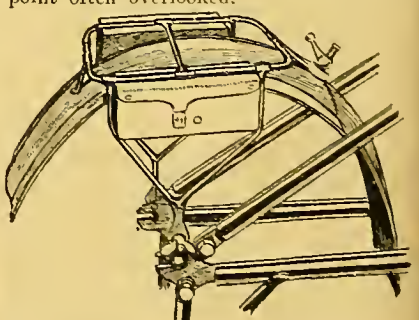
The gear box is of the new pattern Jardine four-speed type, giving one free-engine position only. Chain transmission is used throughout, and combined with the rear sprocket is a 7¼in. Ferodo lined brake of the internal expanding type, operated by the usual toggle lever movement. The second brake is the ordinary rim pattern operating on the front wheel. The transmission is entirely enclosed. The fittings throughout are on thoroughly up-to-date lines, the latest Druid spring fork, with auxiliary damping springs above the fork crown, being adopted, as well as the B. and B. pilot jet carburetter and an Enots sight-feed lubricator. Integral with the frame are the clips for the sidecar connections, which are four in number. Aluminium footplates of large dimensions, upturned in front and provided also with heel rests, have been adopted. Two pannier tool-bags, with metal protectors at the back and sides to retain their shape, are used, whilst to facilitate repairs to the rear tyre the carrier is secured on both sides by wing nuts, and the top portion of the mudguard by a hand nut. The removal of these three connections enables the whole rear portion to be removed in a very short space of time. The mudguarding is of modern design, the front guard having side extensions for its whole length, and the rear guard wings extending from the saddle springs to well below the transmission—a small but important point often overlooked.



Showing the stiffened supports at the front of the Campion sidecar attachment.



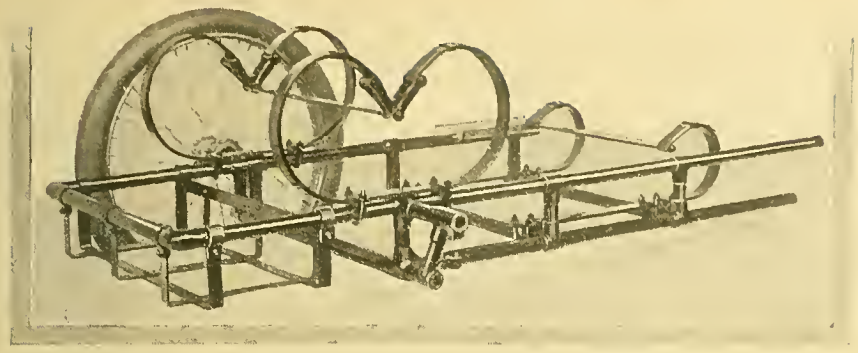
George Hunt on the new four-speed 8 h.p. Campion. Mr. Hunt, it may be mentioned, is the holder of the 24 hours cycle paced record, having covered over 400 miles in 24 hours.



Detachable guard and carrier on the Campion to facilitate tyre repairs.

The 8 h.p. Campion is obtainable not only as a solo mount, but complete with sidecar outfit, handsomely finished in khaki.

The sidecar is by no means to be passed over, for not only has it four-point



Showing the special springing and chassis design of the Campion sidecar. Note luggage grid.

attachment, which is now generally demanded by experienced riders, but the two bent tubes in front, which are necessarily used, are stiffened by two struts forming a triangle. Still the springing of the sidecar is the most attractive point of the Campion, for double "C" springs are used, together with long links, reminiscent of the springing of carriages in the early Victorian era, which give a movement and a degree of comfort comparable only to expensive cars. A luggage grid at the rear of the frame is a standard fitting on the Campion sidecar.

The Jardine gear being obtainable with a foot or hand-operated clutch at option, the Campion Company offer their customers a choice of these fittings.

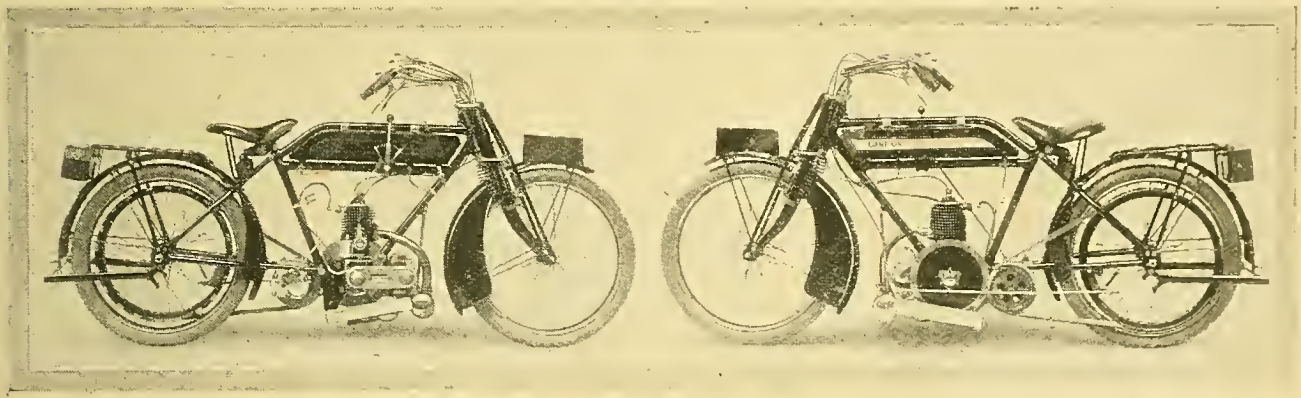
A 6 h.p. J.A.P. engine may be obtained in place of the 8 h.p. engine if desired.

Lightweight Campions.

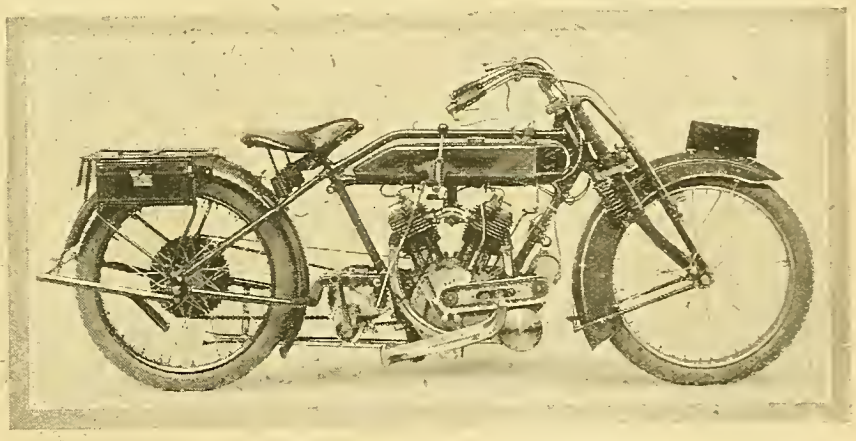
The Campion Company do not confine their attentions to any single model, but produce machines which appeal to all classes of riders. We are able to illustrate two further 1916 models of the Campion range, both of them lightweights, one fitted with a Villiers two-stroke engine of 70×70 mm., the other having a J.A.P. four-stroke engine of 2½ h.p. (70×76 mm.). These lightweights have black hubs, a black tank, and chain and belt transmission, the chain being enclosed. Footboards, too, are provided. In the case of the four-stroke, a Jardine two-speed countershaft gear is used, whereas the two-stroke model has an Albion gear, with the transmission arranged all on the left-hand side of the machine. The two models also differ in that a B. and B. pilot jet carburetter is fitted on the right-hand side of the four-stroke model, whereas the two-stroke is provided with an Amac carburetter. The toolbag is placed at the rear end of the carrier, and is protected by metal casings, access being obtained to the bag from one side. These two lightweights are handy little solo mounts, which are selling in large numbers.

A Trip on the Road.

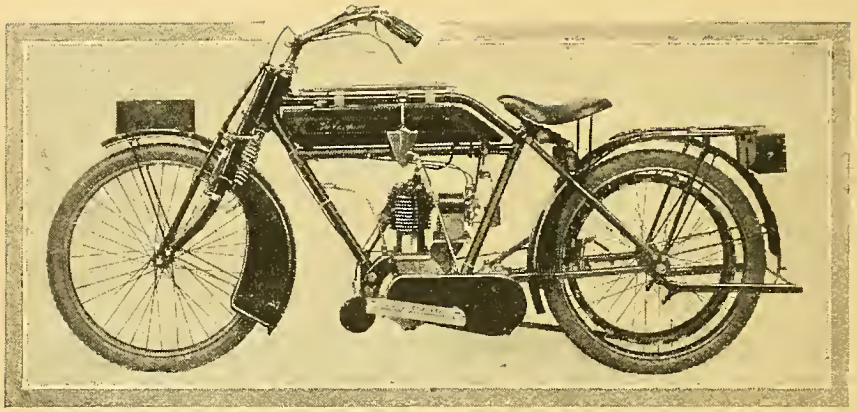
A road test of the new 8 h.p. Campion model was proffered by Mr. George Hunt (the sales representative of the firm), which we gladly accepted. The reserve power provided by such a big twin is most attractive. The slightest touch of the throttle lever and the machine bounds away like a thoroughbred, whilst as to hills one never notices them, as with the four gears, even with the high top ratio that is provided, one can toy with single figure gradients. The Coventry neighbourhood does not abound in steep hills, Stoneleigh being the only gradient of note in the district, so we wended our way thither, and, despite the fact that one cannot rush at this hill, owing to a right angle bend almost at the foot, it was possible to effect most of the climb on the top gear, whilst the engine roared away on the third ratio over the summit. Descending the hill, we tested the ease of changing when accelerating speed by starting from a standstill on the low gear, and changing gear by gear higher, and, as showing how beneficial intermediate gears are in acceleration and hill-climbing, it was possible to get the top into engagement just before the summit, and finish the climb with ease. A further test, which many will consider unfair, but which we were invited to make by Mr.



The two-stroke Campion which is fitted with a two-speed gear and chain-cum-belt drive. As will be gathered from this illustration alternative tank finishes are offered by the makers.



A high-powered sidecar mount—the new 8 h.p. twin-cylinder Campion—which has all chain drive and a Jardine four-speed gear. All chains have cases, but when photographed the latter were removed.



The four-stroke Campion lightweight. The engine is a 2½ h.p. J.A.P., and a two-speed countershaft gear in conjunction with chain-cum-belt drive is adopted

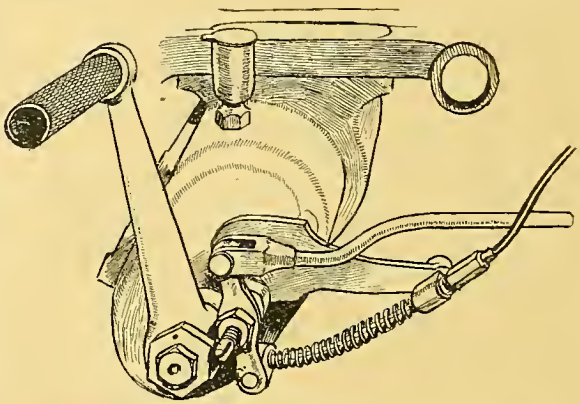
George Hunt, was to start away from rest on the steepest portion of the hill, first on the lowest gear, then on the second, and again on the third. Even this latter performance we carried out with comparative ease, the demonstration providing a most agreeable proof of the efficiency combined with ease of handling of the cork clutch. There was no snatch or jerk, and no tendency to seize; instead, it took up the load gently but surely, gradually increasing its speed.

We suggested to Mr. Hunt that recommending anyone to start on the third gear of a machine by the aid of the clutch was not good policy, in view of the strain it put upon the clutch; but we have his assurance that he regularly does so, and also habitually slips the clutch at corners, and has done so over a mileage of 35,000, and has never suffered from clutch trouble. His unbounded confidence in the efficiency of the clutch is remarkable. Certainly, we have never handled a clutch, whether on a car or a motor cycle, with which such liberties could be taken, and at the end of the trip the clutch took up the drive as sweetly as ever.

Dual Clutch Control.

An interesting fitment, which is new to the Campion, greatly simplified the handling of the machine, and that was an inter-connected pedal and hand lever for operating the clutch. The hand lever is on the left bar, and, consequently, when changing up or down, if the clutch is half eased by the right foot and the exhaust valve lifter touched, a ready and silent change can be effected. Having satisfied ourselves that no treatment, harsh or otherwise, of ours would affect its working in a brief mileage, we turned our particular attention to the balance and pulling of the 1916 model 8 h.p. J.A.P. engine, which, as already mentioned, is a great improvement on any engine of this make which we have tried. We found at speeds ranging from 20 to 40 m.p.h. there was an entire absence of tremor in the handle-bar grip, and there was no suggestion of one's feet dithering on the footplates—an experience not unknown to us.

This experience with the latest V type J.A.P. engine, particularly in the matter of the balancing of the engine, was certainly an eye-opener to us, and demonstrates the degree of comfort to which modern engines are being brought.



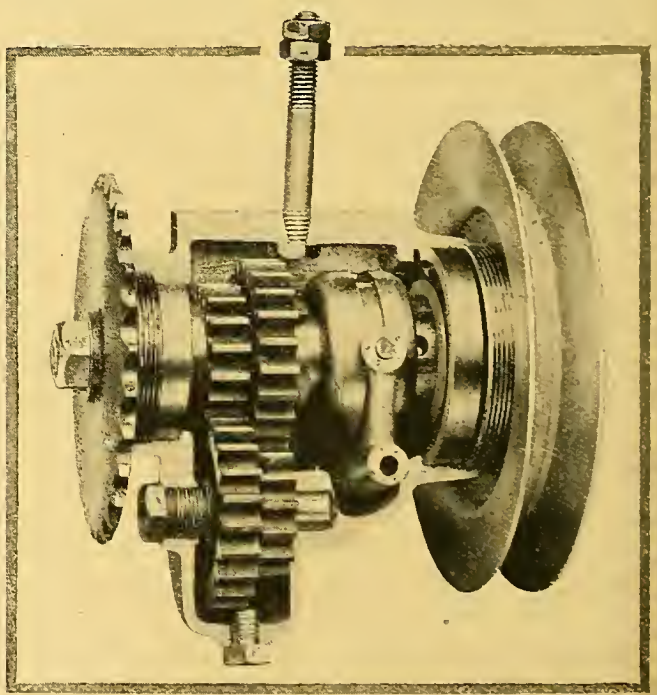
Interconnected hand and foot control for clutch on latest Jardine gear fitted to the new Campion.

JARDINE GEARS IN 1916.

THOUGH outwardly the Jardine four-speed gear remains unaltered for 1916, there are a number of improvements to be noticed from a more detailed inspection of its parts.

First and foremost, the shafts have been strengthened very considerably, and a deep spiral groove cut in the shafts to ensure adequate lubrication. Apart from the ball bearing main shafts, the bearing principle of the gear is now steel on steel, instead of steel on bronze, as formerly used. Each wheel is keyed in position with two keys, and is a ground fit, this change having greatly simplified the operation of assembling and dismantling the gear. Users of the Jardine four-speed gear will be aware of its wonderfully silent running, despite the fact that all wheels are in operation on the lowest speed. One of the secrets of this quiet running is the fact that there is very little difference in the speeds of the wheels, which arrangement also increases its efficiency. The fact that the four-speed Jardine is no more complicated than the three-speed gear, seeing that the two kick starter pinions are merely employed to give an extra low gear ratio, has led to the four-speed box practically superseding the three-speed type of gear. The adjustment provided in the operating gear has lately been simplified, which will overcome the only criticism we have heard of the Jardine four-speed gear. The cork clutch is retained, as it has been found extraordinarily efficient in use, and a 32 plate clutch as a slipping medium for the engine sprocket is now regularly supplied.

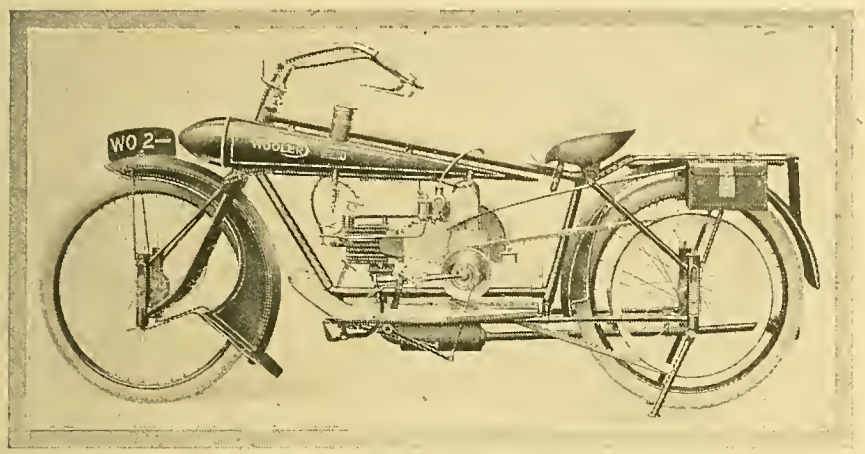
Improvements are noticeable, too, in the two-speed gear intended for lightweight motor cycles. This gear is of the simplest possible construction, and is beautifully made, the whole of the parts, with the exception of the fork (which is a drop forging), being produced in the works of John Jardine, including even the ball bearings on which the shafts run. In this two-speed gear the larger wheel is now screwed on to the smaller wheel, thus reversing the old order of things.



The latest Jardine two-speed gear for lightweight machines, showing its simple construction

The 1916 Wooler Two-stroke.

Some Detail Improvements to a Most Original Design.



Belt side of the latest Wooler, the engine of which is a two-stroke placed horizontally.

ACCOMPANYING are sectional illustrations showing the latest improvements in the Wooler engine. In this interesting two-stroke, which has no crank case compression, there have been no very striking alterations for 1916. It may be remembered that the Wooler has a double-ended piston working in a double-ended cylinder, and the illustration shows how the gudgeon pin and forked connecting rods are designed to work though slots which are always covered by the piston, so that no compression can escape either from the cylinder or the displacer.

One of the improvements is to fit a new detachable oil filter, consisting of a tube of gauze, which prevents any foreign matter from being drawn up into the oil pipe. The pump delivers oil to the cylinder through a drip feed, which can be regulated, the excess being used to lubricate the big ends and main bearings of the engine.

The other improvement is the fitting of a chamber in the transfer pipe, which is shown in the accompanying sketch. This chamber in the transfer pipe is of assistance in the mixing of the charge, reduces the pressure behind the automatic inlet valve, and allows the valve to open slightly later, giving more time for the exhaust gases to escape and thus preventing the incoming mixture being fouled. We are informed that it renders the engine smoother in action, and prolongs the life of the inlet valve. It will be noticed that this chamber, which is fitted with a compression tap, is situated just over the auxiliary inlet port. It may be remembered that the object of the auxiliary inlet port is to enable the inlet pipe to be completely emptied of gas, and this is done as soon as the piston passes the port.

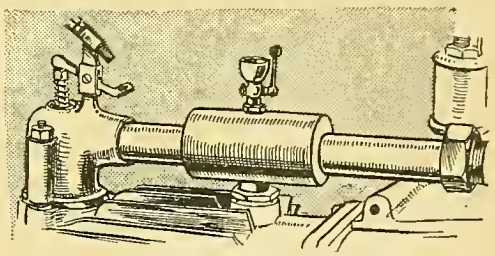
DUBLIN AND DISTRICT M.C.C. MEETING.

THE annual general meeting of the Dublin and District Motor Cycle Club was held on October 28th, at Jury's Hotel, College Green, Mr. G. A. M. Curtis presiding. Satisfactory reports were presented by the hon. secretary and hon. treasurer, the latter's showing an increased balance forward, despite the heavy expenses for prizes in the numerous competitions of the past season. The meeting heard an appeal from J. Dolman, against the decision of the committee in connection with the two days trial to Glengarriff and back, but the decision of the committee was confirmed. New officers for the year 1916 were elected as under: President, Mr. G. A. Curtis (re-elected); hon. sec., Mr. W. H. Freeman; assistant hon. sec., Mr. J. F. A. Day; hon. treasurer, Mr. W. J. Towell; captain, Mr. J. Browne.

The meeting considered the matter of next year's programme, and a resolution was passed recommending the committee to confine next year's events to four, viz., a reliability trial at Easter, the twenty-four hours trial, the two days trial and a meeting at Portmornock, with a possible winter trial on Boxing Day.



The new mixing chamber in the transfer pipe of the 1916 Wooler.

SPEED TRIALS IN SOUTH WALES.

THE Maesteg and District Motor Cycle Club on October 20th held a series of speed tests, the proceeds being devoted to the local Red Cross Funds. The results of the different classes were as follow:

CLASS 1. ANY POWER MACHINE.
1. W. Thomas (4 h.p. Douglas).

CLASS 2. MACHINES UP TO 3 H.P.
1. W. Thomas (2¾ h.p. Douglas).

CLASS 3. SINGLE-CYLINDER MACHINES UP TO 4½ H.P.
1. E. W. Jones (3½ h.p. Triumph).

CLASS 4. TWIN-CYLINDER MACHINES OF 3 H.P. TO 4½ H.P.
1. W. Thomas (4 h.p. Douglas).

CLASS 5. MACHINES EXCEEDING 4½ H.P.
1. W. Bowen (7-9 h.p. Indian).

CLASS 6. SLOW RACE FOR TWIN-CYLINDER MACHINES.
1. T. Thomas (3 h.p. Enfield).

CLASS 7. SLOW RACE FOR SINGLE-CYLINDER MACHINES.
1. —. Lodwig (3½ h.p. New Hudson).

CLASS 8. POLO RACE FOR ANY POWER MACHINE.
1. W. Thomas (4 h.p. Douglas).

W. Thomas (Douglas) won the special prize for the most prizes won.

Motor Cyclists in the Services.

"Owner enlisting" is a reason now frequently given for selling a second-hand machine.

Trend of Design.

There are two V type twin-cylinder two-stroke engines on test in the Midlands, but neither has yet passed the experimental stage, so each designer reports. Newcomers to the pastime do not appear to know that the Rex Co. six or seven years ago produced a V type twin two-stroke engine.

Moneylender and Motor Cycle Dealer.

A letter has been brought to our notice, the heading of which denotes that the writer not only sells motor cycles, but lends money with which to run them. Presumably the idea is to sell a motor cycle to a man, cause him to spend more money than he ought to, and consequently return with the object of borrowing more money with which to run it. The idea strikes us as being distinctly novel. *Caveat emptor!*

A Cumberland Road Warning.

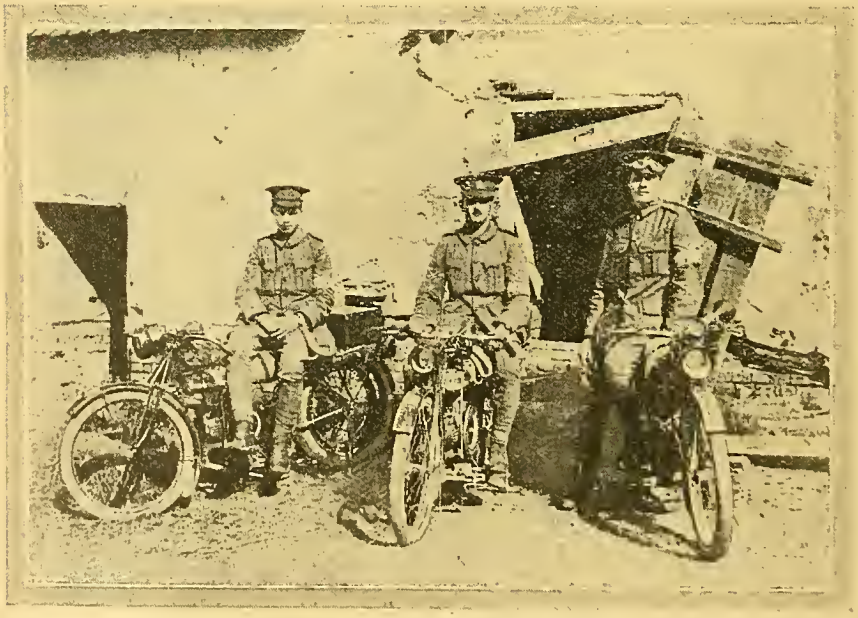
The Automobile Association has received serious complaints regarding the speed of motors through Longtown, Cumberland. At the present time all traffic going North through Carlisle has to pass through Longtown, owing to the closing of the usual road on which a bridge is being rebuilt, as notified some time ago in *The Motor Cycle*.

The Price of Petrol.

It has been said that the price of petrol is lower in England than in any other country except America, but a Dutch correspondent informs us that the prices which have existed there for the last two years, and are the same at the present time, are as follow: Antoline, 1s. 5d. per gallon; Sumatrine, 1s. 2½d. Both these spirits are used for motor cycles and cars, while Carburine, which is used for motor boats only, is 1s. 1½d. per gallon.

Moskovskoye Obschestvo Motoristoff.

The Moscow Motor Cyclists Club has lately been reformed and its sphere extended, and its title is now as above. The M.O.M. will be the recognised headquarters of the sport throughout Russia. It will organise competitions, trials, lectures, etc., and open repair shops and depots. Correspondence is invited from kindred associations in England.



STILL CHEERFUL AFTER FIFTEEN MONTHS' DESPATCH RIDING.

The three men shown have been through the whole campaign in France, being attached to a portion of the Indian Army. The man on the left (Lieut. Metcalf) has been granted a commission since the photograph was taken. All speak highly of their Douglas machines.

Road Repairs.

We have received a letter from the secretary of the Roads Improvement Association in which he points out that, in spite of the Government's action in curtailing the activities of the Road Board, there need be but little deterioration in the road surfaces if the local authorities will face the problem of judicious and skilful patching with proper material on the "stitch in time" principle.

Average Prices.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model, the average for the past week is quoted. If there were not at least two advertisements then the last occasion on which they were quoted is given.

The "B.G." on November 25th.

It is ten years since "*The Motor Cycle* Buyers' Guide" was instituted. This year's Guide, in the absence of a show, is to be illustrated, and will form the feature of our issue of Thursday, November 25th.

Success of British Machines in Canada.

At two recent meetings of the Toronto Motor Cycle Club the Brough has distinguished itself. In a hill-climb on September 27th Broughs were first and second in two classes, *i.e.*, the 4 h.p. and 7 h.p. Again at speed tests on October 11th machines of this make secured three first prizes.

Comforts for the Men at the Front.

Among the many calls for comforts and games for men at the Front—a subject we deal with editorially this week—perhaps the most deserving, from the point of view of the readers of *The Motor Cycle*, is a request from the No. 5 Battery, Motor Machine Gun Section, now on active service. The men in this battery say that two or three Primus stoves, to heat Oxo, milk, etc., in the trenches on cold nights would be a godsend.

R.A.F. Brooklands Meeting.

We have received a letter from the hon. secretary of the Royal Aircraft Factory race meeting at Brooklands, in which he says that not a single protest has been sent in by any of the competitors, which is probably a record. No mention was made of prizes till the meeting was over, and then the committee, finding that they had a little cash in hand, decided to spend about £9 on this object, leaving about £3 or £4 to hand over to the War Distress Fund.

The National Relief Funds.

At the week-end the principal relief funds stood as follow:

	£	s.	d.
Belgian Relief Fund (exceeds)	1,045,000	0	0
Weekly Dispatch Tobacco Fund	87,604	0	0
The Times Fund for the Sick and Wounded ...	1,846,856	0	0
The Queen's Work for Women Fund	166,611	9	11
Daily Mirror Nurse Cavell Memorial Fund	3,500	0	0
Daily Chronicle Fund for Christmas Gifts for the Troops	5,156	0	0

"A Masterpiece of Mechanical Paradox."

We have received several criticisms of Mr. Worsdale's article. A selection of these will appear in our next issue.

A "Wavy" Road

Those Birmingham manufacturers who, following *The Motor Cycle* campaign in favour of spring frames, are studying the question, will find a most excellent stretch of road for testing purposes on the Coventry Road near Hay Mills.

When to Reduce Lights.

Is it not time some means of notice were provided on the outskirts of towns and cities showing the point at which lights must be reduced? Several motorists lately in different parts of the country have overstepped the mark in ignorance, which has later led to their appearance at the local police courts.

What Others Miss!

The Motor Cycle can truly claim to be the only paper covering every phase of the motor cycling movement. Not only are new models described and illustrated as they appear, but important trials all over the kingdom are reported by our correspondents. Readers of this journal have recently had accounts of a coast to coast despatch ride, Scotch petrol consumption trial, a Dutch pillion seat trial, a sidecar outing for wounded soldiers in Cape Town, and different Irish events, etc., etc., the majority of which have been dealt with exclusively in these pages. Four pages of last Thursday's issue were devoted to the R.A.F. munition workers' meeting at Brooklands, which attracted 265 entries.

Our campaign in favour of spring frames has produced such remarkable results that other journals who remained silent while *The Motor Cycle* performed the spade work are having to follow on.

More New Models in This Issue.

This week's issue again contains a number of exclusive features. Among the new models, following upon our description of the 6 h.p. twin Brough, the latest Auto-wheel, and the 6 h.p. twin Vindec, we describe and illustrate three new Campion designs for 1916, the latest horizontal Wooler, and an entirely new three-wheeler design by Mr. Alfred A. Scott. This novel two-seater, which is neither a sidecar nor a cycle car, has a twin-cylinder vertical two-stroke engine, shaft drive, and detachable disc wheels.

The Rain at the Week-end.

The projected Kentish hill-climbing tour for lightweight motor cycles at the week-end did not take place owing to the miserable weather conditions prevailing. Three munition workers braved the elements, two of them having worked all night at Woolwich Arsenal. There was a long wait at the meeting place for the conditions to improve, but as the rain still came down pitilessly the event was abandoned.

A Bogus Lieutenant.

John Arthur Cecil Scott, described as an engineer of Hampstead, had ridden his motor bicycle without lights along Rosslyn Hill after dark at a speed of twenty miles an hour, and a mounted constable had galloped after him for a distance of 600 yards before he overtook him. He gave his name as Lieut. Scott, of the Royal Navy, and refused to give further particulars, and then, lighting up, went off at a fast pace. The police at Hampstead said that Scott had no right to wear the Naval uniform, and had already been dealt with at Marylebone for this offence. On the present summons he was fined £5 or one month's imprisonment.

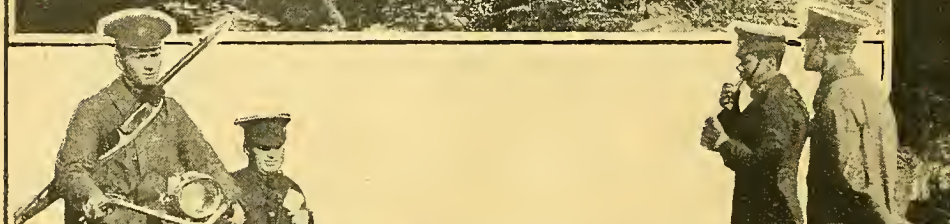
The R.A.C. Reduction of Subscriptions.

At an extraordinary general meeting of the members of the Royal Automobile Club, the Hon. Arthur L. Stanley, M.V.O., M.P., chairman of the Club and president of the Auto Cycle Union, mentioned in his introductory remarks that by retaining the old rates of subscription during the present crisis the Club would run the risk of losing just that class of member which could least easily be spared, and it was most desirable to retain the young, active, and enthusiastic motorist, who could in time to come be relied upon to foster the best interests of the automobile movement.

It was unanimously agreed that the subscription for town members be five guineas, and for country members three guineas. This should result in an influx of many thousands of motorists who had been debarred hitherto from the R.A.C., owing to the comparatively high entrance fee and subscription. It is interesting to note that the entrance fee has been abolished. We are sure that there are many well-to-do motor cyclists, the most enthusiastic of motorists, who will now seize the opportunity of joining the parent body of the A.C.U.

Part of a batch of prospective despatch riders passed by the Editor of *The Motor Cycle* on the 23rd ult. for the Royal Engineers Signal Service. They were tested on their own machines in the Coventry Barracks yard.

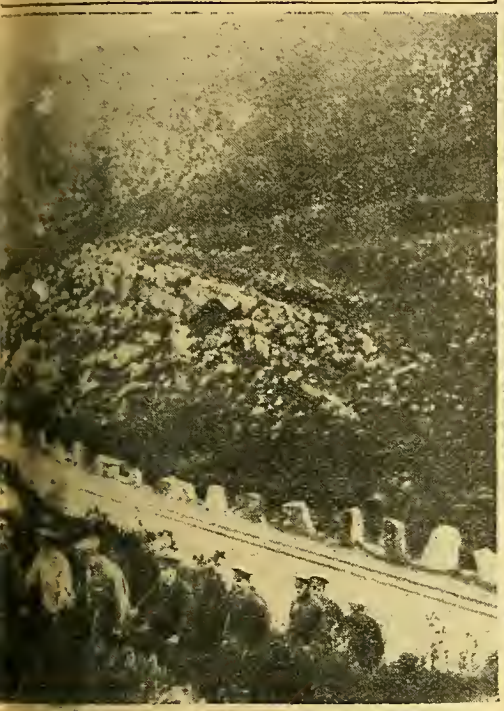
South Afric
Motor Cycle Volu

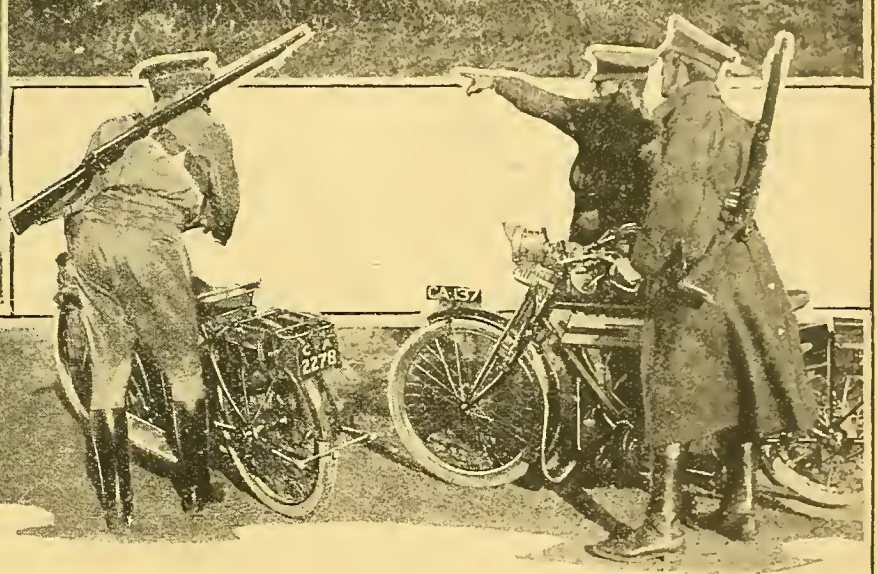


WHAT is more or less the South African equivalent of our motor cycle volunteer corps is the motor cycle troop attached to the Cape Province Training Association. These photographs were taken recently and show Cape Town motor cyclists, who are members of the troop, in training at a week-end camp about forty miles from Cape Town Motor Cycle Troop. The elevated plateau, about 800 feet above sea level, at Smitswinkel Bay. To reach this eminently suitable location a recently opened road has to be followed from Cape Town, and along this proceeds, on Saturday mornings, an advance guard of the Cape Town motor cycle troop. The main body of men follows in

...an ...nteers.

A WEEK-END CAMP OF THE CAPE TOWN TROOP.





the afternoon to find tents pitched and everything prepared by the advance guard.

The surrounding mountains offer opportunities of strenuous training, and, beside motor cycle scouting and other work intimately associated with the motor cycle, the men have rifle practice and infantry training. In this connection it may be mentioned that many of the men, formerly members of this troop, have come home to fight in Europe.

From the illustrations it will be gathered that sidecar machines appear to be as popular for this kind of work as solo machines; they are undoubtedly useful for carrying camp material, etc.

The men look fit and keen, and we wish the Cape Town Motor Cycle Troop every success.

MILITARY NOTES.

NEWS FROM THE FRONT.

WRITING from the Front, Lieutenant Cecil Burney, R.E., tells us that he is very glad to be back again. "The weather," he goes on to say, "is turning very bad now, and the roads are just right for D.R.'s. Bertram Fowke, who used to ride a Blackburne, is out here, but I have not seen him yet. I saw A. Q. Roberts the other day. There are several people out here I have met, or expect to meet shortly, including Rowlandson, Francis (of Lea and Francis), 'Bush' Newsome; in fact, it is quite like Coventry in some ways, with our huge M.T. repair shops here."

SPRING SEAT-PILLARS FOR W.O. MOTOR CYCLES.

IN view of *The Motor Cycle* spring frame campaign, it is worthy of mention that a number of Douglas War Office models on service in France and Flanders have lately been fitted with spring seat-pillars.

A USEFUL WAISTCOAT.

THE cold weather has set in properly in France and Flanders, and Lieut. Philip Grout, in the course of a letter received a few days ago, says he finds his T.T. waistcoat very acceptable. Grout is attached to headquarters with the chief engineer, and says that he is fit and cheerful. He has met S. Garrett, the Regal-Green rider, and now in the A.S.C.

"THE MOTOR CYCLE" 2½d.

THE illustration on this page of Despatch Riders Lander and Thacker was sent us by J. L. Browning, to whose Mechanical Transport column the two riders are attached. Browning says that practically every member of the M.T. units are only too willing to pay the 2½d. demanded by French newsagents for *The Motor Cycle*, which they obtain whilst passing through different towns in the execution of their duties.

SEASONED DESPATCH RIDERS

F. C. Lander (left) and H. L. Thacker, who have been over in France since the very beginning of the war. Both were well-known trade men before the war, Mr. Lander being connected with the British Deperdussin Monoplane Syndicate, and Mr. Thacker with Messrs. Cars and Motor Sundries, Ltd.

BRITISH MOTOR CYCLES FO FRANCE AND EGYPT.

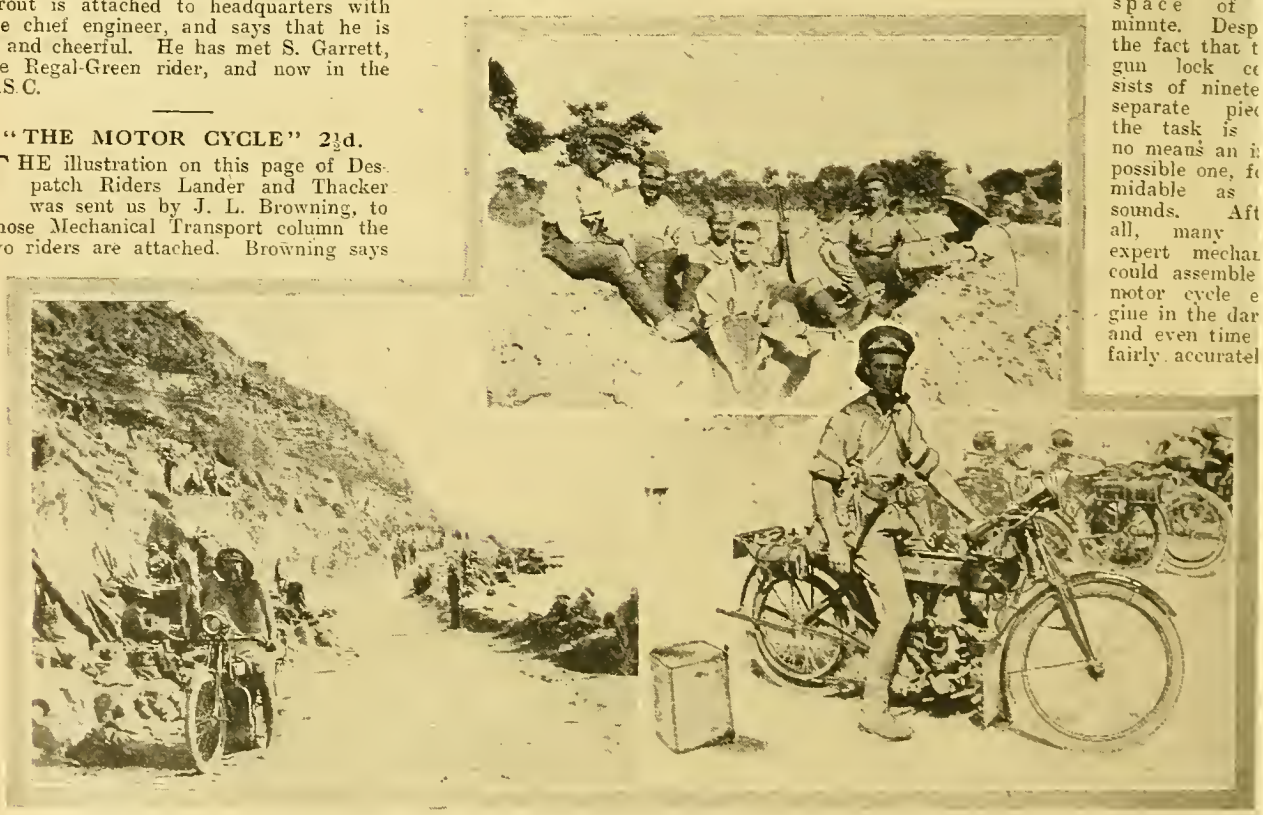
THE Wulfruna Engineering Co. info us that they have just received order for Wolf motor cycles fr the French Government for army use A.B.C. Road Motors have received order to supply motor bicycles to Egyptian Government.

No. 1 BATTERY M.M.G.S

LANCE-CORPL. A. B. WADE (former Zenith rider), who has b on active service for some time, now with the Motor Machine G Section. He tells us that the Sc machines with the No. 1 Battery, which he is attached, are standing bet than one could really hope for. W has met "Scott" Longfield, whom reports in good health, and both are lo ing for the good days and competitic to come.

ASSEMBLING MACHINES BLINDFOLDED.

MEN of the Motor Machine G Service have a very busy ti during training. One of the fi tests a soldier has to pass in the handli of a machine gun is, when blir folded, to build the gun lock in t space of minute. Desp the fact that t gun lock c sists of ninete separate pie the task is no means an i possible one, f midable as sounds. Aft all, many expert mecha could assemble motor cycle e gine in the dar and even time fairly accurate



DESPATCH RIDERS ON THE GALLIPOLI PENINSULA.

Although the use of motor cycles is at present limited on the Gallipoli Peninsula, there are some ready for eventualities. (Top) A group of despatch riders making a dug-out. (Left) A despatch rider coming back from a bathe uses his Douglas. (Right) Corporal Thomas, a Douglas-mounted despatch rider on the Gallipoli Peninsula.

"THE MOTOR CYCLE" RECRUITING SECTION.

Vacancies for Experienced Motor Cyclists in the M.M.G.S.

THE EVOLUTION OF A DESPATCH RIDER.

The upper photographs show prospective despatch riders being tested for mechanical knowledge and riding abilities before being accepted for the R.E. The lower left photograph was taken at a training centre; the back view of the D.R. shows part of his equipment, including the despatch case, while on the left is Sergt.-Major Finnimore, whom most D.R.'s know well. Below, the finished product—riders and their mounts with complete equipment, ready for service overseas.

R.E. DESPATCH RIDERS.

No doubt on account of the Recruiting canvass stirring up eligible men, the number of letters which have been received by the editor from prospective recruits has grown very considerably during the past fortnight. The majority of the applicants seek positions as despatch riders, but, as the South Midland Divisional Area list has swollen considerably during the last week or two, no further applications should be sent to the editor until another appeal is issued.

On Saturday last another examination took place in the Coventry Barracks Square of a score of motor cyclists who desired to enlist in the Royal Flying Corps and the Royal Engineers as despatch riders. Those accepted will be apprised in due course by the authorities.

MOTOR MACHINE GUN SERVICE.

As stated last week a limited number of experienced motor cyclists may now be accepted for the M.M.G.S. without any waiting. Any riders of good physique who have had at least a year's experience and who are desirous of enlisting in this section for the duration of the war should present themselves at the Coventry Recruiting Office on Tuesday afternoon next, the 9th inst., between 2.30 and 4 p.m. The editor of this journal (Mr. Geoffrey Smith), who is inspecting officer, will be in attendance to accept eligible recruits. The M.M.G.S. is the only branch of the Army desiring motor cyclists immediately.

In addition to the vacancies above mentioned, a few experienced car drivers and mechanics who have had experience in motor cycle workshops are wanted.

The undermentioned are among the latest recruits in the M.M.G.S.:

C. Hall.	H. Tillotson.
E. A. Hock.	A. L. Wrate.
J. Kemp.	

Motor cyclists in the Dartford (Kent) divisional area who desire to enlist as despatch riders should apply to the Rev. F. W. Hassard Short, Secretary Motor Cyclist Reserve Committee, 3, Watling Street, Dartford. There are a number of vacancies, and as ten despatch riders have to be furnished every month, it is unlikely that there will be so long a delay in being called up as in the past.

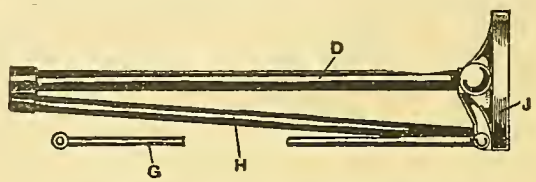
The total number of applications dealt with by the editor of *The Motor Cycle* from motor cyclist recruits totalled 5,064 on Saturday last.

A Scott Three-wheeler Design.

Sidecar or Cycle Car? Novelty Throughout in the True Sense of the Word.

THERE has just been published an interesting patent specification in the name of A. A. Scott, the designer of the well-known two stroke motor bicycle, which gives details of a new design of three-wheeled vehicle. This provides for the carrying of two occupants side by side in a comfortably low position, with considerable capacity for luggage, etc.

At first glance it resembles somewhat a sidecar outfit, but the high vertical frame of the motor bicycle has gone, and in its place is a low tubular structure of



Detail end view of axle showing stiffening strut H.

considerable strength. It will also be noticed that all the wheels are of the "overhung" type. That is to say, there are no forks as used on motor bicycles, the wheels being carried as on motor cars, so that each is easily detachable, and the same applies to its tyres. Another extremely important point is that all the tubular frame members are straight, and the machine is built up of a series of triangular structures of considerable strength. All the tubes are relieved from bending stresses, and are subject only to stresses of compression and tension, and the loads are all supported at the junction of the triangular structures.

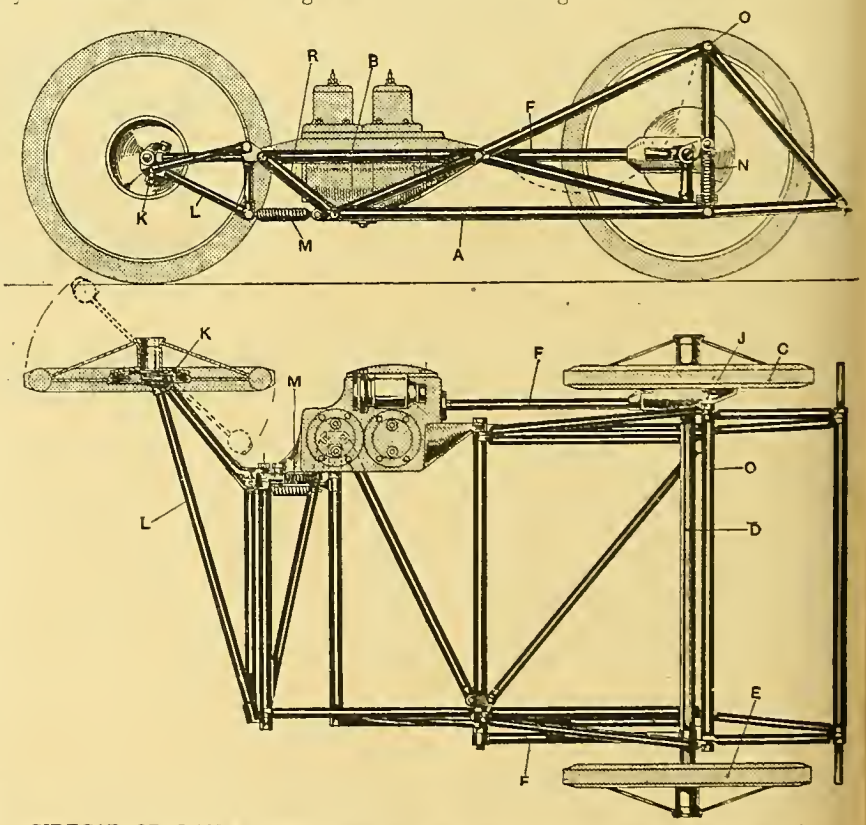
Interesting Frame Design.

In side elevation the frame is seen to comprise two parallel tubes, A and B in the reproduced specification, joined together by angular tubes, so that on the left-hand side two triangular structures are formed of which the members A and B form the bases. On the right-hand side of the frame the smaller triangle is constituted by the engine crank case casting; the two side frames are connected together by straight cross members, and also by diagonal tubes. It is claimed that the engine is prevented from setting up any oscillation on the frame by this method of attachment. The engine drives by a flexible propeller-shaft to the right-hand rear wheel C. This is mounted upon a fixed back axle D, as also is the left-hand wheel E. The axle is connected with the frame and engine by radius rods F, of which the right-hand one contains the propeller-shaft. The axle is also connected laterally with the frame by a transverse radius rod G. As will be seen from the detail end view, the back axle D is stiffened by a strut H, which is connected at one end with the axle and at the other end with the casing J which contains the bevel or other driving gear at the rear end of the propeller-shaft.

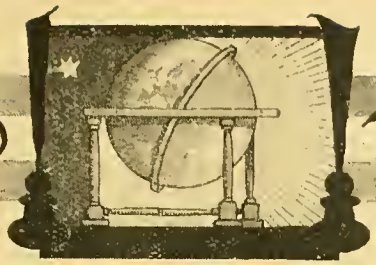
The front wheel swivels about a steering pivot K such as is used on motor cars, and this is supported by a structure L which is triangular both in plan and side elevation. This is pivoted to both sides of the front of the main frame, so that considerable support is afforded. The pivoted front structure L is connected with the main frame by springs M, and the back axle is coupled to the main frame by similar springs N. The main frame is therefore underslung at the back.

There is also a frame extension behind the axle which forms a luggage carrier, and there is a triangular structure supporting the cross member O, from which, as shown in dotted lines, a hammock type of seat can be slung. The footboard is arranged along the member R, so that it will be clear that both occupants are arranged very low down and side by side.

A machine on these lines, with Scott patent disc wheels, has already received exhaustive tests on the road, but until it has passed the experimental stage Mr. Alfred Scott is, perhaps, naturally averse to a full description of the machine appearing. As an attempt to produce a simple and light two-seater, this new design is bound to create great interest.



SIDECAR OR CYCLE CAR? Side and plan views of a new three-wheeler design by Mr. Alfred A. Scott. The engine is a twin-cylinder vertical two-stroke.



LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address

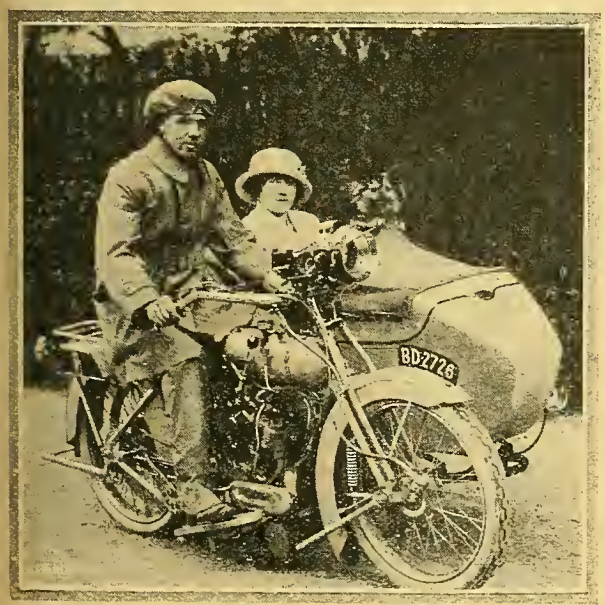
The Modern Sidecar Outfit Compared.

Sir,—I quite agree that there is no question of new engines being inferior to the models of a few years ago. All I suggest is that the new 3½ h.p. outfit, though admittedly more luxurious, is considerably slower than its forerunner of three years ago, both on the level and when climbing. It appears now to be designed for the middle-aged potterer possessed of a wife who insists on having an ostentatious sidecar, and the result is that those who still want speed must either cling to their old mount or run a big twin. The average modern 3½ h.p. combination is too heavy, too complicated, and too luxurious for speed. Till I can get a big twin, I shall stick to my old Bradbury and its shabby sidecar. As for Mr. Davies's B.S.A., it is as much as I can do to keep my three-year old under control when it spots the familiar green tank ahead. Mr. Davies would not have a chance. E. C. PALMER.

Sir,—Surely Mr. E. C. Palmer, in his letter in *The Motor Cycle* of the 14th inst., makes a rather big claim respecting the alleged superiority of his 1912 4 h.p. over the present 3½ and 4 h.p. I have no wish to belittle the performances of his machine, and I also am a believer in the old saw, "Old friends are truest," but I certainly must challenge the statements. I consider I am an average rider, and for the past seven months have driven a 1915 3½ h.p. Sunbeam single.

Now, I have successfully tackled most of the worst hills in Sussex, and with a sidecar and passengers ranging from ten to fourteen stone have never dropped lower than second, with the exception of, say, really bad corners or for some obstruction. All ordinary gradients have been mounted on top gear, and, in spite of that, the petrol consumption, tested carefully with an average 22 stone load, has been 82 m.p.g. The tyres are still in good order after over 6,000 miles, and the chains in perfect condition for the mileage.

I have no interest in the cycle mentioned, and write this only as a satisfied user. Anyway, a chat with "E.C.P." would be interesting, but as he has the pull over me of half a horse-power I had better not challenge him on a 1 in 5 with a head wind. A SUSSEX SUNBEAM.



Mr. and Mrs. Harry Green, of Rushden, Northants, and their 1915 6 h.p. Bat-Canoelet sidecar machine. The Pomeranian is a keen sidecarist—simply won't be left at home, and has already covered 2,500 miles.

Footballs for the Front.

Sir,—I notice an appeal for footballs in your issue of the 21st ult. Will you please allow me space to point out to those who are likely to respond that the boys in or near the firing line are those to whom footballs, etc., should be sent?

Red Cross and other mechanics are paid sufficient wages to provide them for themselves, and ought not to be encouraged to beg of the good-natured people at home.
M. J. HAWKINS.

Condition of Main Roads in Kent.

Sir,—With reference to your road reports of main roads in Kent in *The Motor Cycle* of October 7th, I feel that the paragraph regarding the main road from Gravesend to Chatham is rather misleading. I quite agree that the surface of this particular highway was very rough some weeks ago; but, in my opinion, it is now improved to a great extent, and, as I use this road every day, through all weathers, I can safely speak from experience. There are now only one or two very short patches which could be classed as faulty.
W. W. PINK.

Semi-T.T. Handle-bars.

Sir—It is with great pleasure that I always read your interesting journal, and especially "Ixion's" effort. In your issue of August 12th he writes a very caustic note on the subject of standard handle-bars, and here he has my fullest support. Often after a bad skid I vented my anger on the handle-bars by putting one foot against one and tugging at the other. Needless to say, I never budged them until I scrapped them in favour of a pair of semi-T.T. handles. Then only did I feel safe in mud and sand, which out here is often 6in. deep and extending for from 50 to 200 yards in patches. G.L.K.

Potchefstroom, Transvaal, S.A.

The Lady Motor Cyclist: A Protest.

Sir.—Considerable prominence has been given recently, in the motor cycle press, to the subject of motor cyclists of the fair sex, and the machines they ride.

It must be obvious from some of the photographs published, that there exists some difficulty in obtaining, or disinclination to use, machines which are especially constructed for ladies' use. Presuming this to be correct, I think all who have an interest in the sport and pastime must view this state of affairs with some alarm. I plead "not guilty" to being a prude, but do consider a woman loses her self-respect and the respect of all right-thinking people by some of the exhibitions which of recent years, and more especially recent months, have been thrust before the gaze of the public. I daresay no one, of the male sex, has taken more interest in motor cycling for ladies than I have, and some of my happiest hours, during many years' experience of the pastime, have been spent with clubs which encouraged lady riders who rode ladies' machines.
B.E.F. THE DREADNOUGHT.

Two Independent Brakes.

Sir,—A warning to Harley-Davidson riders. Whilst riding through Garstang on Sunday I was stopped by a policeman, and he enquired if I had two independent brakes. Not knowing the rules, and relying on the machine being complete, I pleaded ignorance, but was reported and fined 10s. I thought I would write you for the benefit of your readers.

A. V. GRIMSHAW.

[In connection with the above, it should be mentioned that the latest Harley-Davidson machines have two independent brakes.—ED.]

Clergymen and the Petrol Tax.

Sir,—I certainly agree with "Ixion" that there are many minor professional users of motor vehicles who are more entitled to consideration *re* rebate of petrol duty than the clerical profession; in fact, I think the latter could make out but a very poor case. These "minor professionals" are generally persons of no greater means, but compelled to a much greater extent to rely on motor propulsion for the rapid and economical performance of their business, and hence the petrol tax bears more hardly on them.

There is, however, very little likelihood of any extension of the rebate system: even the present rebates cause so much trouble and expense that any extension of the system would make any but a high rate tax unprofitable. Even under the present system claims are made on account of doctors' cars, hired-out motors, trade vans, threshing engines, chaff cutters, mangel-wurzel choppers, house lighting, and even travelling ice cream carts (a thermal contrast surely!)

Personally, I cannot see even why doctors should be entitled to rebate any more than the numerous body of "minor professionals" who are users (often compulsorily) of motor vehicles for business purposes. Doctors, as a rule, are certainly as well able to afford the tax as the latter class, and are equally interested in the proper upkeep of the roads. Being a Customs and Excise Officer, however, and having to pay the full tax on all petrol used (even that used in connection with the investigation of these very rebate claims), I am probably biassed on the subject.

CUSTEX.

Engine Rattle in Two-strokes.

Sir,—I have read with interest the article on "Engine Rattle in Two-strokes" by "Oile" in your issue of the 7th inst. I own a 2½ h.p. two-stroke Connaught, and have had the same experience as "Oile," with the exception that the rattle has not yet ceased, neither can I find out the cause. The rattle commenced about two months after I purchased the machine, which is now five months old. When I approach 25-28 m.p.h. the rattle commences, and when I throttle down gradually dies away until a high speed is again attained. I do not find it, however, when the machine is going up hill. I have tried cleaning out the cylinder, fitted new piston rings and plugs without benefit, and I should like to know if any other reader has had a similar experience; if so, whether a remedy has been found?

W.G.E.

Sir,—There is no doubt that the rattle complained of has a cause and also a remedy, but I do not consider it common to two-strokes. It points to faulty carburation or ignition, or both, and these can be got over. My machine is bad for four-stroking at slow speeds or starting, but runs well at anything over 10 m.p.h.

May I give my experience? I bought a 2½-3 h.p. 1914 two-stroke, petroil system, two months ago, and from its appearance it had done some mileage. I overhauled it, cleaned piston and cylinder, brought up the compression, and found all in excellent order. I covered some 350 to 400 miles on it, mainly by twenty-mile runs, but recently decided to go from London to Yorkshire—a day for each way. My outward run was covered at an average speed of 23 m.p.h.; the engine ran grandly, and only once did I have signs of overheating. I climbed all hills on top (5 to 1), although fitted with a three-speed gear. On the return journey I carefully checked the petrol in tank at start and finish, and found the consumption just 1¾ gallons of No. 2 for 220 miles; this is 125.7 miles per gallon—nothing much to complain of—and my average speed worked out at 24 m.p.h.. The engine ran splendidly, and again only had signs of overheating once (at Stamford), no rattle whatever, and between towns ran with wide open throttle.

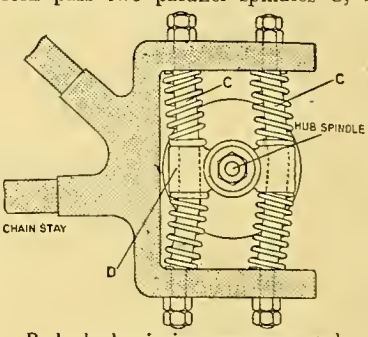
I have Amac, 24 jet, gauze on intake and between carburetter and cylinder, petrol $\frac{3}{16}$in. below jet. I paid attention to air slide to see it opened wide, re-timed magneto, and set it well in advance, but always retard when engine speed falls. The acceleration on opening throttle wide is splendid, without a trace of knock, but I usually open slowly. However, on this trip I took all hills slowly, say 20 m.p.h. to start, and eased up on down grades to give the engine a chance to cool, but drove hard on the level, doing one stretch of nine miles in 15½m. by stop-watch.

My experience thus shows that there are two-strokes which run well, and mine is far from new, though in good condition. The mileage I have covered is about 800, and not once has the engine knocked, and only three or four times has it overheated, and 300 to 400 yards at 12 to 15 m.p.h. have cured it.

WIMBLEDON.

Rear Springing.

Sir,—I enclose sketch of a suggested form of rear springing, or rather back wheel springing. At the rear end of the chain stay and diagonal stay is a large one-piece bracket in the form of a fork. Through the parallel arms of the fork pass two parallel spindles C, slightly curved to form an arc, and secured on the outside of the fork at both ends by lock nuts. Sliding on these spindles is a sleeve D, through the centre of which passes the hub spindle, the latter being of the "knock out" type in order to overcome any difficulties about back wheel removal. Above and below this sleeve, mounted on the spindles, are four stout coil springs.



Back wheel springing system suggested by Sec.-Lieut. W. Austin N. Smith.

It will be seen that the back wheel would have an upward or downward motion, governed by these coil springs, the same arrangement being, of course, on either side of the wheel; the necessary radial motion of the wheel is given by the fact that the spindles C are slightly curved. What seems to me to be a great advantage of this idea is that there would be an absolute minimum of unsprung weight. It should also be fairly rigid laterally, and the shorter and stouter the spindles are, the more this would be the case. It might be made a stiffer job by having the bracket in the form of a rectangle instead of a fork; however, this would hardly be necessary. It seems to me that something after this type might, at any rate, be applicable to light-weight machines, if not to those of the heavier type, and it should be fairly inexpensive to produce.

W. AUSTIN N. SMITH (SEC.-LIEUT.).

Paraffin Motor Cycle Lamps.

Sir,—Your correspondent, Mr. P. W. Johnson, asks about paraffin lamps. Let me strongly advise him, from personal experience, to give up the idea. I had two of the best lamps made a couple of years ago, and they blew out every few yards—literally. A large Holborn firm made a lamp at that time specially for sidecar use, but gave it up. It is not the jolting that causes the trouble so much as the excessive draught, and no arrangement of blocking holes that either the makers or I could try cured it.

EL 1969.

THE MOTOR CYCLE

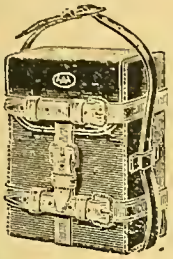
BUYERS' GUIDE OF 1916 MODELS.

THURSDAY, NOVEMBER 25th!

This issue will be considerably enlarged and will contain an illustrated review of the various new pattern motor cycles.

INDISPENSABLE ACCESSORIES.

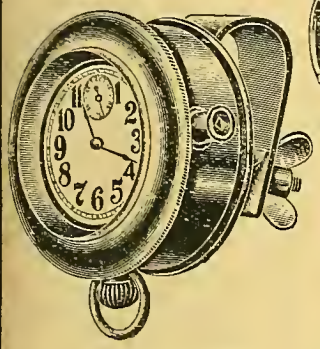
Flash Battery.
"Flash,"
size 6½ × 4½ × 2½in.
Price .. 8/2



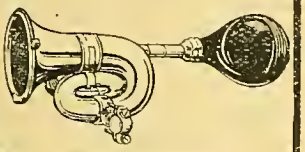
Leather Case for Flash Cell Battery.
In leather, 7/2
In fibre, 3/10

Gre-Solvent.
Perfect Hand Cleaner
6 oz. tin, 3d.

M.C. WATCH.



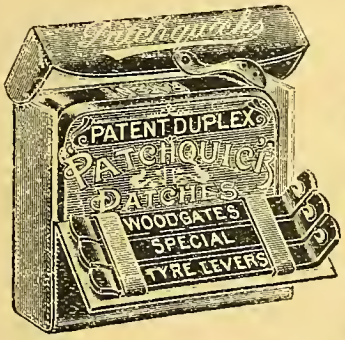
An excellent watch with lock.
30-hour, **11/-**
Best quality 8-day, **33/-**



Nickel-plated Horn,
with gauze, with a fine powerful note, **15/6**

QUICK-DRYING BLACK.
For rusty or dirty cylinders.
1/2 per tin.

A very hard invisible lacquer for plated parts of cycle or lamps. Invaluable for winter riding. **10d.** per tin.



PATCHQUICK M.C. WALLET.
Leather wallet, complete with the Patchquick Repair Outfit and three tyre levers.
Price complete .. **6/9**
All Patchquick Tyre Outfits Stocked.

Dunhills

Illustrated Catalogue post free.

359-361, Euston Road, London, N.W.
42-43, Lombard Street, London, E.C.
72, St. Vincent St., Glasgow. **90-92, Cross St., Manchester.**

Price complete
49/- Plus 15%
with 6 spare jets, key, and full instructions.
SENT ON APPROVAL AND TRIAL.
FOR SCOTT MACHINES
SPECIAL FITTINGS ARE REQUIRED
15/- extra complete.
Can be put on in an hour

All my carburetters are quite automatic, but an extra air lever is fitted, by means of which extra air can be admitted any time or when running downhill with the throttle closed.

I AM ADVISING YOU

IF YOU WILL ACCEPT MY ADVICE YOU WILL

BEWARE OF IMITATORS.

As you will remember two of my competitors have in the past strongly advised that **pilot** jets were not necessary. Now they are fitting their latest productions with them, as they have at last recognised that they are really essential, but this is the important point for **you** to remember: they have copied obsolete designs of mine that I have **abandoned two years ago** in favour of something **much** better. The **BINKS Jet-Damping Carburetter** is patent, and **may not be copied**, and is the last word in carburetter construction. It makes your engine really flexible, and allows it to tick over like a clock when idle and won't race when the clutch is taken out, and on a 3½ Single you can do over **150 miles to the gallon** (see *The Motor Cycle*).

WHY NOT GREATLY IMPROVE YOUR MACHINE BY GETTING ONE TO-DAY?

I send them on a **week's approval**, and return your money, less examination fee, if you are not in every way highly satisfied. These carburetters have caused a **profound** impression, as they really do what no other carburetter can do by reason of their construction. The testimonials I have received are almost embarrassing, and I invite you to send for my testimonial book.

Mr. Robbins, using this carburetter, has won the much-coveted "Manufacturers' Trophy." What higher testimony can be suggested for touring value?

Mr. O'Donovan astonished the world by travelling at over 81 miles per hour on a 3½ Single Norton; no other carburetter would give an equal speed. No matter what make of machine you have, a BINKS will fit and improve it and give you just what you so desire.

ON THE SCOTT. Well, the improvement has to be seen to be believed. With a BINKS carburetter the Scott engine will tick over dead slow when in free and start with one kick.

PETROL

SUBSTITUTE

1/- PER GALLON.

ALL USERS OR PURCHASERS OF MY CARBURETTERS WILL BE ABLE TO BUY THIS WONDERFUL SPIRIT, WHICH IS INDISTINGUISHABLE FROM PETROL AT DOUBLE THE PRICE, ENABLING YOU TO RUN YOUR MACHINE AT HALF COST. WRITE FOR PARTICULARS.

C. BINKS Ltd., Phœnix Works. ECCLES, Manchester.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Fitting a Magneto Switch.

I should be obliged if you would let me know if it is possible to fix a magneto cut-out switch to a two-stroke motor cycle, the magneto being a Dixie, and, if so, the best way to set about it.—H.L.G.

There is no difficulty whatever about fitting a magneto switch if you desire to do so. All you have to do is to connect a wire from the terminal on the magneto contact breaker to a switch on the handle-bars. If there is no terminal on the magneto you must write to the makers of the magneto for one.

Electric Lighting by Accumulator.

Do you consider that accumulators are satisfactory for lighting purposes on a motor cycle for head and tail lamp?—A.E.L.

A good accumulator is perfectly satisfactory—see *The Motor Cycle*, April 29th, page 412. The accumulator there referred to has had but one recharge in twelve months. We advise you to get one of 40 ampère hours and to use bulbs which do not require a large discharge, say, .75 ampère for head light and .25 ampère for tail lamp. These will give you ample light if your lamp is a good one and correctly focussed.

Lubrication.

I have a 2¼ h.p. two-stroke, and I wish to know if one may instead of keeping them separate, use petrol and oil combined. If so, what is the proportion of oil to petrol? Unfortunately, the makers do not send the machines out with a sight feed, and in cold weather it is somewhat difficult to know the amount of oil being supplied to the engine.—G.W.

We should recommend you to have a sight feed arranged, so that you can see how fast the oil is going through, in preference to mixing oil with the petrol, which, though satisfactory from the lubrication point of view, is exceedingly messy, as the mixture leaves traces of oil wherever it leaks. The correct proportion is half a pint of oil to a gallon of petrol.

Paraffin as a Fuel.

I have a 3½ h.p. Triumph, and, owing to petrol being so dear, I have been experimenting with best paraffin at 11d. per gallon, and find it works fairly well. Now some of my friends tell me that paraffin is injurious to the engine, etc. I shall be grateful if you will state if this fuel is at all detrimental, and if you would advise me to continue using it or not.—T.D.

Paraffin causes sooting in the engine, and also konking through pre-ignition, and, of course, the latter is always detrimental to the bearings. You will be quite safe in using three parts petrol and one paraffin, provided the engine does not knock.

Fitting a Larger Belt.

I am thinking of fitting a larger size belt on my machine; the present one is a ¾in., and it has bedded down to the bottom of the pulley after about 500 miles, so I thought of fitting a ⅞in. belt. Is there any disadvantage in doing this? The pulley is not worn, neither has any rubber peeled off the belt. The machine is a new one. I understand it will raise the gear a little, but my weight is not much—about nine stone—and I hardly ever use more than half throttle. Do you recommend this alteration of belt?—A.L.

If the belt is really a good fit on the pulley, and does not project too much above it, there is no reason why you should not use a larger belt; in fact, this would be a considerable improvement. It might raise the gear a little, but this would not matter.

Annual Buyers' Guide
OF
THE MOTOR CYCLE
An Invaluable Work of Reference.
This year's Guide will appear in our issue of THURSDAY, Nov. 25th, and illustrations of 1916 Models will form a feature.

Silencer Explosions.

(1.) My motor cycle is sometimes most difficult to start with the kick starter. After three or four kicks it misfires with a bad explosion. Does this harm the engine? (2.) I also want to know the best method of unscrewing a tight nut. The one in question is a small nut on the crank case which holds the bracket of the gear case.—G.H.

(1.) Probably the mixture is rather too weak. At starting the air should be closed and the carburetter flooded. If you use the kick starter several times and the engine does not fire, unexploded charges get into the silencer, so the next time the engine fires one of these is exploded, and this causes the loud noise. It does not do any harm to the engine, but it might possibly blow out the end of the silencer. You might try the effect of a slightly larger jet. (2.) Get a box spanner, or a spanner that exactly fits, which has a long handle to it, and tap it with a hammer. You will then have no difficulty in removing the nut. If you use force with a small bad-fitting spanner you will only burr the nut over.

Carburetter Adjustment.

(1.) Should I be able to run with the air fully open? At present after about seven miles with much air the engine begins to misfire; what causes this? I have an Amac carburetter, 26 jet. Should I try 24 jet? (2.) With Enfield gear 6 to 1, 13 to 1, can I raise the top gear to 4¾ to 1 without altering lower gear? Please explain the method, and would this give higher speed?—I.J.F.

(1.) The trouble is possibly due to a slight obstruction in the jet. Normally, if the carburetter is correctly adjusted, you should be able to run on full air. Of course, a change in temperature might also necessitate running on less air. We do not think a smaller jet would be an improvement. (2.) Yes, you can raise the top gear without altering the low by fitting a larger engine sprocket, as the two gears are separate, there being a separate chain for each. This might give greater speed, but you would not climb so well on top gear.

Changing Gear.

I own an 8 h.p. Williamson combination, fitted with two-speed and free engine, and also pedal-operated friction clutch. (1.) On ascending a steep hill with heavy load, to change down to low gear, what is the correct method—use the clutch or exhaust lifter? (2.) To change back to high gear—use the clutch or exhaust lifter? (3.) Is it advisable to use the clutch to free the engine in order either to stop the machine, not engine, or slow down, say, when meeting a flock of sheep or other obstruction; or is it only intended for starting purposes? (4.) Is the clutch intended to assist you in negotiating traffic by being slipped when you want to stop or slow up without stopping the engine? (5.) Should the neutral position of gears be used at all in driving, or is it only intended for starting purposes and wheeling the machine about?—G.E.H.

(1.) Use the clutch, or change without touching either lever. (2.) Here you may use either method. If you withdraw the clutch, close the throttle right down while the actual change is being effected, so as to take the load off the transmission. The use of the clutch for changing would probably give a quieter and sweeter change. (3.) The clutch could be used to stop the machine, provided you throttle down at the same time, or when you are negotiating traffic. (4.) Certainly the clutch is intended to help you to negotiate traffic, but it should not be slipped unduly, otherwise there may be trouble. (5.) The neutral position must not be used except for starting purposes or when pushing the machine about.

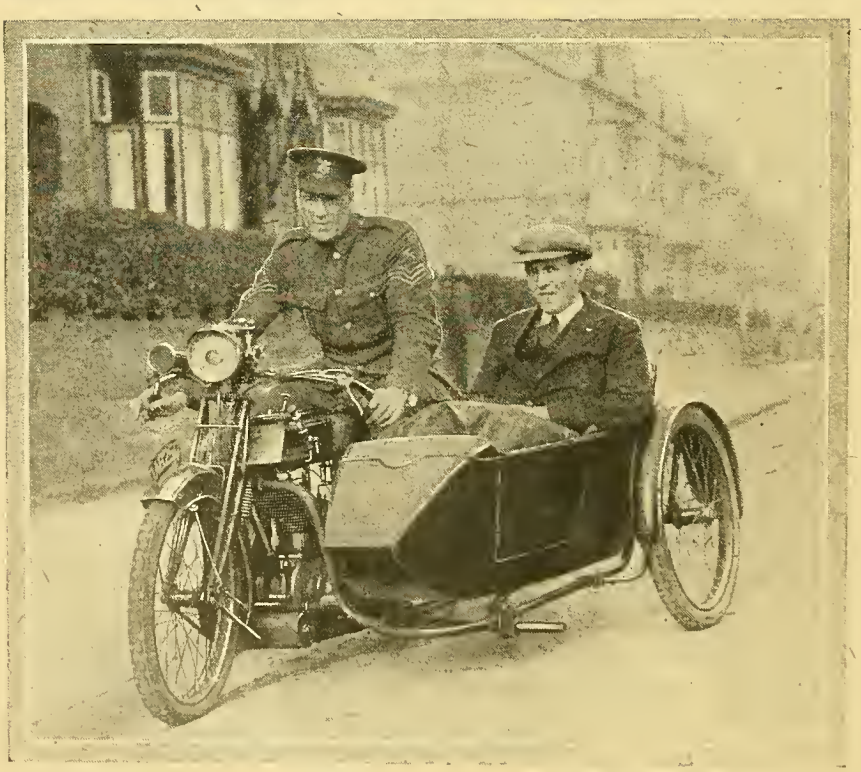
Automatic Inlet Valve Cotter Breaking.

I have a 1¾ h.p. Minerva, and have considerable trouble with the automatic inlet valve, which breaks the cotter-pin constantly in the hole, after travelling a distance of from fifteen to twenty miles. Can you kindly explain the reason for this, and give a remedy?—E.A.N.

You may cure the trouble by fitting a washer over the valve collar. This would have the effect of reducing the lift, consequently the valve will not have so much opportunity for chattering, and the risk of breakage would be minimised. The lift should be about 3/32nds of an inch. See article on "Valve Stresses," published on June 3rd.

READER'S REPLY.

With reference to a letter signed "W.McK." in *The Motor Cycle* of October 21st, I think his trouble of difficult starting and erratic running when cold may be due to the same trouble as I have just experienced on my 3½ h.p. twin with Amac carburetter. My symptoms were as follow: When starting from cold I flooded the carburetter till petrol overflowed, and the engine would then fire in both cylinders for about five revolutions, and then stop dead. I would then push off again, and the same thing would happen. This would go on for about eight starts, when finally the engine would keep running, but missing very badly and occasionally blowing back through the carburetter; after about half a minute of this, the firing would gradually become better, and finally become regular. In addition to this trouble, when on the road, without touching throttle, the engine would sometimes slightly accelerate, and then slow, then accelerate again, and so on. The variations were only slight, but perceptible. On taking down the carburetter I found that petrol overflowed from the jet steadily for no apparent cause, such as needle not seating properly. I then happened to notice that the cap which holds the flooder and spring just touched the top of the needle when the cap was screwed down tight on the top of the float chamber. Removing the cap caused the engine to run perfectly. Perhaps this may be the cause of "W.McK.'s" trouble, or, at any rate, it may be of use to other riders to know that this is a likely cause of irregular working.—D.L.E.



Sergt. (late Bombardier) Wells, heavyweight champion of England, off for a spin on a 1915 Sunbeam.

EXPERIENCES WANTED.

"F.W.W." (Mayo), "C.B." (Gosport), and "F.G.H." (Woolwich). — Douglas carburetter fitted with a Badcock by-pass. Ease of starting and even firing at slow speeds.

"N.C." (Runcorn).—3½ h.p. A.B.C. (touring model). Reliability, consumption, speed, and hill-climbing, solo and with sidecar.

"J.B.J." (Ayrsbire).—3½ h.p. A.B.C. (touring model) and 3½ h.p. Norton (all chain drive). Consumption, reliability, and all-round efficiency.

"R.H." (Andover).—2¾ h.p. two-speed Douglas with light sidecar. Hill-climbing, reliability, and consumption.

"J.B.I.M." (Newmarket). — 3½ h.p. A.B.C. Cost of upkeep, consumption, reliability, and suitability for use in the bush, West Africa.

RECOMMENDED ROUTES.

WALKEN (MANCHESTER) TO BISHOP AUCKLAND.—F.E.

Walken, Bury, Accrington, Burnley, Colne, Skipton, Harrogate, Ripley, Ripon, Leeming, Scotch Corner, Piercebridge, West Auckland, Bishop Auckland.

SOUTHAMPTON TO HOLYHEAD.—C.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed ——— & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

A New Series of Cycle Cars.

THE sidecar, the most maligned type of motor vehicle on the road, and generally judged to be the most unmechanical in point of view of design, has, if anything, "made good" quicker than any other type of vehicle produced in the motoring era. Introduced as a lightweight in the same manner as practically every other type of motor vehicle, it has gradually grown in power and luxuriousness, and by reason of added weight has been strengthened, so that it is now as reliable a piece of mechanism as it is possible to imagine.

And so, having proved its worth, both in the hands of the pleasure user and the trade, and last, but not least, in the requirements of the Army, designers have latterly turned their attention to modifications of the sidecar outfit, such as the fitting of a two-seated body, so that both driver and passenger shall be protected from the elements. As a matter of fact, the sidecar is so cheap to buy, so economical to run, and so absolutely reliable, as well as being fast, not only on the level, but uphill, that its numbers would have been trebled had it not possessed that inherent weakness of an exposed position for the driver. Hitherto the double-seated sidecars, which have merely dispensed with the driver's saddle, have not attracted the public in large numbers; but, nevertheless, the demand for something of the kind has been abundantly evident for years past, and particularly since untested cycle cars were hastily rushed on to the market in their experimental state and were heralded by false prophets as the last word in two-seaters—not, however, in *The Motor Cycle*. Left to mature with reasonable encouragement, the cycle car might have been a success to-day. Instead, it was accorded a degree of prominence wholly undeserved—and entirely failed to come up to expectations.

Last week we illustrated and described the latest production of a designer whose name is a household word in motor cycle circles, and in this design, whilst the general outlines of the sidecar have been retained, the diamond frame of the bicycle has been discarded. Instead, the vehicle has been built as a permanent three-wheeler. This is as it should be. If the heavy coach-built sidecar outfit has come to stay—and there is no doubt on that score—then makeshift methods of attachment are not sufficient.

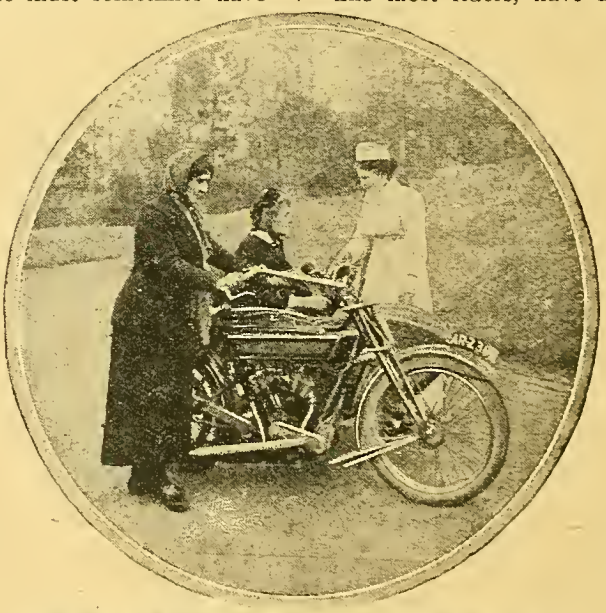
We are glad that one engineer, at any rate, convinced of the success of the sidecar as a type, has set about designing a vehicle on similar lines, which is intended to be a permanent two-seater instead of a vehicle in two separate sections, so to speak. In this manner it has been found possible to improve upon many features which have been open to criticism in the past. A weatherproof shaft drive, for instance, has been incorporated, and it is possible to co-ordinate the frame design, by which we mean that, no matter how strong the bicycle or the sidecar frame of an ordinary type of machine may be as separate units, the idea of their attachment is not sound. Again, the wheels not being carried in fork ends are readily detachable and interchangeable. One excellent feature of the sidecar type of three-wheeler is its wonderful mobility and the great ease with which it may be turned in either direction in the space of a narrow road. It is thus possible to dispense with the complication of a reverse gear, and so simplify driving from the novice's point of view. It was only the old pattern light sidecars with a narrow track which gave trouble on this score.

We hail with considerable satisfaction the arrival of this very original design—the commencement of a new series of cycle cars—as there is no doubt that sidecar makers have got into a groove, yet the call for a weatherproof two-seater has been and is insistent, and the possibilities of such an outfit as a result of the failure of the belt driven four-wheeled cycle car are doubled.

An Index to the advertisements in this issue will be found on the page facing the back cover.

THE DEVELOPMENT OF THE MOTOR CYCLIST. A SIDECAR SCREEN.

IT is most interesting to watch the development of the motor cycling habit in the beginner. The way in which the sport captures the enthusiasms of everyone who tries a venture is surprising to those people who have yet to try their hand on the driving and management of a motor cycle of their own. Passing my window several times each week, probably on her way to town, is a rider who has recently acquired a new lady's Douglas. Some three years ago this same rider piloted an old tricar, with no passenger, up and down the same highway. Her experiences with this machine of uncertain date must sometimes have been the reverse of pleasant. How often had I seen her pedalling vigorously to assist an engine which spluttered and misfired as it faced the rising road. One day, however, the old tricar was "no more," and the rider was astride a small-powered solo machine, about a 2 h.p., that the Singer Co. placed upon the market some four or five years ago. This, doubtless, was a great improvement, but now, in turn, this has been discarded for the new Douglas. This rider's experiences would make interesting reading. I imagine few wayside repairs can be unfamiliar to her, but the joy of a well-designed new mount must be intensified by the memories of the vicissitudes met by venturing abroad on an ancient crock.



Nurses at hospitals throughout the country are having a most strenuous time, and a run in a good sidecar outfit is greatly appreciated as a temporary relief from work that is always trying.

A Fellow-feeling.

I can speak, perhaps, feelingly on this score. Well I remember my own first mount, an old open-framed Phœnix-Minerva, for which I—like many another novice—paid a great deal more than its value. Fitted with accumulator and coil and other devices now obsolete, it generally carried me beyond the ken of motor repair shops and then refused to budge. How many times during my first summer's riding did I leave the refractory object in the care of a friendly cottager and trudge home! No sooner did I master one of its failings than another cropped up. It is many years since a discerning poet said, "There are tears in the affairs of this life." Maybe he was the owner of some contrivance whereby he was carried a distance from his "ain fireside" and then "let down."

My Ideal Machine.

I always, when meeting a lady motor cyclist, and I meet many in these days, look closely to gather the make of machine that has captured her fancy. I, like most riders, have my pet ideas of what I consider would constitute an ideal mount. I am looking for a two-stroke for pottering which embodies my choicest features. An engine of about 2½ h.p. with gear box and well-designed open frame, built particularly low, a clutch of the hand-controlled type, and some form of starting arrangement, for, in spite of the two-stroke ease of starting, it is an additional advantage to be able to start up the engine without pushing when required. The lady's Clyno is nearest these ideals, but whilst the military are absorbing all the output and energies of the motor cycle manufacturer, we cannot expect our whims to be considered. When peace is again restored our needs will doubtless receive attention, and we shall participate in the results achieved by experiments in the springing for frames. Occasionally comfort is sacrificed for smartness. I wonder if other lady riders will agree with me *re* aluminium footboards; whilst they please the eye, the feet are apt to slip about them and are unable to get a grip. To my mind, wood covered with rubber or cork-lino is preferable. It prevents the jar to the legs and is generally more comfortable.

A Sidecar Windscreen.

I have had made to my own design a windscreen, the illustrations of which might be useful as a guide

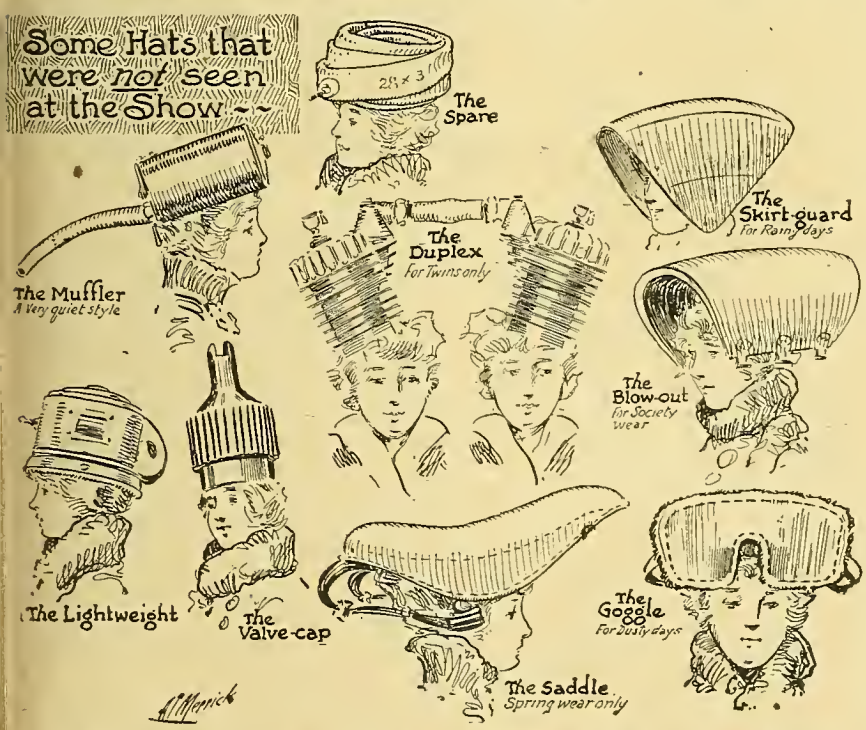
New sidecar screen described by our lady contributor. It is adjustable, and the object aimed at is to get the screen as near the passenger as possible.

to anyone who is thinking of fitting a shield for the passenger. The usual small screen I found to be ineffective, as with an open sidecar the screen is too far from the passenger to be of much benefit; and the door does not allow the screen to be placed nearer. In the one I had made the hinged woodwork allows the whole fitment to be put out of the way—the distance determined by a check strap when getting in or out, and it provides a good cover for the knees of the passenger and diverts the rain spots. By following the photographs a mechanic can make and fix this screen in a few hours.

MAY WALKER.

LADIES IN A TRIAL FOR AUTO-WHEELS IN HOLLAND.

HOLLAND is certainly not getting behind as far as motoring is concerned, and lately has been to the fore with some very novel forms of competitions. Not only have the Dutch held a trial for pillion seats, but they recently organised a trial for Auto-wheels, in which quite a number of lady riders took part. The little machines were represented in several different forms, though most were attached in the usual way. In two cases the attachment was carried rigidly fixed to the chain stays of the cycle and driving direct to the rear wheel. Another was built into the cycle in place of the back wheel, as was illustrated in a recent issue. Several machines were even fitted with light spring forks. These machines must be very popular in Holland if it is possible to obtain a sufficient number of enthusiastic riders to warrant the holding of a special competition.



A set of clever and amusing sketches that appeared in the New York Show number of our contemporary, "Motor Cycle Illustrated."

The increase in the number of lady riders is really remarkable. The majority ride modern lightweights, and it must not be forgotten that the perfection of this type of mount with its clutch and change-speed gear has had a lot to do with the popularising of motor cycling among ladies. At the same time, there are signs of the medium and high-powered sidecar outfit increasing in favour, it being not at all uncommon to meet machines of this type driven by a lady with another in the sidecar.

We should like to take this opportunity of warning lady novices of the advisability of examining the tyres of their mounts with the approach of winter weather. To avoid skidding it is necessary that the studs or corrugations on the back tyre should be in good condition; if worn smooth, or if a plain cover is fitted, a change should be made by the fitting of a good non-skid.

Occasional Comments

"By Ixion"

A Pair of Douglases.

The bulk of my 1915 riding has been done on a pair of Douglas machines, this being the first year in which my 2¾ h.p. has been flanked by its bigger sister. I can hardly praise the big 'un more than by saying I don't know which of the two I like best. I generally found that the 4 h.p. got the verdict for long cross-country work; its weight imbued it with extraordinary steadiness over bad roads, and its extra pace always found a weak spot in such a confirmed sinner as myself. The little 'un found itself under orders whenever there were many stoppages ahead, because it could be propped against a kerb and paddled off when I wanted it again. Neither machine has caused a single road stoppage, even the tyres earning me a pair of white gloves. I hear next year's 4 h.p. is even better than the 1915 edition, and only hope that delivery will be easier to obtain.

The High-efficiency Single.

I do not know that I drew any contrast between the 8 h.p. solo mount and the 3½ h.p. T.T. in my recent article, but a correspondent writes to urge the claims of the high-efficiency or T.T. single-cylinder as a long distance speed merchant's mount. Well, let us essay a comparison. The twin is, perhaps, 10 m.p.h. faster on the road when all out; but, as it can seldom be fully opened out, this does not matter, except in so far as the extra speed is usable on hills. I know that the racing singles often approach or equal the racing 1,000 c.c. twins in the unlimited classes at a hill-climb, but I shrewdly suspect that the surface and corners generally set a limit to the speed of both. At any rate, my own big twins invariably accelerate uphill better than the T.T. single, and touch a higher speed in short bursts on main road hills. Then the twin is heavier, and more expensive to run, which is certainly not in its favour; nor is it so cheap to buy. On the other hand, it will stand a higher gear than the single, and this is a great point, for however pleasant "revs" may be when one is tuning for a brief sprint event, the subdued hum of an 8 h.p. on a gear of 3 to 1 is much less obtrusive company on a 200 mile jaunt. On the next point I must gang warily, for, to speak the truth, I haven't been running a high efficiency 500 c.c. single of late, and singles may have made progress. But on previous occasions, when my pet mount for the year has taken the shape of a T.T. single, I generally found that the m.p.h. above fifty were rather elusive gentry. They were on the spot when it was new, and gradually vanished; a little tuning, and they would return. But in my road work, and especially in hill work, I was often asking the engine to give of its very best; and when the best wasn't forthcoming, I missed it, and was correspondingly irritated. Now the big 8 h.p. is normally run far below its maximum efficiency, and therefore keeps its tune better. Moreover, it usually has a fairish reserve of power up its sleeve, and even when it is considerably under par, it can still do all one is likely to ask of it on the open road. *Ergo*, it does not often inspire the petulant reflection, "The old 'bus is running rotten to-day!"—a sensation not unfamiliar to most owners of sporting singles. Finally, the tuning up and overhaul of the big twin is a much more formidable job than that of the single. No! I had not visualised the comparison which my correspondent suggests; but when I tackle it, I think the big twin just gets my personal verdict.

Side-by-side v. Overhead Valves.

The same writer is on more open ground, methinks, when he challenges my printed preference for the overhead valve. I have not had a season on the 79 × 100 mm. Brooklands Norton, which is the text round which his discourses are written, though oddly enough, I met a man who was a raving maniac about that very machine on the day when this letter reached me. It so happens that all my best twins and singles have had either overhead inlets, or two overhead valves; and as the last really hot side-by-side T.T. machine I owned dates back a year or two, I was probably a little hasty. Track statistics certainly indicate that the side-by-side valves hold their share of the records. Still, I won't plead guilty. Theory and racing car practice are all in favour of the overhead valve. Motor cycle designers have never had a really free hand. In the motor car world racing and touring practice are sharply divorced, and nobody expects a Sunbeam or Peugeot Grand Prix racing engine to be ostensibly a partial copy of the standard pattern. But, for some curious reason, there would be a horrible outcry in our correspondence columns if the Triumph Co. (Mr. Schulte will pardon my using his firm as an illustration) should win a T.T. with an overhead valved engine, and then stage side-by-sides at the next Olympia. So I am not sure my thoughtless impressions were not justified. When I have had the opportunity to test the two designs in the same year, the overhead pattern has impressed me as showing the more ginger. It may be true to-day that you can buy a side-by-side, *e.g.*, a Norton, which is quite as lively as any o.h.v. on the market; but it hardly follows that if Mr. Norton thought well to build an o.h.v. for track and T.T. work, it would not give his side-by-side several seconds in a mile. I suppose the fact is that the average motor cycle business is hardly big enough to justify the creation of a special racing department; racing is just one of the odd jobs which is squeezed in between other things, according as the buying public happen to be interested in speed events, or the firm wants a leg-up in the advertising department. Whereas, in the car world, racing is scientifically organised by the crack firms at any rate, and time, men, and money permit a racing programme to be pursued "regardless," in the motor cycle world the ordinary staff take the ordinary engine, and adapt it as well as circumstances permit.

THE TREND OF ITALIAN DESIGN.

An Interesting Italian Machine Reminiscent of Several British Makes.

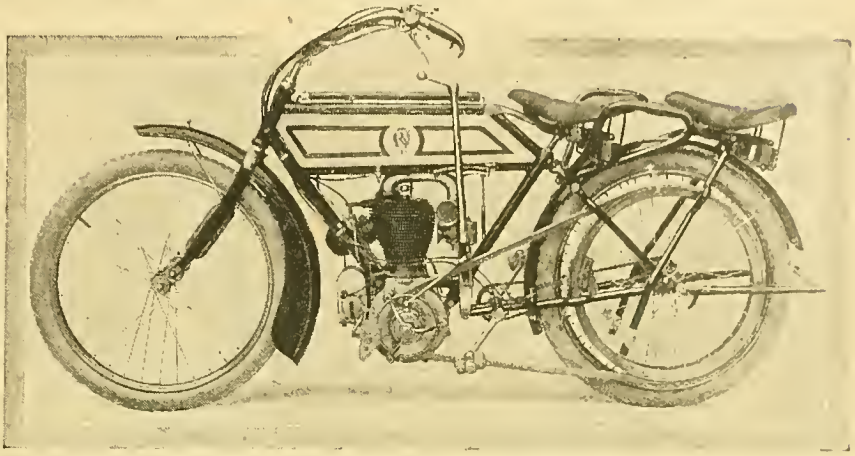
WE have on more than one occasion commented favourably on the clean lines and attractive appearance of the motor cycles lately produced in Italy, and noted a growing resemblance to British motor cycle design. The Borgo machine, which we illustrate herewith, is no exception to the general tendency referred to; it is taking in design and of sound construction.

The engine, which strongly resembles the Rudge, has a bore and stroke of 85 × 88 mm. (499 c.c.), the popular British size; the inlet valve is overhead, and, of course, mechanically operated; the Bosch magneto is carried in front on a platform cast with the crank case, is handle-bar controlled, and provided with a cut-out.

Reference to the illustration of the single-seated model will show that the timing gear and magneto transmission are contained beneath a single cover—a very commendable practice—but the cover itself strikes us as being rather ornate, for though the coat-of-arms looks well when clean, it will, in use, collect much dirt, which will be difficult to remove. The outside of a crank case should be smooth and free from crevices. The carburetter—a special two-lever type—is constructed in the Borgo factory. The silencer, it will be noticed, is unusual in appearance, and although it will probably prove very effective from the point of view of absence of back pressure, it is unlikely that its silence would satisfy the authorities in this country unless it were furnished with a pipe to the rear. Both oil and petrol pipes are provided with rubber insertions. So much for the power unit.

The Variable Gear.

Turning now to other details, we come to what is perhaps the most novel point of the whole machine, viz., the variable gear. This consists of an expanding pulley such as is fitted to several British machines, and a method of maintaining correct belt tension by moving the rear wheel in the manner of the Zenith. However, in this case, not the rear wheel only, but the whole of the rear part of the frame moves backwards and forwards. This rear portion is pivoted below the saddle, and the front ends of the chain stays are carried by the extremities of a long lever, which extends upwards on the left side of the tank and has its fulcrum on the engine bracket. When this lever is pushed forward it forces the wheel backwards and tightens the belt, at the same time opening the pulley. The pulley can be further controlled by rotating the lever; thus, a free engine and clutch can be brought into use at the requirements of the rider. The pedalling gear (used for starting purposes only) is mounted upon the chain stays, and so the tension of the chain is unaffected by any movement of the wheel; the chain is, however, provided with a jockey pulley on its under side. The arrangement of the movable part of the frame and the distribution of weight is such that the weight of the rider tends to maintain the belt tension.

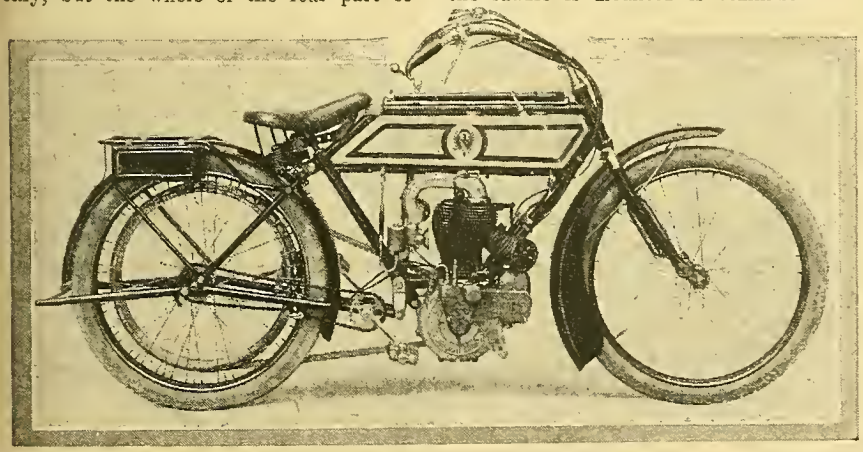


The tandem-seated Borgo, a new Italian production. A variable pulley gear in conjunction with an extensible rear frame is adopted.

Tandem Seats.

The cantilever arrangement upon which the saddle is mounted is reminiscent of another British machine, viz., the Rex. In one of the illustrations a second seat, together with hand grips and footrests, is shown mounted in the rear. This method of carrying a passenger is very popular in Italy, being much cheaper than a sidecar and more comfortable than the padded pillion-seat. The handle-bars are adjustable, on the lines of the A.B.C. or Indian, but the spring forks are essentially Italian. Two brakes are applied to the belt rim—one on either side of the V—and both are operated from the handle-bars by means of Bowden cables. The stand is of the spring-up variety, but differs from those to which we are accustomed in this country. When a carrier is fitted, neatly constructed metal-cased tool boxes are supplied. The tyres are heavy Dunlops, 26in. × 2⅜in.

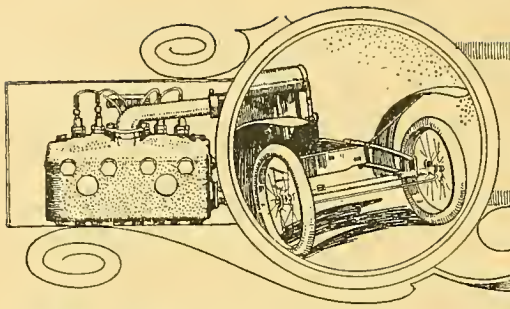
We understand that the Borgo (but with a single gear) is being supplied in large quantities to the Italian Government. The Italian manufacturers are making but few changes for 1916, as the more important houses are fully occupied with Government work, while business in general is more or less at a standstill. Messrs. Bianchi, whose motor cycle we illustrated and described some time ago, are adopting belts instead of chain drive, for the sake, we presume, of economy and simplicity.



The single-cylinder Borgo, showing the extended ribbed exhaust port which takes the place of the silencer. The engine dimensions are 85 mm. × 88 mm. = 499 c.c.

CAUSE AND EFFECT OF A BREAKAGE.

A LIEUTENANT-COMMANDER in the Navy recently broke a timing wheel of his twin-cylinder sidecar outfit owing to the fact that he accidentally left the throttle open when declutching on a hill. He has applied to the makers for a spare, and was astounded to hear that it is quite impossible for them to supply another. The machine was bought second-hand, and this point should be a warning to readers to take care when selecting a second-hand outfit that it is not of obsolete design, or, at any rate, that spares are available.



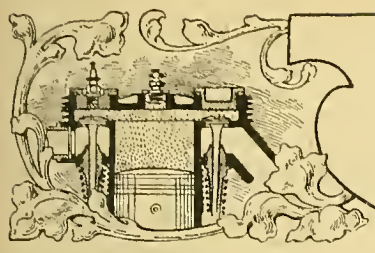
The Future of the Cycle Car.

By ROAD RIDER.

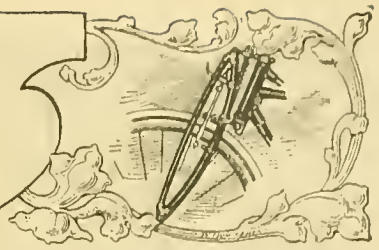
MY colleague "Ixion" published a paragraph on p. 389 of our issue for October 21st last, entitled "The Grease is Coming," in which he stated his conviction that there is a great and permanent demand for light four-wheelers on motor cycle lines, which the trade would do well to study. Some people consider the cycle car to be as dead as the dodo, but my own belief is that it is no more extinct than the lightweight bicycle was extinct when half a dozen premature attempts to foist 80 lb. machines of little roadworthiness merely led to fresh booms in heavier and more expensive patterns. The demand for a light, efficient, comfortable, and economical four-wheeled two-seater must in the nature of things persist until the mechanical and commercial problems which surround it are solved. The fact that the latest attempt to foster such vehicles has produced something entirely different, to wit, the £120 sidecar outfit de luxe and the £200 12 cwt. light car, does not prove that the demand is non-existent, or that it cannot be fulfilled. It only shows that the trade is not yet able to solve the problems. The reality of the demand is proved by the huge sales of the Morgan runabout and the high-powered sidecar, not to mention the big output of the more costly G.W.K. light car, and the fairly numerous sales of such four-wheeled motor cycles as the G.N., Carden, etc., etc. Sooner or later the trade will return to the cycle car problem like a giant refreshed with wine; one of its returns—perhaps the next return—will not be as premature as former essays; and then the cycle car boom will come. It might have been with us already if half the energy devoted to developing the ancient single-geared motor bicycle with basket chair attachment had been concentrated on light four-wheelers, not too ambitious in design. The usual history of developments in the motor cycling industry is that the trade and the public agree in recognising an empty niche. The trade is making some other type of vehicle, which it can sell; and it shrinks from entering a breach which it may fail to fill. Small firms rush in, and do good pioneer work, without achieving full success. They sell a few dozen machines, perhaps even a hundred or two. Some journal or other exaggerates the merit of the new patterns. The public is misled into forming a false estimate, and pays for its blunder. The premature boom peters out, and there is a lull. Finally, some genius produces a machine which succeeds. The trade jumps off the fence, and the big firms seize the idea, and improve on it. Presently, a new type which is roadworthy is successfully launched. This final stage of the cycle car movement is possibly nearer materialisation than the public thinks.

There are two factors in the present situation which contain hints of big events. One is the evident determination of the American factories to supply us with practical four-wheelers at £100 or so. Every sidecar maker knows that if the Americans succeed, the sidecar de luxe will be killed, for good and all. The American factories are probably inferior to our own in engineering skill and honesty; they are less clever, and they have often shown a lamentable willingness to "boost" inferior stuff; but they may easily point the way towards the solution of the engineering problems, and their commercial honesty is improving under stress of competition. In the other and more acute aspect of this particular problem they display positive genius; nobody can equal them in scientific economy of production. They certainly threaten alike our sidecar and light car industries. I regard it as certain that within a very few years they will be offering us cheap four-wheeled two-seaters good enough to challenge the sales of the big sidecar outfit and the £200 light car.

On the other hand, the number of British factories and engineers more or less connected with aviation work has increased by leaps and bounds during the war; and this work bristles with suggestions of potential value for the future cycle car. For an example, a not uncommon type of aeroplane chassis is built of spruce; its main frame members may not exceed 5in. × 2½in., hollowed out on each side, and drilled for lightness, stiffened with wire stays and strainers attached to the spruce beams by sheet iron clips. Such a chassis resists all the strains of gravity in banking or volplaning or looping the loop; it remains true under wind resistances equal to speeds of 100 m.p.h. or more; and it bears engines up to at least 100 h.p. When the industry settles down again, many of these suggestive facts will permeate the designers of road motors. The transit from such chassis to something on the lines of a modernised Orient buckboard is neither long nor difficult. Such detail inventions as the Harcourt radiator assist the elimination of water-cooling. Light and cheap three-speed gear boxes have now been perfected for motor bicycle work, and with slight modifications would suit the next batch of cycle cars, whilst the tendency to organise factories specialising in components produced by the thousand all helps. The belt drive is gaining a new lease of life, as adapted to run over big pulleys in the secondary half of the transmission. A cycle car far surpassing all previous essays is already practicable: and the situation changes with incredible rapidity. If only one leading firm, possessing clever engineers, sufficient capital, and a position of authority, should elect to jettison the make-shift sidecar de luxe when peace returns, and concentrate its attention on the £100 four-wheeled, two-seated cycle car, the industry may easily be revolutionised.



"THE MODERN MOTOR CYCLE ENGINE."



"UBIQUE'S" CRITICISM OF MR. WORSDALE'S ARTICLE. (Issue October 28th).

IN his article headed "A Masterpiece of Mechanical Paradox," Mr. Worsdale touches with no light finger several very sore spots in motor cycle design and construction.

No one with any pretence to mechanical knowledge can condone the criminal lack of bearing surface either in the top or bottom end of the connecting rod nor "the ingenious application" of the flywheels to prevent oil reaching the big end bearing.

On the subjects of solid crankshaft, outside flywheels, and mechanical lubrication, the editor has allowed me to air my views on previous occasions, so that I will not enlarge on these points now, except to agree cordially with the writer.

So far, then, my humble opinion is in agreement with Mr. Worsdale, but, though his destructive criticism as such is excellent, he does not help us much with regard to the future.

Pistons and Cylinders.

Piston design on motor cycles is usually bad, but what material are we to use in place of cast iron? In the course of twelve years' work on internal combustion engines for land, sea, and air, I have seen many substitutes tried, but in nearly every case the designer has come back to some form of cast iron as the most suitable for all-round purposes. Steel pistons are satisfactory where large clearances are permissible or when distorted pistons can be easily replaced, such as is the case in racing practice. The built-up steel piston is perhaps the most satisfactory form, though under continuous hard work it not infrequently disintegrates at an awkward moment. Perhaps aluminium pistons were the type Mr. Worsdale had in mind. A considerable amount of experimenting is going on in this direction at the present time, especially in America, but let us not forget that this is no new idea and that one of the best known British automobile firms has had pistons of this type under observation for years, yet has not adopted them on the latest models.

Much the same argument applies in the case of cylinders. Steel cylinders, though excellent in tension, are limited in design to commercial machining possibilities. Cast iron, it is true, is vile in tension, but a cast iron cylinder need not be held down from the base. As I write I have before me a ten year old amateur-built motor cycle engine, having a cast iron cylinder held down from the head. The cylinder walls are only 2½ mm. thick, and yet the engine runs well and pulls good power per capacity and does not burst cylinders. I may add that this engine has a one-piece crankshaft, large bearing surfaces, and a symmetrical outside flywheel.

Valves and Tappets.

Overhead valves are obviously the most correct, but, though the ideal inlet and exhaust valves should differ both in size and shape, commerce once again steps in, and it will be found that the *pros* and *cons* of each type about cancel out. Internal cams are more or less obsolete, as the chief exponents of this type discarded it for 1915. Offset tappets are an abomination, and adjustable tappets are usually much too heavy. Mr. Worsdale admits that he is a keen rider, and, in consequence, his machine should prove a most interesting one, for I cannot believe that one so keenly alive to the faults of existing types would leave these faults unimproved.

In conclusion, may I hope that now Mr. Worsdale has pointed out the many weaknesses of the motor cycle engine, he will prove himself a public benefactor by giving us the benefit of his experiences both in general design and alternative materials.

THE LIMITATIONS OF A MOTOR CYCLE DESIGNER. By A. C. Wickman.

PRACTICE and theory do not always agree. An engineer has well been described as being a person who can do for one shilling what any fool can do for two. It is unfortunately very often that the ideal (in theory) clashes with practical considerations, such as machining and cost. As these two are dependent on one another, and as the price of a machine cannot successfully be raised above a standard set by other firms, it is necessary to modify the ideal theoretical design so as to conform with these practical factors. There are two ways of producing a new design.

(1.) By trial, *i.e.*, eliminating designs which are found to be defective.

(2.) By theory, *i.e.*, strictly applying the principles of mechanics.

The second, in many cases, becomes too complex to handle. The first takes time, is wasteful, and therefore expensive. Here, as in many other cases, we have to be content with a compromise. The production will, therefore, have to be by means of theory coupled with practice. Take the case of the H-sectioned connecting rod. Now on a strength for weight consideration the tubular one is considerably preferable; that is, if we could make the connecting rod complete with no joins. This is an impossibility; the two chief ways of manufacturing them being to press them out in halves complete with gudgeon and

SIDECAR MACHINES FOR DESPATCH WORK.

A French despatch rider, attached to the headquarters staff of the 138th Brigade, who uses a Triumph sidecar outfit. When the picture was taken, three weeks ago, the machine had seen nearly twelve months hard and daily service.

main bush holders, and to weld them down the centre, or to keep the tube weldless and to weld the bush-holders.

Quantitative commercial welding is rather an uncertain thing. When one, or even a few pieces, are done by a firm specialising in this sort of work, the results are very satisfactory, but when you have got to turn them out in thousands it is quite a different matter. They cannot each be tested, except by the eye of an expert. A sample one may be taken from a batch and tested to destruction, but this gives no promise that the others are similar (a thing which is rare even when welded by the same man). The cost is high and quantity does not materially decrease the welding charges. The H-section rod, however, lends itself easily to quick and cheap production, and can be forged complete with upper half of a split brass bearing if wanted.

The Strength of Aluminium Alloy.

As regards the piston. Here undoubtedly there is vast room for research. Shall I send cold shivers down the back of your contributor when I say that an aluminium alloy seems to give the best results?

Mr. Worsdale refers to aluminium as having a consistency resembling hard cheese. That may have been so many years ago, but improvements have been made. The Alloys Research Committee in their report of 1912 obtained an alloy consisting of approximately 25% zinc, 3% copper, and 72% aluminium, the sand castings of which, after annealing for one hour at 400° C., gave a yield point of 15.3 tons and an ultimate stress of 17.23 tons per square inch. I think that your contributor will agree that it is some cheese!

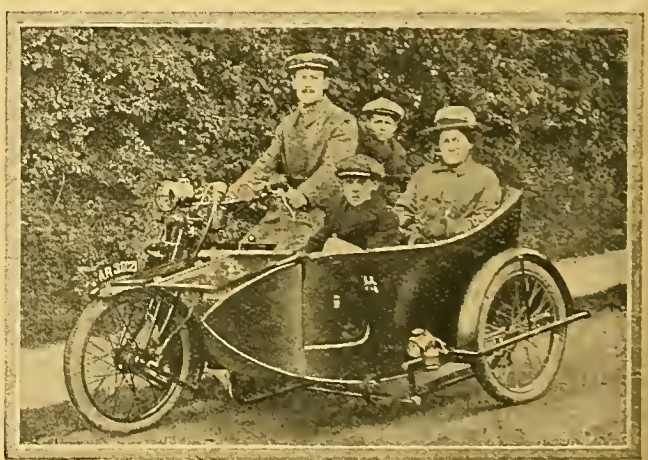
Let us consider the case. From a mechanical standpoint the material should be tough and have a high elastic limit. This the alloy has to a marked degree. From an efficiency basis the material must be light and of high conductivity.

It is a well known fact that in order to obtain a good m.e.p. at high speeds, high compression should be used. This latter, however, is very limited owing to pre-ignition. If, however, we use a piston with a high conductivity, we could get rid of more heat, and therefore increase our compression ratio, thus obtaining a higher m.e.p. for that particular critical speed. The power curve will not loop over so quickly, and we shall have a more efficient machine. Of course, the coefficient of expansion is large, and care has to be taken to provide the necessary clearance; but this has been successfully done, and though a slight slap may be heard when starting from cold, twenty or thirty revolutions are all that are required to make them run as silently as any others. Also from a machining point of view it is an ideal metal. However, great care is required in the temperature regulation when annealing, as if too cold it gets hard, and if too hot it powders.

Mr. Worsdale also says that cylinder studs work loose, timing case stud holes strip their threads, and ball races in gear boxes have to be held by bronze rings. As regards the first, do not blame the material; alter the design. The studs can easily have enlarged ends through which the case bolts can pass (as in the Douglas). A little experimenting in threads and stud sizes will, I feel sure, cure the second. The third is nothing but condemnation of really good practice.

The outer race should be a sliding fit in its housing, and if the bearing gets gritty it may occasionally turn. Aluminium as used for gear boxes is not good as a bearing material; no one wants it to be. (Mr. Worsdale seems to think that an aluminium box has not enough mechanical strength to hold together without a skeleton frame.) By pressing in a bronze ring as a housing we have an ideal bearing. Perhaps your contributor does not realise that aluminium is daily coming into greater use. An entire car engine has been constructed of it in America, the valve seats, guides, cylinder liner, and other friction parts being of steel or cast iron as the case may be. An aluminium cylinder with deep taper fins would give ideal cooling.

Lightness, moreover, is a super-consideration amongst the public, as it means more speed, less upkeep, and less wear and tear for the same power.



A NEAT FAMILY SIDECAR OUTFIT

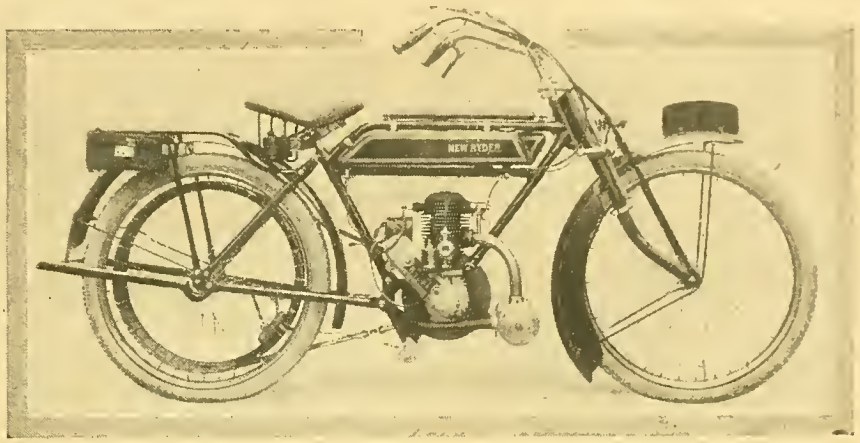
The owner is Mr. T. Suffling, of Hitchin, and the machine is a 6 h.p. 1915 model A.J.S. with a Bowser two-seated sidecar. Mr. Suffling is very pleased with the complete outfit, and he tells us he gets sixty miles per gallon with a full load.

NEW MODELS

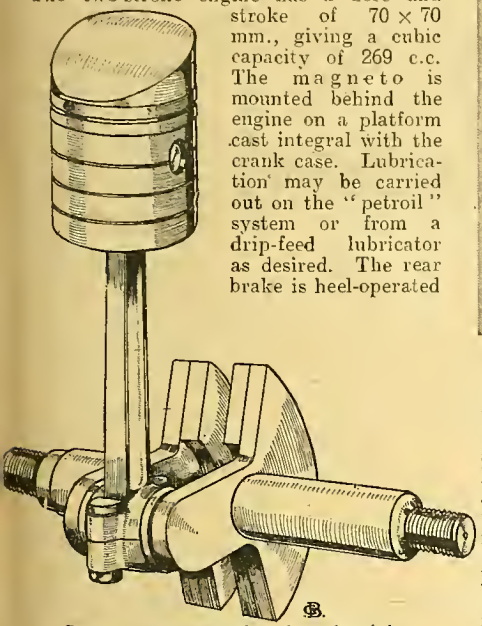
· MANUFACTURERS' PROGRAMMES FOR 1916 ·

THE TWO-STROKE NEW RYDER.

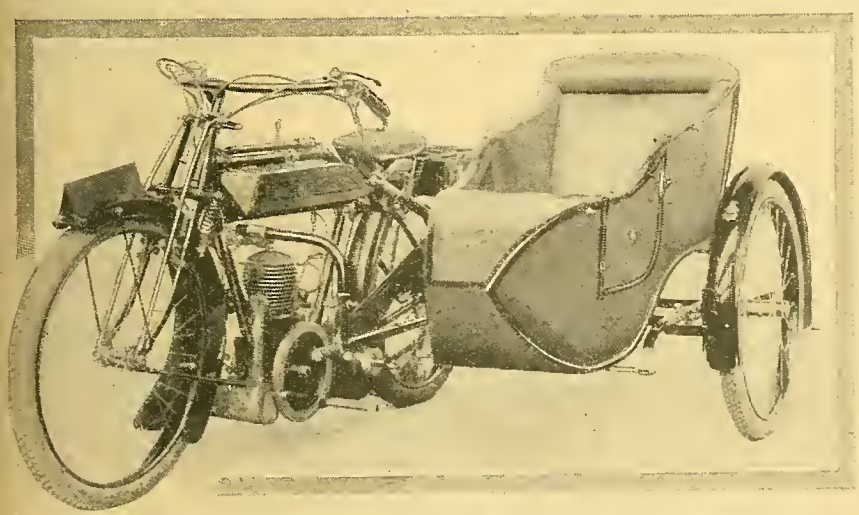
IN our issue for October 21st we briefly described New Ryder models for 1916. We are now able to furnish a further description of these machines. The two-stroke engine has a bore and stroke of 70 × 70 mm., giving a cubic capacity of 269 c.c. The magneto is mounted behind the engine on a platform cast integral with the crank case. Lubrication may be carried out on the "petroil" system or from a drip-feed lubricator as desired. The rear brake is heel-operated from the left footrest, and the front is the ordinary Bowden rim brake operated from the handle-bar. The frame has a dropped top tube which affords a low riding position, and Saxon spring forks are fitted. The release valve is enclosed, and has a connection to the exhaust pipe, and the silencer, which is large and most efficient, is furnished with extension pipes at each end. New Ryder machines are supplied either with a single gear, as illustrated, or two-speed countershaft. Referring to the sketch of the internal parts of the engine, it will be seen that grooves are provided in the piston to assist lubrication. The finish is in black enamel, the tank being black with a broad gold line round the edges. A desirable feature of these machines is the freedom from vibration which is experienced when on the road, denoting careful attention to engine balance.



1916 pattern two-stroke New Ryder, the improvements to which are referred to on this page.



Piston, connecting rod, and cranks of the two-stroke New Ryder.



A lightweight passenger outfit—the 1916 model 2¾ h.p. Excelsior sidecar machine. The engine is a two-stroke, and chain drive throughout, in conjunction with a two-speed countershaft gear, is employed

NO ALTERATIONS TO A.J.S. IN 1916.

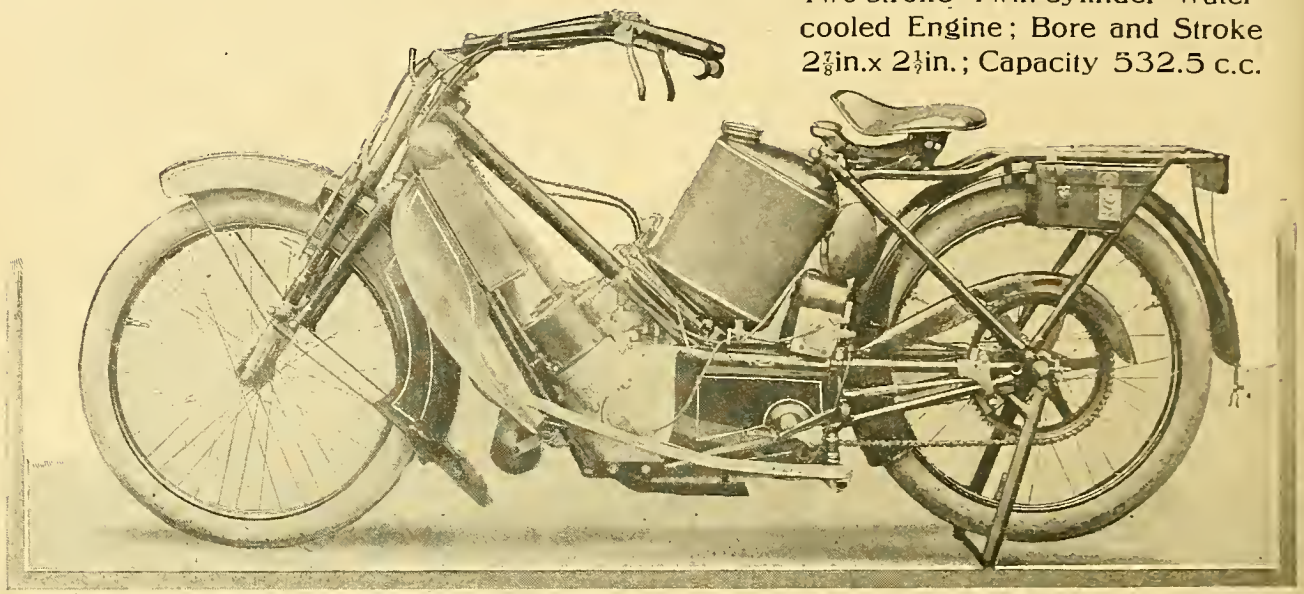
WE learn from Messrs. A. J. Stevens and Co., Ltd., that A.J.S. machines in 1916 will be exactly as produced during the present year. The entire absence of change is not only due to the fact that a large section of the works is busily employed on munitions of war (including parts for Clyno machine gun sidecars), but also to the fact that A.J.S. machines have proved so entirely satisfactory that little or no change is called for. The most popular of the series during the present year has proved to be the 6 h.p. twin-cylinder three-speed mount, which, with its detachable and interchangeable wheels, is, and will remain, a sidecar mount *par excellence*.

The 4 h.p. model with a sloping top tube has been a mount much sought after in 1915, but there have been difficulties connected with this model as regards delivery.

It may not be generally known that three Princes of the Royal Danish household are enthusiastic users of the 6 h.p. combination.

Scotts for Next Year Practically Unaltered.

Two-stroke Twin-cylinder Water-cooled Engine; Bore and Stroke 2⅞in.x 2½in.; Capacity 532.5 c.c.



NO alterations worthy of special note are taking place in the construction of the Scott motor cycle for 1916. A fifth point of connection has been added to the sidecar couplings, this consisting of a light steel rod passing between the front end portion of the sidecar chassis to the steering head, a hole being drilled through the leg shield for its admission. While this extra connection adds little to the work of attaching and detaching the sidecar, it very much improves the steering of the outfit when a heavy load is carried.

A Dixie magneto is to be fitted as standard for 1916, and a B. and B. or Binks carburetter to order.

Running briefly over the mechanical points of this machine, the engine is provided with roller bearings throughout. All parts are in constant thrust. Lubrication is mechanically operated by the engine and automatic in action. An adjustable sight feed is provided.

The gear is foot-controlled and simple in construction. Two chains drive from the engine to the countershaft, and the countershaft sprockets are mounted on expanding ring clutches. These sprockets, being of different sizes, represent the high gear and the low gear respectively. The drive to the rear wheel is by a Hans Renold heavy ½in. pitch chain.

Artistic and efficient leg shields, set on either side of the radiator, protect the rider's feet and legs from cold and mud. These shields, also the footboards, are instantly detachable, and the boards are sprung at both ends.

The spring forks provide for vertical movement only. All working parts are enclosed, and specially strengthened for sidecar use.

An open frame, providing very low centre of gravity, is a special feature of the Scott machine, this being immensely strong, and designed throughout to meet the strains of high speed and hard usage.

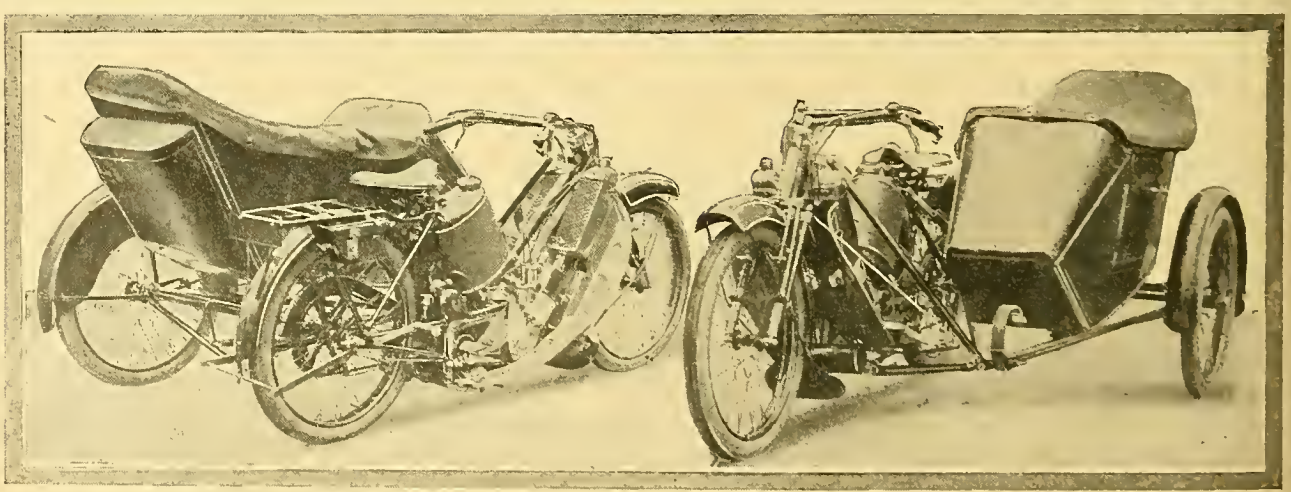
The kick starter is situated well back, being almost on a level with the rear wheel.

The Scott engine is capable of enormously high speed, and owing to its low centre of gravity the machine holds the road remarkably well.

The Scott Sidecar.

The Scott sidecar is of very rigid construction, and the body is excellently sprung. All straight tubes are used. The springing is instantly adjustable to suit the passenger's weight, and ample provision is made in the way of space for carrying spares, etc.

The sidecar body is finished purple with thin white relief lines to match the tank.



The 1916 pattern Scott passenger outfit. The right-hand view shows the additional sidecar connection, which consists of a light steel rod from the forward end of the sidecar chassis to the steering head—a lesson from sidecar machine gun experience.

It is worth while to wait when you know it is waiting for a good thing.

Will you wait while we fill the urgent needs of the Country—while we help, as far as it is in our power, the men bearing the heat of the fray ?

To every patriotic Britisher the Country's needs come first. The destiny of Empire is in the balance. Will you surrender your personal requirements in this hour of stress, while we throw our immense manufacturing resources into the scales, and wait for the day of peace which every moment draws nearer ?

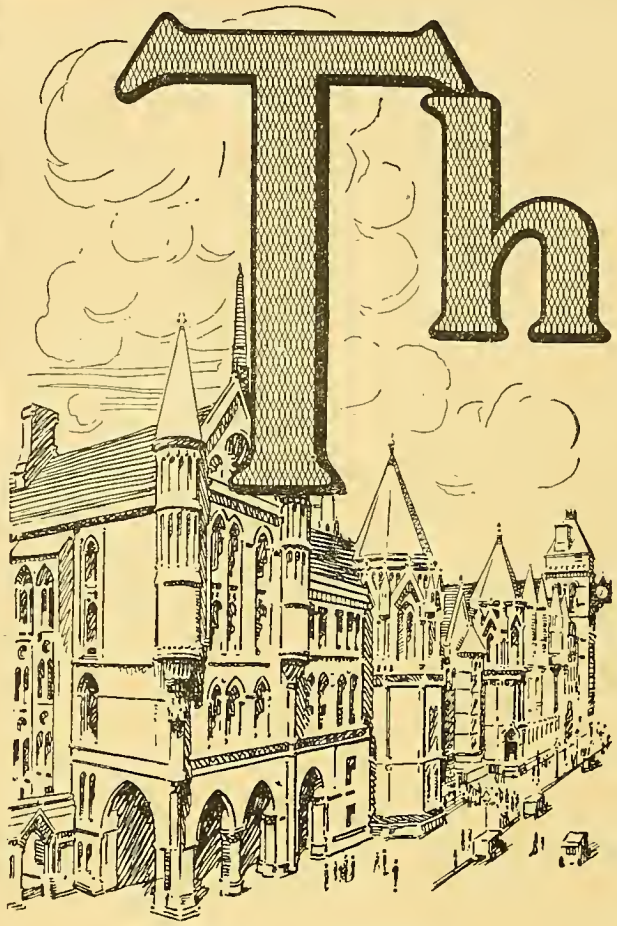
The Triumph Motor is doing a great work in helping our brave men, but the call is constant and insistent for more—a striking tribute to their marvellous efficiency.

Will you help us and wait ? Peace day will again see us at your service.

Triumph Cycle Co., Ltd., Coventry.

TRIUMPH

Thrift



THE LAW COURTS

JUSTICE

invariably ensures that all transactions between buyer and seller shall be reasonably equitable, and if at any time the buyer receives less of value than is his by right, justice may be obtained by legal methods, but few will agree that there is anything of thrift behind any transaction having such a sequel.

The B.S.A. Trade Mark is the reliable guide to motor cycle value. The B.S.A. Company places everything—reputation, goodwill, business advancement, and success, upon the quality of the article to which is attached the B.S.A. Trade Mark. In the case of the B.S.A. Motor Bicycle, the whole energy, facilities and organization of a vast concern is centred upon one ideal, that of giving to the public such goods and service as will ensure complete satisfaction for the purchaser, and at the same time enhance the reputation of B.S.A. manufactures.

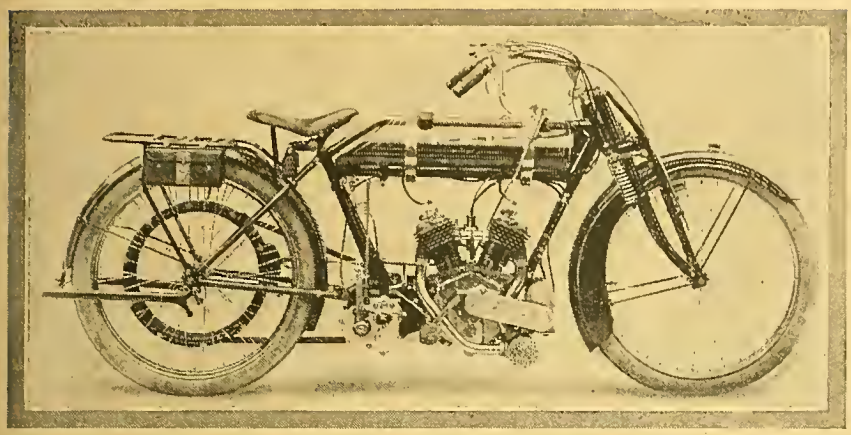
1916 Model N.U.T.'s.

Countershaft Three-speed Gear and Twin J.A.P. Engine.



The latest 3½ h.p. twin-cylinder countershaft-geared N.U.T.

ALTHOUGH there has been no T.T. race in the Isle of Man this year, the name of Hugh Mason and the famous N.U.T. machines are always associated with speed and reliability.

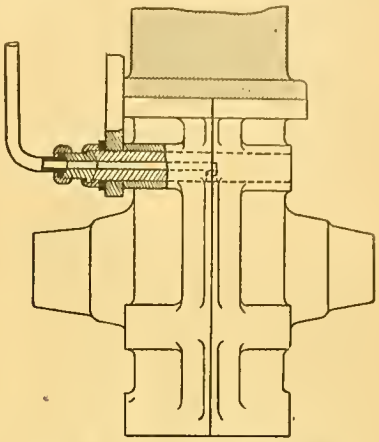
The machine is still almost unaltered, except that a countershaft, and, of course, chain-cum-belt transmission, now replace the hub gear model always used in these exciting events.

The N.U.T. models for 1916, with the exception of a few small details, are practically the same as in 1915, two extremely neat machines being the 3½ h.p. twin standard and the 6 h.p. standard, which we illustrate. The 3½ h.p. is fitted with a side-by-side valve J.A.P. engine, 70 × 64.5 mm., giving a capacity of 496 c.c. An S.A. three-speed countershaft gear is fitted, with kick-starter and chain-cum-belt transmission. The latest pattern Druid fork, which gives both an upward and backward motion, is a feature of this model. The neat cylindrical tank is still retained, while the large filler caps are a useful feature, gained by experience in the T.T. races, the lubrication being by a sight drip-feed pump. The riding position is very low, the top of the full-sized saddle being level with the top tube. The footrests are fitted amidships, which should give an extremely comfortable position.

The fitting of the rear brake shoe on the outside of the belt rim makes it an easy matter to remove the back wheel. The 6 h.p. model, which is intended for sidecar work, is almost identical in detail with the 3½ h.p. model. Long upturned footboards are fitted, and the sidecar lugs are brazed to the frame. The whole machine presents a substantial yet neat appearance.

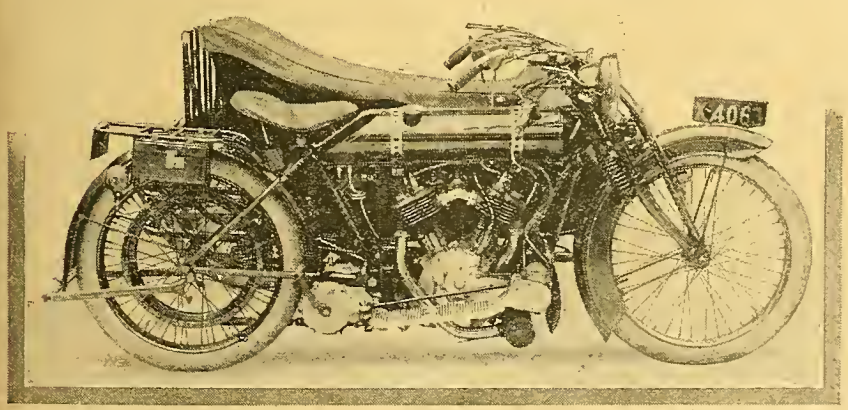
AN EXPERIMENTAL OILING SYSTEM.

IN our issue of October 21st we described and illustrated a new method of oiling on the two-stroke Revere machine. The engine on this mount is a Villiers, and it transpires that the system of oiling referred to, viz., by a pump to the hollowed out crank case bolt forming the engine hanger, is a system which has been introduced by the Villiers Engineering Co., Ltd., but which the company ask us to mention has not yet passed the experimental stage. The drawing accompanying will convey an accurate idea of the system, the oil passing direct into the crank case instead of *viâ* the induction pipe as on the 1915 Villiers, but,



The Villiers experimental oiling system.

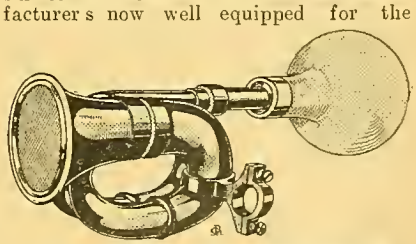
owing to the war, and the difficulties in obtaining labour and materials, it is not likely that it will be used on standard Villiers engines for some considerable time.



1916 model 6 h.p. N.U.T.-J.A.P. passenger outfit. Features to be noted are the three-speed countershaft gear and the latest pattern Druid forks.

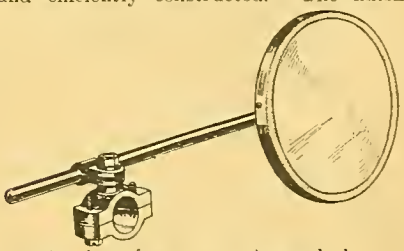
BRITISH MOTOR HORNS AND MIRRORS.

HITHERTO the production of motor cycle horns and mirrors has largely been in the hands of the Germans, and it is cheerful to find one or two British manufacturers now well equipped for the



The British-made black-finished Hill bulb horn.

production of these minor necessities. Thus it is good to announce that we have recently received a horn and back glass from Messrs. Ernest H. Hill, Ltd., Beta Works, Sheffield. These are of black finish, and are very strongly and efficiently constructed. The finish



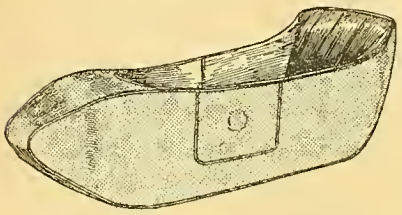
A mirror for motor cycles made by Ernest H. Hill, Ltd.

is excellent, and the provision made for their attachment to the machine is of ample dimensions.

WATSONIAN SIDECARS FOR 1916.

A Comprehensive Range.

THE chief feature of the Watsonian programme for 1916 is the Aero model produced for use with 3½ h.p. bicycles, when weight must be kept at as low a figure as possible. In this case the sidecar weighs but 29 lb., and is of unusually attractive exterior, besides being comfortable, almost luxurious, to ride in, and well fitted out for the comfort and convenience of the occupant.



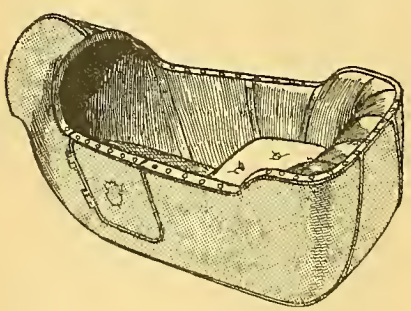
Watsonian tourist model sidecar.

Broadly speaking, the outline of the body, with its curved back and painted tapering front, resembles the French battleship of a year or two ago, and the resemblance would be more complete but for the absence of the familiar "tumble home" sides.

As can be seen in the sketch there is a ram bow, very pleasing to the eye, while the sides taper from the rounded back panel until they sweep in to follow the arched cover over the occupant's feet, and form a convenient edge to which the apron may be attached. Beneath the seat is a locker for such spares or extra tools as the owner may desire to carry.

As the panels are of three-ply wood, and the utmost care is taken with the joints and moulding, the whole structure is remarkably stiff and does not seem likely to develop rattle or strain under hard usage.

The above machine looks at its best fitted to, and is indeed designed for, a sporting machine. For touring mounts there is another new model, without the ram front, but with a more blunt outline and more room. The touring model is



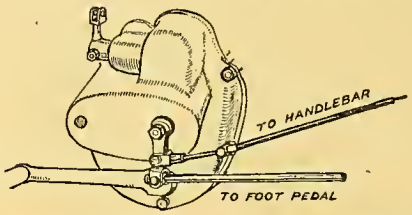
Novel lines of the Watsonian "Aero" model sidecar.

also beautifully upholstered, has a pocket in the door for maps, goggles, or other small details, a locker below the seat cushion, and weighs 30 lb.

Two new wicker bodies are to be marketed—the model S, which is the wicker equivalent of the sporting model Aero, and the new model T, which is made as the equivalent of the wooden Tourist model.

A FOOT OR HAND-CONTROLLED CLUTCH.

OWING to the Premier Co., Ltd., Coventry, being almost entirely on munition work, the output of motor cycles is naturally extremely limited, and the 1915 models (very few of which are on the road) will be continued with practically no change whatever, except in small details. A refinement which will be appreciated is the fitting of a Bowden hand control, in addition to the pedal, for operating the clutch. The Bowden cable is attached to the operating lever just above the rod from the foot control. This rod is attached in such a way that, if the clutch is operated by hand only, the rod will slide through the operating arm, so that



Combined handle-bar and foot-controlled clutch—a new fitting on the Premier.

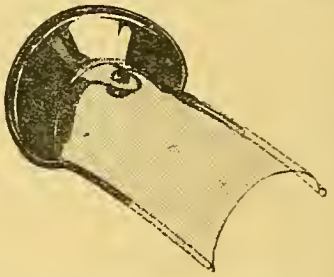
the pedal is not moved as well. Thus, it is truly a foot or hand control, and not simply interconnected. The chief advantage of this dual control is that the average clutch requires a considerable amount of force to operate it by hand, and so throws too great a strain on the cable; whereas with the Premier method it is possible to take the clutch out by foot, after which it is quite light work to hold it out and let it gradually in again by hand, while both feet are free.

RUDGES IN 1916.

THE Rudge-Whitworth Works, like most other motor cycle factories throughout the country, are so busily engaged on munitions that it has been found quite impossible to devote any attention to the question of modification to current models. Indeed, the Rudge being a Government controlled works, the only type of Rudge which is being made is the 3½ h.p. Roadster Multi, and this will be continued in 1916 as in 1915. Even prospective buyers of this machine have had to take a back seat, as the output, we are told, is absorbed by the British Government or our Allies. Rudge depots throughout the country have been practically drained of all motor cycle stock during the past few months.

"NO CHANGE."

The Lea-Francis and the James are two more manufacturers of popular types of motor cycles who propose no change in the specification of their 1916 models. The output of both firms, it is needless to mention, is greatly restricted owing to Government demands.

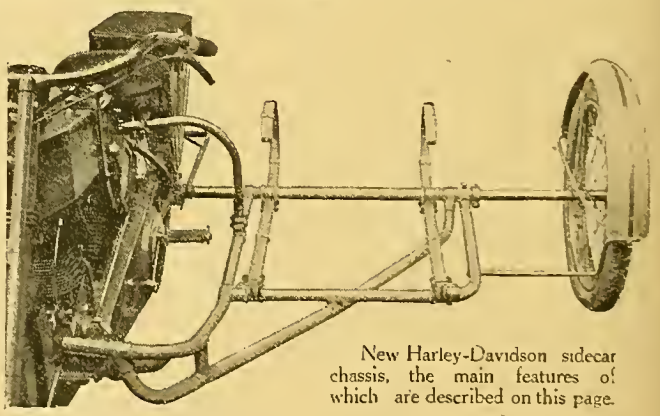


A Levis refinement. Extension on forward end of front mudguard, a useful addition that will be appreciated in very rainy weather.

1916 HARLEY-DAVIDSON SIDECAR CHASSIS.

THE accompanying illustration gives a very clear idea of the Harley-Davidson sidecar chassis, which, we may mention, is the same as that to which the ambulance for Russia, illustrated in our issue of the 28th ult., is attached. It will be noticed that the axle is telescopic, so that the width of the track is variable from 44in. to 56in. The mudguard is of exceptional width and very substantial, while the wheel has a voiturette rim and a 28in. × 3in. tyre, interchangeable with either tyre on the motor bicycle. The hub is said to be 100% over strength.

Another feature is the diagonal member running from the extremity of the main rear member to the forward attachment, stayed by lugs on the centre longitudinal member, and on the forward cross member. Compensating ball joints are provided to the four main points of attachment.



New Harley-Davidson sidecar chassis, the main features of which are described on this page.

"THE MOTOR CYCLE" RECRUITING SECTION.

A Limited Number of Vacancies in the Motor Machine Gun Service.

AS showing the patriotism of manufacturers in encouraging men desirous of enlisting, it is interesting to note that the following employees of the New Hudson Cycle Co. (Repairs Dept.) have recently joined the Motor Machine Gun Section, every one of them possessing excellent testimonials from the directorate:

B. Bourke.
A. Holroyd.
T. Rigby.
J. H. Beasley.
W. F. Fitchett.
E. J. Sheldon.
W. A. Bell.

Ambulance-driver Percy W. Moffat, who is known to all open competition riders and many readers as a consistent performer in the leading trials. His mount was a Douglas, and his principal performance was the winning of the Jarrott Cup in 1913. He is now driving a motor ambulance in France.

E. H. Dodds arrived from New South Wales last week, having paid his own passage home specially to enlist as a sidecarist-gunner in the Motor Machine Gun Service at 1s. 2½d. per day. At the outbreak of war he was a despatch rider to the New South Wales Government for a period of four months.

W. C. Comber, who during the last sixteen years has been in the service of the Duke of Portland, latterly as a chauffeur, enlisted in the M.M.G.S. as a car driver last week.

Last week's recruits in the M.M.G.S.:

J. H. Beasley (Birmingham).
J. C. D. Browning (Cullercoats).
C. S. Chalfont (Wembley).
H. A. Chitty (Clapham).
W. C. Comber (Worksop).
E. Didcote (Coventry).
E. H. Dodds (New South Wales).
A. Ellison (Wolverhampton).
W. J. Fitchett (Birmingham).
L. R. Gutsell (Shaftesbury).
C. W. Lister (Pudsey).
J. Lovatt (Coventry).
W. Price (Leicester).
A. Redding (Cambridge).
C. A. Reid (Whitley Bay).
G. S. Richards (Wembley).
J. R. Robinson (Chatburn).
J. M. Shotton (North Shields).
P. P. Simm (Cullercoats).
W. F. Sugden (Wernoth).
A. L. Warrender (Cannock).
E. G. Williams (Rhondda).

Only two were rejected by the doctor.

A dozen or so men are being selected for the M.M.G.S. each week from the applications received, in which should be mentioned age, height, experience, if medically fit, and when free to enlist.

Only experienced motor cyclists, preferably with sidecar experience, can be accepted at present.

The terms of enlistment in the M.M.G.S. are: Age, 19-38; enlistment for duration of war; pay, 1s. 2½d. per day, all found, usual separation allowance.

Applications, in brief, should be sent to the Editor, Mr. Geoffrey Smith, 19, Hertford Street, Coventry.

The next inspection is at the Coventry Recruiting Office, Masonic Buildings, on Wednesday next, the 17th inst., 2.30 to 4 p.m.

It may save needless correspondence if we repeat that the waiting list of despatch riders in the R.E. South Midland Divisional Area is now so long that no further applications should be sent in until further notice.

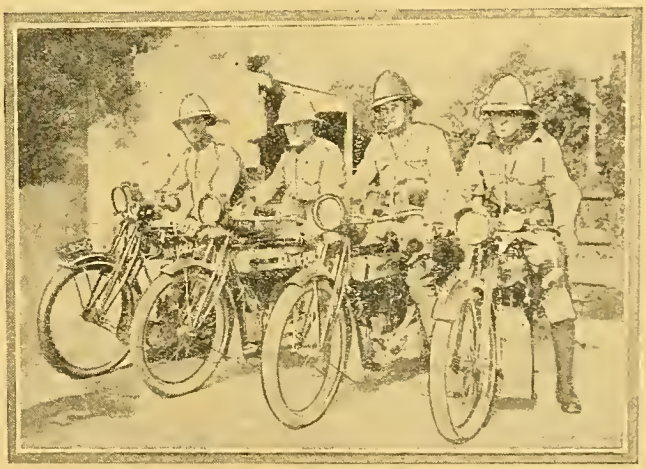
The newly-appointed secretary of the East Anglian Divisional Area is Capt. R. Wilson—Headquarters, East Anglian Divisional R.E., Ashburnham Road, Bedford—who asks motor cyclists in his district desirous of enlisting as despatch riders in the Royal Engineers to apply to him, as he has a definite call for ten motor cyclists per month.

Some of the riders attached to the Lowland Divisional Signal Company. Reading from left to right, the names are: Elkington (Douglas), Norton (Douglas), Allan (Douglas), Simpson (Bat), and Sutcliffe (Douglas)

A Sussex motor cyclist, writing on behalf of himself and a friend, says: "We are willing to enlist, but on making enquiries at the local recruiting offices have been met with such remarks as 'We are not recruiting for despatch riders,' and are given no advice how to proceed."

As these grumbles have become so frequent, we intend to repeat them until recruiting officers generally give advice to prospective recruits. The men referred to above have written to the editor appealing for particulars and advice how to enlist in a motor cycle section, and mention at the end of their letter, "We think you have done the country a valuable service, at any rate."

This is an example from one of many similar letters which we have received.



Four despatch riders, all hailing from Barnstaple, photographed preparatory to leaving for the Near East. The machines are two Triumphs, a Douglas, and a Sunbeam. We have to thank Mrs. P. Chanter, wife of Lance-Cpl. P. Chanter, for the original photograph.

The Whiting Spring Frame.

SEMI-ELLIPTIC SPRINGS APPLIED TO FRONT AND REAR.

JUST as *The Motor Cycle* persistently advocated the general adoption of the change speed gear, and so rendered the modern motor bicycle a go-anywhere, safe, and tractable mount, suitable for young or old, so has it worked equally hard to get the manufacturers to devote their attention to a properly sprung frame. For many years we have had spring forks, but it is not until recently that the question of rear springing has been studied. The result of our labours is beginning to bear fruit, and many makers are now going into the question carefully, so that as soon as normal times once more prevail the improvement in comfort will do much to popularise the motor cycle.

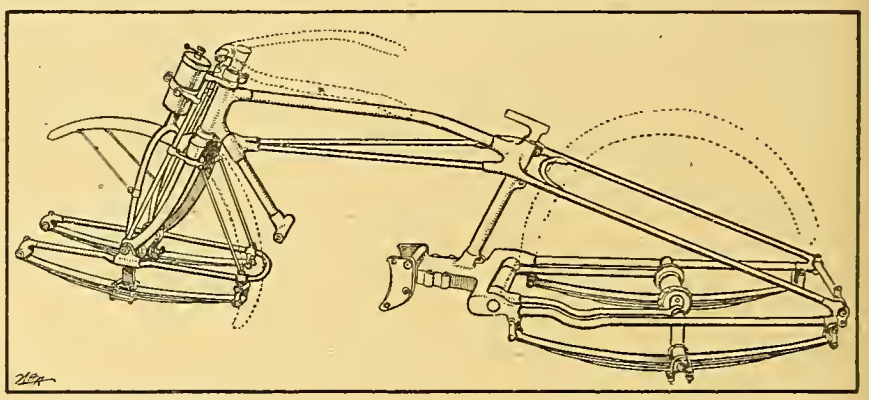
Not only is the properly sprung frame a real benefit in point of view of comfort, but beyond the comfort of the rider, valuable as this point is, other considerations have to be borne in mind, such as reduction in wear, greater ease of maintenance, and longer life for the tyres. Nuts will no longer become loose, and tyres will last much longer, if the frame and engine be adequately sprung.

The enormously increasing amount of heavy traffic due to the war has resulted in a serious deterioration of road surface, which is practically universal, and this state of affairs has made the demand for the introduction of spring frames even more necessary than it was before.

One of the latest devices of this kind owes its being to a clever Australian, Mr. Whiting, who in the early part of this year brought over one of his spring frames fitted with a Douglas engine.

Not an Untried Design.

It was clearly a success, and was favourably received by the few people whom the inventor and his colleague, Mr. Herbert Credgington, approached. This gave Mr. Whiting sufficient encouragement to build up a new and improved model, which we recently had the opportunity of inspecting. In his design, Mr. Whiting has adopted semi-elliptical leaf springs, wisely following automobile practice, and at the same time bearing in mind that this particular type of spring is smooth in action, almost devoid of rebound, and unlikely to break or give trouble. Not only in the springing, but also in the design of the frame itself, has a considerable amount of ingenuity been displayed. The frame gives a low riding position, is immensely strong, and is at the same time by no means heavy. The back forks are produced forward in a continuous line, so that they take the place of the secondary tube and terminate in a point at the base of the steering head. These two tubes are stayed by a substantial strut, and thus a triangle is formed giving great strength. The bottom bracket casting is specially designed to take the Jardine four-speed gear box, which is attached by means of bolts running through oval holes, thus providing means of adjusting the transmission chain. Alignment is preserved by the provision of a groove, along which the gear box slides.



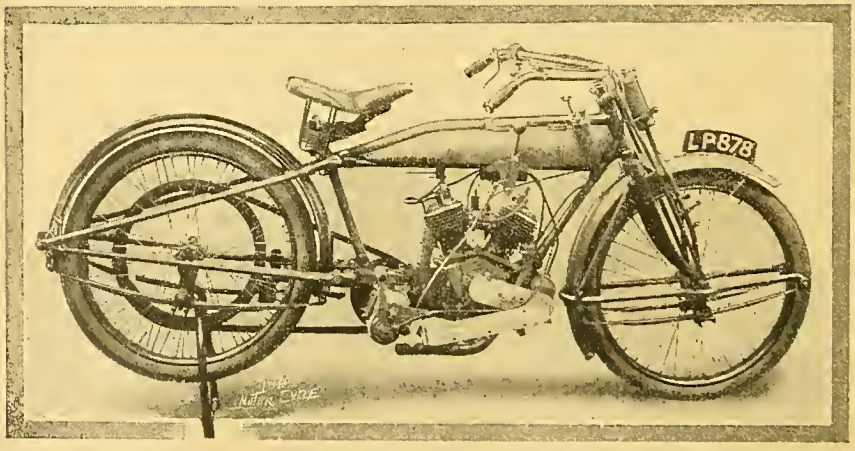
Showing details of construction of the Whiting spring frame.

This frame, we may mention, was built up by Mr. Whiting himself in the Midlands, is of entirely new design, and has not been previously described in any other journal. Turning first to the suspensions of the front wheel, it will be seen from the accompanying sketch that a V-shaped girder runs round the wheel, and is supported by stays on each side, extending from its rearmost end to the bottom of the fork crown. This girder serves as a form of attachment for the semi-elliptic springs which are provided with shackles at their rear. The upper part of the movable portion of the fork terminates in a dashpot arrangement, consisting of a phosphor-bronze piston working in a brass cylinder, which has a compression tap screwed into its top so that oil may be introduced from time to time. This device acts as an excellent shock absorber. The only unsprung portion of the frame is the short piece of mudguard to which the number plate is attached, and the manner in which it is bent up at the rear so as to prevent the oozing of mud and water on a wet day should be noted.

The Rear Springing.

Now, as regards the rear springing. The bottom bracket casting, which holds the gear box as it terminates in a fork, serves as a lug for the chain stays, and also acts as a support from the spindle on which the inner frame which carries the rear wheel moves. This is a device similar to that employed on the old Lagonda tricar, and serves to maintain lateral rigidity and to allow the wheel free vertical movement without altering the belt tension; thus the two arms of the inner frame act as radius rods, and are coupled directly to the centre of the semi-elliptical springs, which have shackles at each end. The spring clamps surround square blocks, which are pivoted at the base of the arms to which the wheels are attached, and so prevent jamming and allow the springs to work freely. Particular care has been exercised in the manufacture of the frame, and all moving parts, such as shackles, joints, and spindles, are provided with phosphor-bronze bushes.

The whole frame is ingenious, affords an excellent system of springing, and is



The Whiting spring frame as it looks when applied to a motor bicycle. The engine is a twin J.A.P., and the gear a Jardine.

The Whiting Spring Frame.—

not unsightly. The frame also lends itself readily to the attachment of a sidecar, and it is interesting to note that Mr. Whiting has the designs of a special sidecar in hand, in the frame of which the triangular method of construction is employed. Lugs are provided, by means of which the sidecar may be easily fixed to the rigid portion of the motor bicycle frame. The machine as a whole is thoroughly practical in every detail, and the specification is first class, such as a 4-5 h.p. J.A.P. engine, Jardine four-speed gear with chain-cum-belt drive, Best and Lloyd lubricator, and a capacious tank.

The interests of the Whiting spring frame are being looked after by Mr. Herbert Credgington, The Waverley Hotel, Southampton Row, London, W.C.

A Test of the Frame on the Road.

MANY spring frames appear to be efficient on paper, and yet in a road test do not come up to expectations, so to supplement the preceding description we gave the Whiting machines a good thirty miles run. Mr. Whiting being an Australian on his first visit to the Motherland, we took him down the Portsmouth Road, that favourite and historic highway from which Brooklands is but a stone's throw, so that he might see the famous track. He was mounted on the new model described in this issue, while for the first part of the journey we rode the original model fitted with a Douglas engine.

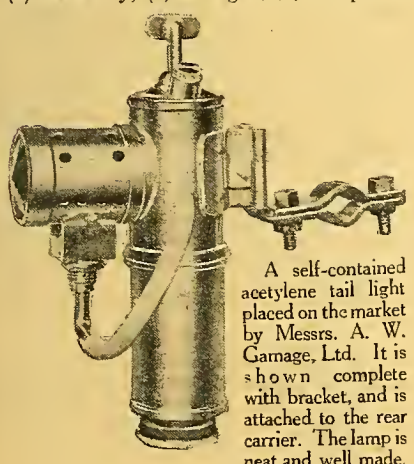
It was in Goodge Street where we first noticed the efficiency of the springing, as the surface is badly-worn wood, furrowed with sharp shallow pot-holes, which on a rigid frame motor bicycle are most keenly felt, but on the Whiting they were practically imperceptible. The next severe test was down Exhibition Road, South Kensington, at the bottom of which a steam roller was doing much needed repairs. We know this piece of road extremely well, and purposely made for every rough crossing or bad pot-hole we could find at a good smart pace. It only suffices to say that all road shocks were most efficiently absorbed, though when going over one very bad hole the front fork humped to its limit, owing to either the springs being a trifle light for our weight, or to the dash-pot not doing its duty. If the latter were the case, the matter can be easily remedied.

A good example of an ordinary rough road is that stretching from the Robin Hood Inn at the foot of Kingston Hill until the tramlines are reached. Here the value and efficiency of the springs were appreciated to the full. The machine was eminently comfortable, even though driven at a good speed, while the only effect of an excessively bad bump was a tendency to throw the rider off the saddle, which was not an unpleasant sensation, as the return was made without shock or jar. A circuitous route was purposely taken through Kingston, to find out how the machine would corner. We found that the motor bicycle would take corners at a good pace with absolute steadiness, and give the rider every sense of security, and this was undoubtedly due to an absence of side play. In the open country the machine was purposely driven fast, so that the springing might be adequately tested. The last severe test was the road from Cobham to Brooklands, which is in really bad condition. This was taken on the new 4-5 h.p. model, which we found excellent, though the springs were a trifle stiffer than those on the mount we had been riding. Altogether we were most satisfied with the Whiting spring frame, which certainly appears to fulfil the claims made for it by its inventor.

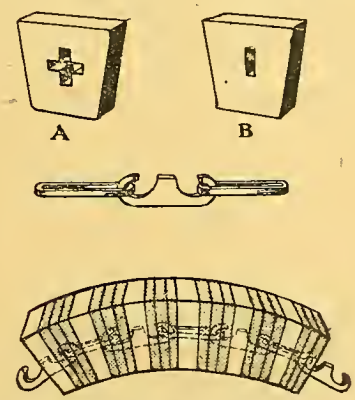
Road Test of Zilla Belt.

RECENTLY we have subjected a belt of the above-named make to a thorough road test, the machine on which it was tried being a 5-7 h.p. Abingdon of considerable vitality, fitted with belt drive from countershaft. Having now covered 1,000 miles with this belt, our riding being of the all-weather variety over mountainous roads, we are able to form some idea as to its merits compared with the rubber and canvas belts previously used.

It will be recalled that the Zilla belt consists of rubber and leather washers mounted alternately on a steel chain core, and the makers claim as its special merits (1) flexibility, (2) strength, (3) exceptional wearing qualities, and (4) exceptional gripping qualities.



A self-contained acetylene tail light placed on the market by Messrs. A. W. Gamage, Ltd. It is shown complete with bracket, and is attached to the rear carrier. The lamp is neat and well made.



The Zilla chain belt. A and B are leather or rubber blocks which fit over chain links. A fits over that part of the chain where the links join, and B over the centre portion of link.

When first the belt was fitted we certainly noticed a marked improvement in the transmission, there being no tendency for the belt to slip on sudden acceleration on up grades, but we could detect no traces of harshness in the drive, the pull being just as smooth as with the more elastic variety of belt.

The Zilla belt is considerably deeper than any other we have used, with the result that initial slack soon takes place as it beds down into the pulley. For some days we ran the belt much slacker than the makers recommend, but experienced no trouble with slip, and after the initial slack was taken up it kept its tension perfectly.

Extreme Flexibility.

As regards its wearing qualities we cannot speak too highly, and its flexibility is certainly a recommending feature, since it can be wound round a 1in. tube. The wear on the pulley may be slightly greater than with a rubber belt, but this is a negligible quantity. It does not slip in rain, but on crossing a watersplash every kind of belt we have ever used promptly relinquishes its duties, and the Zilla is no exception to this rule.

On account of its strength and its gripping qualities this belt is one of the most businesslike we have tried, and would appear to be specially suitable for high-powered sidecar machines with combination drive.

AN EARLY COMPETITION RIDER'S NEW ROLE.

MOST of the older competition riders will remember L. W. Bellinger, who figured successfully in trials and hill-climbs in the early days on Quadrants, and later on Indians when they were first introduced into this country, and with which firm he was connected for a considerable period. He is now a driver in the M.T. in France, where he has been practically since the outbreak of war.

CURRENT CHAT

TIMES TO LIGHT LAMPS.

Greenwich Time.

Nov.	11th	... ...	5.17 p.m.
,,	13th	... ...	5.14 ,,
,,	15th	... ...	5.11 ,,
,,	17th	... ...	5.8 ,,

In London half an hour earlier.

Thursday, November 25th.

A fortnight hence, the annual Buyers' Guide of *The Motor Cycle*, which this year will be illustrated, is due to appear.

Police Warning.

We understand the police are active in the neighbourhood of Ballycastle, so motor cyclists beware!

Motor Cyclists in the R.F.C.

Graham Price, a member of the committee of the Streatham and District Motor Cycle Club, who has been despatch riding in France since the early days of the war, has been granted a commission in the Royal Flying Corps. Lieut. Price may be remembered as an open trials competitor, his mount generally being a Bat.

Spare Valves for Two-strokes.

We wonder if the rumour is true that the War Office recently ordered a large consignment of spare valves for two-stroke Scott motor bicycles.

Military Douglas Stolen.

Gunner A. Dale, stationed at Shoreham Camp, has had stolen his 2¾ h.p. Douglas. Engine No. 20906, gear box No. 17441, frame No. 20510, registration No. HC 832. A reward is offered to anyone giving information to the police likely to lead to its recovery.

Coventry Club Suspends Activities.

Owing to the fact that practically every member of the Coventry and Warwickshire M.C. is either on military service or munition work, the committee has decided to suspend the club temporarily, as from the end of the present financial year, *i.e.*, December 31st.

From the Gallipoli Peninsula.

Corpl. A. J. Sproston, a well-known rider and trader, who has been on active service since the beginning of war, is now in the Dardanelles. A postcard from him dated September 15th only came to hand last week, so he may have been moved since. Sproston says that at present the use of their motor cycles is very limited owing to absence of roads.

Some Recent Balance Sheets.

The Triumph Cycle Co. are paying 6½% on the preference shares, 20% on the ordinary, and a 10% bonus.

Rudge-Whitworth, Ltd., are paying a 10% dividend, and putting a sum of £20,000 to reserve.

Rovers are likewise paying a 10% dividend. They are placing £30,000 to reserve, in addition to £7,500 to the fund for employees' dependants, and £10,000 to plant reserve fund.

AT A WESTERN AUSTRALIAN RACE MEETING.

The Goldfields Motor Club at certain times of the year use the dry bed of a lake near Kalgoorie for racing purposes. It provides an excellent surface, and the photograph was taken on the lake bed. The riders shown, H. Myers (B.S.A.) and A. V. Norton (Sunbeam), are successful W.A. competition men.

Severe Test for Machine Gun Sidecars.

Whereas the Triumph and Douglas machines intended for the use of despatch riders in the Royal Engineers Signal Section are (apart from the works test) given an extremely short test on the road before being taken over by the Government, it should be of interest to know that every Clyno motor machine gun sidecar outfit which is produced is given a hundred miles on the road by a works tester before being submitted to the Government Inspector, and subsequently every machine is given a further hundred miles test accompanied by the inspector. The fact that the runs take place in all kinds of weather adds severity to the trial, and such a testing should be the means of weeding out any single machine which may not be up to standard.

New Models.

Many 1916 models have been described in *The Motor Cycle* during the past few weeks, and for convenience of reference we give below an alphabetical list showing the dates on which these descriptions have appeared :

American Excelsior 7 h.p.	..	October	7th, page 346
Ariel 3-speed gear	.. ..	September	30th, page 316

Imports and Exports.

The Board of Trade returns show that in October there was a drop in the imports and an increase in the exports of motor cycles over the previous month's figures. The new import duties came into effect on September 29th, and, though it is too early to gain an accurate idea of their effect the drop in the number of machines is worth noting. It is satisfactory to note the recovery of the exports, though this is still far behind what it was in the day before the war. We cannot expect any big increase in the number of British machines exported so long as the principal manufacturers are engaged on munitions. The actual figures are :

Imports.

October, 1915.—314 motor cycles, value £13,888 (complete with parts and tyres not imported with complete machines, £23,161).

September, 1915.—437 motor cycles, value £20,859.

October, 1914.—280 motor cycles, value £12,144.

Exports.

October, 1915.—880 motor cycles, value £38,257 (complete with parts and tyres not exported with complete machines, £64,825).

September, 1915.—637 motor cycles, value £28,847.

October, 1914.—1,124 motor cycles, value £50,982.

The Dangerous Dog.

A fatal motor cycle accident occurred at Leek Wootton, between Kenilworth and Warwick, one evening last week which was directly due to a dog. A sidecar outfit was passing through the village in question when a dog rushed across the road, colliding with the outfit with such force as to overturn it. The lady passenger suffered a fractured skull.

Presentation to a Motor Cyclist S.C.

Of the motor cyclists who are enrolled as special constables, under the ægis of the Automobile Association, a squad of fifteen are on duty each night at Fanum House. The Wednesday night squad is in charge of Sergt. F. A. Hardy (of the Motor Cycling Club), and so popular has he become with his men that they have presented him with a silver cigarette case.

The National War Funds.

At the week-end the principal relief funds stood as follow :

The Belgian Relief Fund	£1,060,000
The Queen's Work for Women Fund	166,756
The Times Fund for the Sick and Wounded	1,854,204
Weekly Dispatch Tobacco Fund ...	88,239
Daily Chronicle Christmas Gift Fund	7,009

Cork and District M.C.C.

The Cork and District Motor Cycle Club recently held its annual general meeting at the Imperial Hotel, Mr. Frank Daly presiding. The secretarial and financial reports presented were both of a satisfactory character, and the events of the year were well supported, despite the fact that twenty-five of the members of the club had joined the Colours. The new officers for 1916 were elected as follows: President, Mr. Frank Daly; hon. sec., R. S. Russell, 4, Prince's Street, Cork; asst. hon. sec., F. L. Deely, 68, South Mall; hon. treas., H. P. Debbin, King Street.

Paraffin as a Fuel.

A reader who has persevered with paraffin for his motor cycle, adding a quart to three quarts of petrol, suffered from knocking in his engine. The makers of his machine gave a remarkable explanation which frightened the owner of the machine. The paraffin, according to the works' representative, does not burn completely in the cylinder, but runs down the sides past the piston and thins the lubricating oil. This process continues until the oil in the crank case has lost its lubricating properties, and, as a result, the bearings begin to wear. Has any other reader an experience to confirm this? We hardly like to suggest that the explanation struck us at first as a very ingenious excuse for rapid bearing wear.

More New Models in this Issue.

Continuing our descriptions and illustrations of 1916 model motor cycles, in this issue we deal with the following well-known makes of British motor cycles, the illustrations and descriptions being mostly exclusive to *The Motor Cycle* as usual :

Scott Two-stroke, page 466.
New Ryder, page 465.
Nut-Jap, page 465.
Watsonian Sidecars, page 465.
1916 Enfield, page 465.
L.M.C. 6 h.p. Twin, page 465.

In addition to the above, we outline the programmes of the Rudge, A.J.S., and other companies who are making no change for 1916, and describe and illustrate the latest Whiting spring frame motor cycle, as well as the Berge—the latest Italian product.

Kent Lightweight Tour this Week-end.

It has been decided to run the Kent hill tour for lightweights on November 14th, meeting at Green Street Green at 11 a.m. After a tour round on a Clyno two-stroke, the organiser, T. J. Ross, of the Woolwich Club, reports the roads in fair trim.

Average Prices

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model, the average for the past week is quoted. If there were not at least two advertisements, then the last occasion on which they were quoted is given.

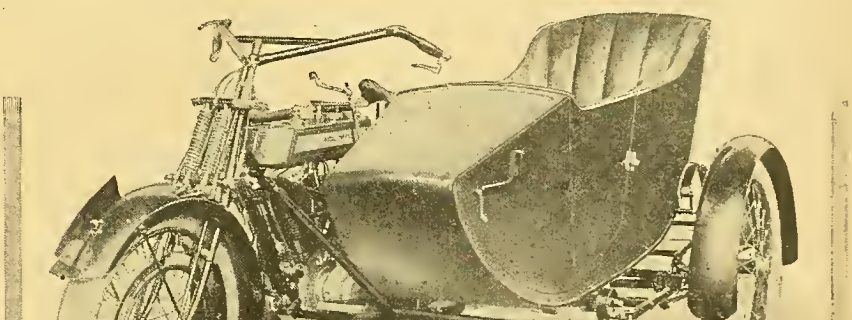
120 Petrol Tins Wanted.

We have received an appeal from a medical officer for 120 two-gallon petrol cans, to enable the men of his unit in the trenches to be supplied with drinking water. Empty tins should be sent by parcel post addressed to the Medical Officer, 2nd Black Watch, Bareilly Brigade, Meerut Division, Indian Expeditionary Force, A. If the sender encloses his or her name and address an acknowledgment will be made. Readers who send tins will be rendering services that will be felt immediately right in the front line trenches.



Next year's 6 h.p. passenger model Enfield. This is the Colonial model, and a feature is the good ground clearance of the crankcase. (See next page.)

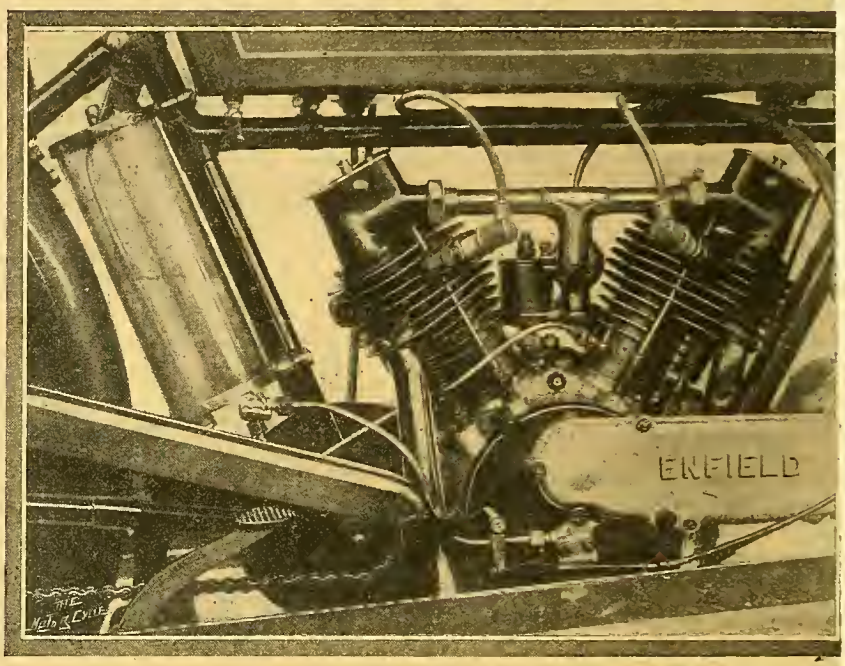
Royal Enfield 1916 Models.

Chain Drive Throughout; Enfield Two-speed Gear.

LIKE many other of the larger manufacturers, the Enfield Cycle Co., of Redditch, has been engaged to a great extent on Government work, and has also been supplying motor cycles to the Russian and Belgian Governments; thus, we must not expect to find any radical departures from this year's specifications, but detail improvements have been made where it has been found necessary.

To take the several models in order: The 2¼ h.p. (64 × 70 mm., 225 c.c.) two-stroke has proved so satisfactory that no alteration has been needed. It is supplied as before with the Enfield two-speed gear, which embodies a slipping clutch—an item found on only a few baby two-strokes—cush drive, and chain transmission, but owing to war conditions the price has been advanced to forty guineas.

The frame and forks of the 3 h.p. (60×75 mm., 425 c.c.) model are now of extra strength, and are on the same lines as those formerly supplied for Overseas use. The principal alteration lies in taking a supply of oil direct to the front cylinder, this supply being controlled by a tap close to the cylinder. The shape of the inlet pipe has been modified, so that the carburetter lies snugly between the cylinders, where it is kept nicely warm and at the same time quite accessible. This model is supplied as an ordinary roadster or a T.T. model, both at the old price, viz., 50 guineas. The latter can be fitted with special light mudguards, or the standard guards, which are well valanced, and footboards or footrests. These few improvements should add to the value of a machine which we know from experience to be excellent.

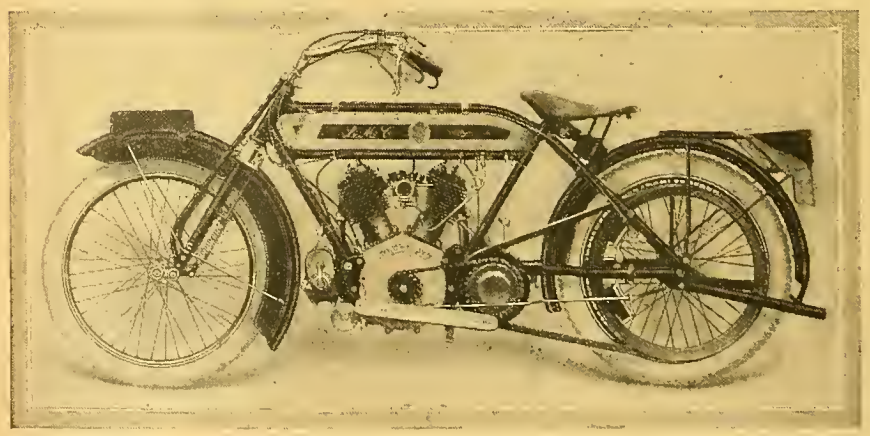


Engine of the latest 3 h.p. Enfield, showing new induction pipe design, and oil pipe leading direct to front cylinder with tap for turning oil on and off

The sidecar combination remains practically as heretofore, but the front brake now operates on a special brake drum fitted to the wheel, which makes the wheel quickly detachable, and is powerful in action—a valuable point on a sidecar machine. The sidecar is built and upholstered throughout by th Enfield Co. The price of the 6 h.p (76×85 mm., 770 c.c.) models has bee advanced to 85 guineas, or 100 guinea including a Lucas dynamo lighting s and Lucas horn. An 8 h.p. engine ca be fitted at an extra cost of 2 guineas.

The 6 h.p. L.M.C. Twin.

FOR 1916 the Lloyd Motor Engineering Company will concentrate its attention upon the 3½ h.p. single-cylinder L.M.C., which has an engine of 85 × 88 mm. = 499 c.c., and the 6 h.p. L.M.C., which has a twin-cylinder engine of 79 × 86 mm. = 842 c.c. Whereas the 3½ h.p. mount is well-known to our readers by reason of its outstanding performances in the different trials when ridden by L. A. Bees (who is no with the Motor Machine Gun Service the new twin-cylinder machine has nc been heard much of, mainly on account c the war putting a stop to the manu facturers' proposals in connection wit this new mount. Nevertheless, we ar able to illustrate the finished design, an it will be noticed that the engine, whic is to the design of Mr. W. J. Lloyd, i of the side-by-side valve pattern, lubri cated by drip feed. An Amac carburette is used, and a sensible sized petrol tan (having a capacity of two gallons) wi please the long-distance tourist. Th transmission is of the combined type, i conjunction with a Sturmey-Archer three speed countershaft gear. In the illustra tion the case enclosing the front chain ha been removed.

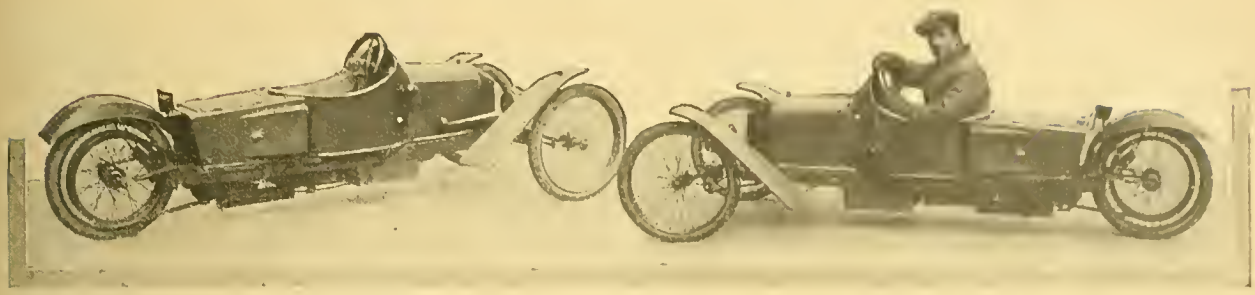


The 6 h.p. twin-cylinder 1916 model L.M.C. The chain cover was removed when the photograph was taken. A feature of this machine is the location of both brakes on the belt rim.

It will interest our Overseas readers t know that the ground clearance of th L.M.C. is 5½in. in combination with 54in. wheelbase, whilst the standard siz of tyres is 650 × 65 mm.

The 6 h.p. twin L.M.C. is a sound strongly built machine, retailing at £74 but the firm has never yet been in position to satisfy the demand, for th reasons stated above.

AN INGENIOUS MONOCAR.



The Binns three-wheeled monocar—a rakish looking home-built machine described on this page.

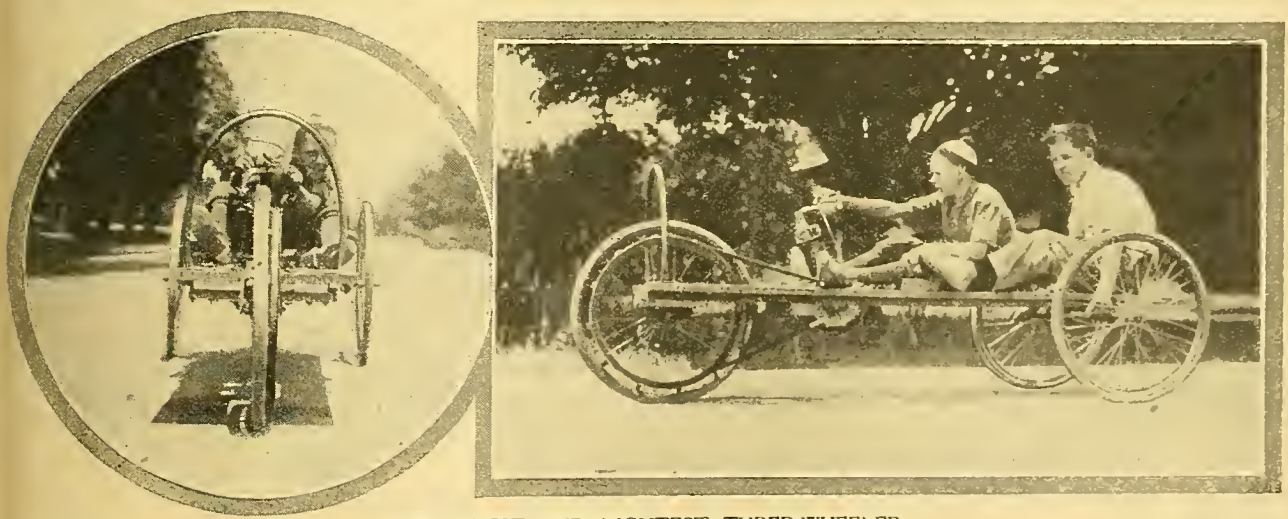
IT is not often that much enthusiasm can be aroused by a three-wheeled runabout built by an amateur, and we may frankly say that it is exceedingly rare to find such ingenuity displayed in the construction of a vehicle of this type as is the case with the runabout illustrated on this page. It has been built by Mr. P. J. Binns, of 87, Blackfriars Road, S.E., in his own workshop.

It has an ash frame, at the rear end of which the 8 h.p. J.A.P. engine is fitted tandem fashion. Underneath the seat there is a three-gallon petrol tank, while the dummy bonnet in front contains a tank holding one gallon of lubricating oil. The petrol tank, owing to its position, has to feed the fuel to the carburetter under pressure, and this is accomplished by blowing down a rubber pipe, at the end of which there is a tap. After the owner has given a good hearty blow down the pipe the pressure is maintained by the engine, the crank case compression being used for this purpose. The system is exceedingly simple, and works well, as pressure is maintained by the aid of two ball valves. Further, pressure is maintained for quite threequarters of an hour after stopping, and even if pressure has escaped and there is sufficient petrol in the carburetter to start the engine, pressure is again raised by the engine itself.

The lubrication is through a drip feed on the dash, the oil being supplied to the engine by crank case suction. The little dashboard contains a watch and switch, the latter allowing the two side lights, tail light, and dashboard light to be lighted, or the tail light only. Practically every part of the vehicle was made by Mr. Binns himself, including the lamps, and the side lamps especially are most ingenious, being manufactured out of bedstead knobs. Having no external wiring, their appearance is exceedingly neat.

The illustrations show on the left of the vehicle the hand-actuated clutch, which is also foot controlled. To start the vehicle, which is single geared, the clutch lever is pressed forward, the exhaust lever on the half steering wheel is depressed, and the cable starter smartly pulled up, when the engine fires, usually on the first pull, and the driver then takes his seat. On his depressing the clutch pedal the clutch hand lever flies back into its normal position. The clutch itself is 7in. in diameter, and is of the cork insert pattern.

The drive is by chain and belt. The carburetter is of the pilot jet type. The sparking plugs may be removed and various adjustments effected to the engine without removing the bonnet; and even the compression taps can be opened and petrol injected through lubricators, from which the copper pipes run down to the compression taps, these lubricators being situated on the outside of the bonnet. The chassis is suspended on quarter-elliptical springs fore and aft.



THE LATEST AND LIGHTEST THREE-WHEELER.

A Californian youngster is responsible for this buckboard, which is built up with three pedal cycle wheels, a motor cycle engine, and a few odds and ends. Drive is by belt direct from engine to front wheel and steering is by the back wheels, though how we are not in a position to say.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Reversing a Scott.

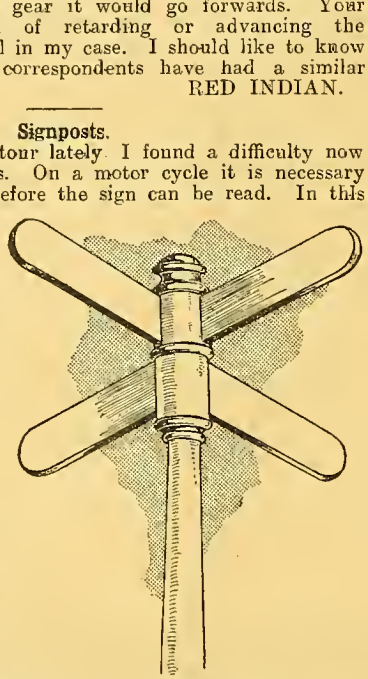
Sir,—I read with interest the account of a Scott reversing in your issue of October 28th, as the one I had formerly would reverse. It was a 1915 model fitted with a Splitdorf magneto.

It would reverse most unexpectedly, as, often after kick starting, when the low gear was gradnally let in, the machine would go backwards. I then used to stop the engine, and turn it over against compression. On kick starting again and letting in the low gear it would go forwards. Your correspondent's method of retarding or advancing the magneto was of no avail in my case. I should like to know if any other of your correspondents have had a similar experience. RED INDIAN.

Signposts.

Sir,—During a short tour lately I found a difficulty now and then with signposts. On a motor cycle it is necessary in some cases to stop before the sign can be read. In this case, if two of the arms were placed lower as shown there would be no trouble. As it is, they are made invisible by one another. At times they are a puzzle, and speed is lost examining them. Thanking you for past help,

$2\frac{3}{4}$.



The Modern Motor Cycle Engine.

Sir,—I was much interested by the contribution of A. Worsdale, but some of his criticisms strike one as unjust. He condemns the side-by-side valve arrangement, but offers no suggestion as to how this is to be improved. If overhead valves are adopted it introduces the complication of rocking levers and the supports, which will interfere with the free expansion and equal cooling of the cylinder head. Also the inertia of the operating mechanism is greater. I agree with him regarding making the tappet rods in tension instead of compression, but this might add complication.

Now for his big criticism—the cylinder. He remarks it is a masterpiece of design to use cast iron in tension. If he refers to any other prime movers he will still find this masterpiece of design still in evidence. And admitting cast iron is not the best of metals in tension, what alternative has a designer? Steel is such a difficult metal to cast without getting spongy places. Also he says that radiating fins are cast parallel; but this is not so, or the pattern would not draw from the sand without breaking down the mould.

I certainly think aluminium is not the best metal for crank cases, as the crank case forms the bed and support for the cylinder, besides being an important member in the frame. I consider that crank cases might well be pressed up from steel. I will close by remarking that it is easy to criticise, especially destructively, but difficult to suggest improvements.

B. CUTLER.

"Deserving of an Iron Cross."

Sir,—I have been looking for a reply to C. E. Thomas's letter under the above heading in *The Motor Cycle* of October 14th. To me his statements have proved that the Douglas was not ill-treated. It got three pump charges every morning for the thirty miles to be covered on a business trip. The machine has been ridden thus five days a week, and at 150 miles per week it has covered, say, 15,000 miles in close on two years, and is in a "fair condition." Yes; because it got ample oil. True, the rider put in too much oil at a time, and was thereby liable to have sooted plugs, etc.

Before the days of drip feeds ninety miles to one pumpful of a special oil were quite the rage, and engines did not suffer. Possibly the Editor can tell us again about the expert who, some years ago, did a big mileage without adding oil to his engine *en route*. I have forgotten the details of this successful experiment.

Now, the rider who puts in three pumpfuls of oil before doing thirty miles is better able to preserve his engine than those (and there are many) who at times fail to keep the drip flowing.

I believe the Triumph Co. have discarded the drip feed system for the old direct pump. Why? Not the fault of the system, but the average man behind it.

A rider with the experience of having covered 15,000 miles successfully within two years on the same motor cycle must know a little about the oiling his engine requires, and I say he is to be congratulated and not condemned. W.H.

[It is true that a rider was once reported to have ridden from Coventry to London without oiling his engine *en route*, under the observation of a contemporary, but we do not know why he did it, or the condition of the engine bearings at the finish.—ED.]

Spring Frame Design.

Sir,—I have examined with great interest the illustrations of spring frames in your issue of October 21st, and whilst I cannot but admire the ingenuity displayed in the various designs, let us hope that they are as efficient as their makers intend them to be.

Leaving out of the question front wheel springing, I prefer that the back wheel alone should have the spring movement, and that the carrier should be firmly fixed to the frame of the machine.

Judging from your illustrations the carriers of the Douglas, Matchless, Van Geert, and A.B.C. are fixed more or less firmly to the back wheel spindle attachment, and would share the vertical movements of the back wheels of the machines mentioned, the Indian being the only carrier fixed to the main frame.

When the weight of the rider is in the saddle of the Indian and A.B.C. the back springs naturally come into play, and the main frame is forced down somewhat, say, 1in.; the pivotal centres of the back wheel and chain driving mechanism respectively remain almost constant in relation one to the other, but with the Douglas the tendency is for the back wheel centre to become further away from the belt pulley centre, thus stretching the belt very considerably. Should the Douglas springs allow of a vertically inclined movement of the back wheel 2in. upwards, the belt would be called upon to stretch $\frac{1}{4}$in. top and bottom, total $\frac{1}{2}$in., by reason of the relative position of the countershaft pulley and the pivotal centre of the back forks. I may be wrong.

but I have worked the movement out to scale, and cannot see where I have erred. I, however, hope the mistake is mine.

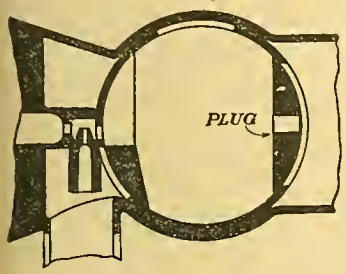
To make my meaning clearer, the more the Douglas is loaded (including bumps from pot-holes and other obstructions on the road), the further does the back wheel belt rim get from the countershaft pulley. Moreover, I should imagine that the inevitable flapper on the carrier would have a somewhat bumpy time. Perhaps Messrs. Douglas Bros. will assure us that this is not the case.

To my mind, the only possible method of keeping the back wheel the same distance from the countershaft when back wheel springs come into play is to pivot the back forks on the axis of the countershaft pulley. This could easily be done, but the modern practice of squeezing the back forks to almost a point would have to be departed from.

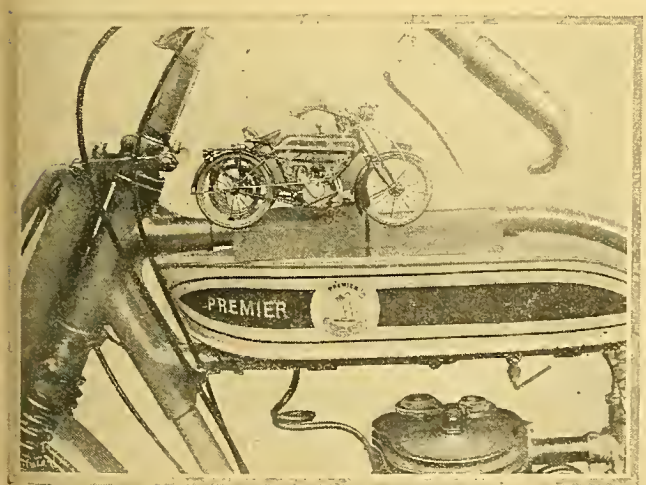
C. A. FORBES.

Easy Starting.

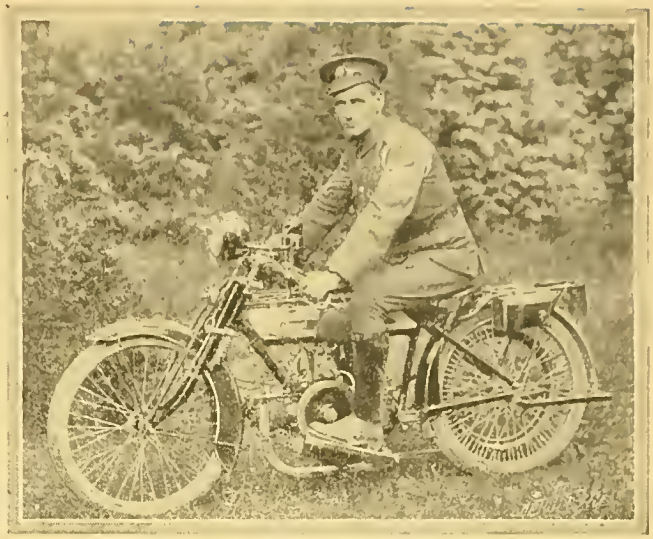
Sir,—Your readers may be interested in a small alteration I have effected to a Senspray carburetter fitted to my 3½ h.p. Rudge-Multi and sidecar. I have found it quite satisfactory as regards power and acceleration, but there was a difficulty in starting and running slowly. As my machine is a T.T. model—no clutch or kick-starter—both these qualities were desirable. Therefore, I drilled a $\frac{5}{76}$in. hole in the throttle valve next the engine, so that when the throttle was shut the hole was in centre of the inlet pipe. I then tapped this hole, and screwed into it bushes having various sized holes through their centres. I found that a bush having a $\frac{5}{32}$in. hole gives an immediate and unfailing start and really slow running. You will see that with this arrangement there is a tremendous suction on the jet at even the slowest speeds, provided the throttle is shut and air slightly open. It is impossible to get this suction to the same degree with the carburetter unaltered, as the air is opened at the same time as the throttle. I am enclosing a rough sketch, which will make the idea clear.



J. DOUGLAS.



A model of a Premier 3½ h.p. sidecar outfit mounted upon the tank of the original. With the exception of the wheels the model was made from scrap pieces of metal. The model, which has been made by Mr. J. Coles, of Westgate-on-Sea, has an overall length of 8½in., and the sidecar is a model of the Canoelet.



18,757 MILES WITHOUT TROUBLE.

Sergeant-Major Wilmore, of the A.S.C., and his Brough motor bicycle. The owner reports having covered 18,757 miles of military despatch work on this machine, and mechanical repairs have cost nothing.

The Lady Motor Cyclist: A Protest.

Sir,—I have read with interest in last week's issue of *The Motor Cycle* the protest as regards the dress of some lady motor cyclists, and I am pleased to see this serious state of affairs being taken up in the right way. It is true that of late we have seen some frightful illustrations of ladies in the press (thanks not in *The Motor Cycle*), some of them wearing riding breeches, other times they hold themselves up to the public ridicule wearing a suit of gentlemen's overalls, whilst one lady was actually standing on a gentleman's machine performing acrobatic tricks with her feet in the air—almost standing on her head—and to have this sort of thing thrust before the public gaze is most degrading and certainly does injury to the pastime. If a lady is to lose her self-respect in this way she should not make a public exhibition of herself, and if she cannot do the pastime any good, well, she should not do it any harm, for it is just this sort of thing that causes many who hitherto were contemplating joining our ranks to give up the idea in horror and disgust. It should be the aim of our sisters to look at all times neat, graceful, and feminine, not bold, mannish, and, shall I say, "slightly touched."

It is not necessary in any way for a lady to wander away from the ordinary walking costume for the purpose of riding a motor cycle, as to-day we have many different makes especially designed for "our" use. These we can get suitable for all riders, and there is no need for a lady to adapt herself to a machine which has been made for her requirements.

I appeal to the press to reject any photographs in future of "the lamb in wolf's clothing," and once this nonsense has died a natural death, aided by public ridicule, then the pastime will be largely taken up, and our friends will look forward to an outing with us just as in the days of the push cycle, and very shortly it will be "the fashion of the future."

It is ten years ago since I took to motor cycling, and I have always advocated an open frame, so that I could sit my steed with gracefulness and always look womanish.

MARY REID.

THE MOTOR CYCLE

BUYERS' GUIDE OF 1916 MODELS.

THURSDAY, NOVEMBER 25th!

This issue will be considerably enlarged and will contain an illustrated review of the various new pattern motor cycles.

Petroil Lubrication.

Sir,—I noticed a letter in *The Motor Cycle* for October 28th from a Connaught rider condemnatory of the "petroil" method of lubrication for two-strokes and recommending the substitution of another system in this machine.

Though the writer of this letter does not say what his troubles were, I feel that I must write to say that my experience of this machine and method of lubrication are such as to make me perfectly satisfied with both, and I cannot conceive of anyone fitting another lubrication system to this machine unless from a natural fondness for fitting "gadgets."

I have used a standard Connaught three-speed machine with sidecar since July, 1914, and this year toured with a 10 stone passenger (I am 12 stone myself) from Buckinghamshire to Scotland and *viâ* Dumfries to Stranraer, crossing over to Ireland, taking the Antrim coast road, and visiting Portrush, the Giant's Causeway, etc. This October I have toured with the same passenger from here (Stone) to Bodmin, Cornwall, taking the difficult road to Moretonhampstead and across Dartmoor, *via* Two Bridges, to Tavistock, Gunnislake, and Callington. With some occasional foot slogging the machine was able to ascend practically every hill. This serious touring would surely test any method of lubrication. However, since my return, I have had the cylinder off, and found everything in good order and apparently well lubricated. The exhaust ports had some deposit, and were scraped, but this was to be expected, as it had only been done once before.

The other week I fetched friends from the station three and a half miles away and a steady rise. These were a well nourished gentleman on the carrier, his wife and child in the sidecar, with a huge portmanteau across them in front; total 42 stone up.

Is it to be wondered at that I see little wrong with "petroil" or the proportion I use of 1 in 14?

(Dr.) T. S. LOGAN.

Ladies and Motor Cycles.

Sir,—Just lately I have seen illustrations of lady motor cyclists in *The Motor Cycle* which have caused me to make up my mind to drive. At first I felt rather nervous, as I thought the gas, air, spark, clutch, oil, gears, brakes, etc., were so much to remember that I should not be able to stop when I wanted to, but now I think it is lovely (my husband says he likes it in the sidecar). I enclose photograph of our Premier outfit.

MAY OTTON.

Mr. and Mrs. Otton, of Castle Cary, and their 3½ h.p. Premier sidecar outfit.

Dimming Bright Lights.

Sir,—As a matter of interest to your readers who have electric lamps fitted on their motor cycles, I note that the usual method of compliance with the Government lighting rules is the obscuration of the glass front of the head lamps. I have often wondered at the impractical and extravagant method of obtaining this light diminution, and would inform your readers that the best method at which they can attain the reduced lighting, and at the same time attain proportionately reduced current consumption, is by having a bulb of higher voltage inserted in the lamp. As an example, my firm (Ward and Goldstone) are providing a special 7½ volt bulb for 4 volt head lamps. The 7½ volt bulb in a 4 volt head lamp gives a red light sufficient to comply with the conditions for road lighting, and also the regulations as to volume of light.

The convenience and economy gained by using this method of light reduction are remarkable. For example, the Volex Giant dry battery lights the 4 volt head lamp bulb for about eighty hours in ordinary use, but when this special 7½ volt bulb is used upwards of some 200 hours of light are obtainable.

M. W. GOLDSTONE.

A Novel Three-wheeler.

Sir,—I recently saw in Bedford a very natty little three-wheeler with the wheels as on a sidecar outfit. What fascinated me was the neat War Office green finish, which was remarkably smart and workmanlike; also the very silent engine, which showed wonderful speed and acceleration. I think it was a horizontally-opposed twin, or two-stroke, or both. I did not care for the position of the wheels if it were to be designed as a complete chassis (as opposed to a bicycle and sidecar), but it overcomes the objection of the three tracks, and also brings it into direct comparison with, not the 8 h.p., but the 4 h.p. sidecar outfit, as it looked no heavier or more elaborate than something like a 4 h.p. Douglas with a wide and very low sidecar, but no handlebars, saddle, etc., and I think the petrol tank at the back. I do not think it is the same as the two-seated sidecar outfit steered from inside, which I think was called the H.S.M.

Could you tell me the name and power and price of this little "'bus," if you happen to know? I meant to explain that there were two, both brand new and driven by mechanics, and that they were registered AM.

I am just leaving for the Dardanelles, and would like to hear the name of this little vehicle if you can tell me.

R. F. MEREDITH (Lieut.)

[Doubtless our correspondent met with two of the new Scott three-wheelers described in our last issue, as they are now being tested by the War Office authorities.—Ed.]

A Trial for Armlet Wearers—A Proposal.

Sir,—I read with interest in the daily press that khaki armlets are to be issued to men who are either unfit for service, or who have been invalided out of the Army.

We have had of late trials, races, and hill-climbs for special constables, munition workers, the Army, and the Navy. Why should we now not have these for wearers of the armlet?

I received a commission in August, 1914, and was invalided out of the Army in January of this year, but I am able to ride a motor cycle. I was not allowed to compete in the Army events, as I am not entitled to wear uniform, and neither am I eligible to ride as a munition worker or special constable.

There must be many others like me, and also a great number of motor cyclists who have been refused service.

I therefore write to ask you to organise, if possible, a trial or trials for armlet wearers *when* we get our armlets. I see no reason now why open trials should not be run—even the hardy Bristol M.C.C., which ran its New Year and Easter open trials this year, in both of which I competed, has bowed before the storm, and has decided not to run its Land's End trial this winter.

Surely the manufacturers would now support an open trial, provided that entrants had to be armlet wearers, for are not many of our experts unfit for service?

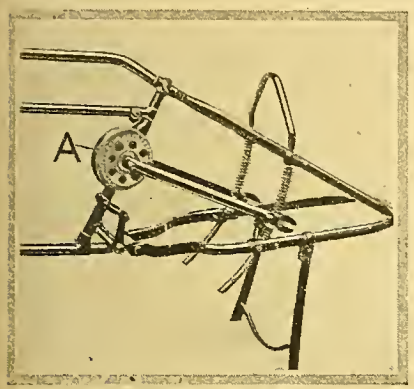
I hope this letter will catch the eye of some sporting club secretary, who will provide the trial asked for, against which there can be no objection of any sort.

E. RIDER TROWARD.

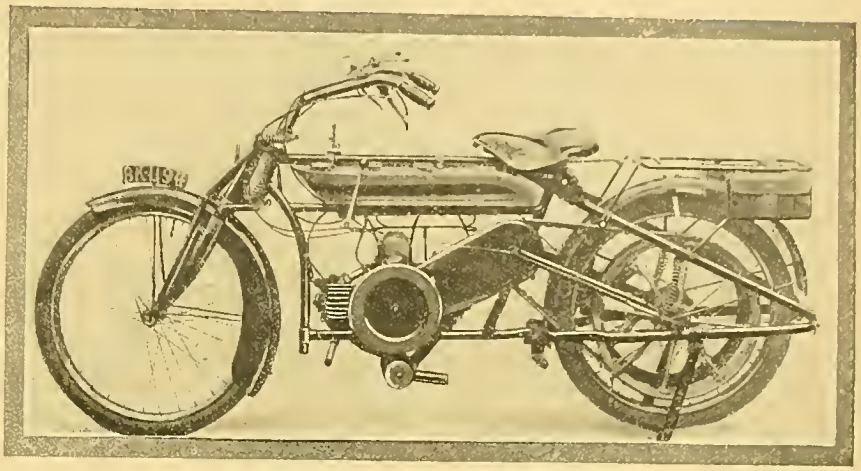
The Morley Spring Frame.

A Despatch Rider's Attempt to Solve the Rear-springing Problem.

A RATHER novel rear springing device has been patented and adapted to a Douglas motor cycle by Mr. E. W. Morley. The rear portion of the bicycle frame has been extended in order to form a substantial support for the springing portions. An additional pair of chain stays are inserted to carry the wheel, and are attached to the main frame at the point A in the smaller illustration, where they are hinged. The countershaft pulley is also mounted at this point in order that the distance between the pulley centres shall not vary, and also that the angle of movement of the wheel shall be the best for reducing as far as possible the strain on the radius rods.



The Morley spring frame



Douglas machine fitted with the Morley spring frame.

The springing is obtained by supporting the ends of these radius rods on two coiled springs. The stays are prevented from moving sideways by inserting two curved supports upon which the stays slide in bronze bearings. These supports also form guides to keep the springs in position. Two small springs are fitted under the stays to take up any recoil.

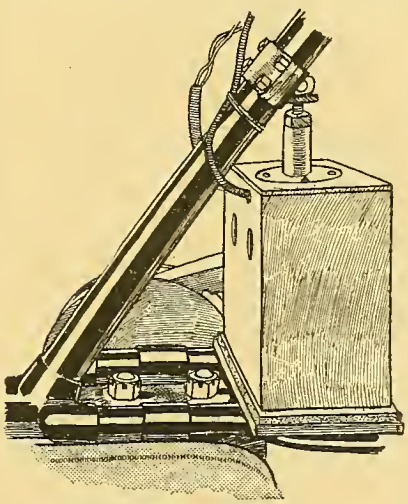
It would appear as though these sliding members would be considerably affected by mud and wet, while it also seems as though the position of the countershaft renders the belt extremely short, and we should think it would be apt to get in the way of the rider's legs. We are told that this frame has been thoroughly tested over the very worst roads in both England and France, and has proved most satisfactory.

How to Carry an Accumulator.

Two Excellent Ideas Neatly Carried Out by a Practical Motor Cyclist.

WHILST we were on a recent visit to Messrs. Brown and Barlow, Ltd., Mr. Evans, the works manager, showed to us an extremely interesting gadget for securing the accumulator in place on his New Hudson. As is usual with machines owned by enthusiasts, the device is by no means temporary, but, on the contrary, is substantial and well thought out, being so arranged that there is no possibility whatever of acid jumping out of the accumulator, spreading over the case, and ruining the padding used to prevent rattling. The accumulator is bedded down on a thick rubber sheet, and is held rigidly in position by a bar of wood lined with more rubber, the whole being pressed down by the lid of the tin box enclosing the accumulator.

As can be seen from the sketch, this tin box is mounted on the bottom bracket of the machine immediately behind the securing nuts of the gear box, there being a wooden platform held in position between the two tubes to which the gear box is attached, and on this platform yet another thick rubber pad, the wooden platform and the pad being kept in position relative to one another by small pegs. Upon the rubber pad goes the metal accumulator box, whilst on the seat tube of the bicycle is a small adjustable clip having a lug to which is attached a short screw with a clamp end, adjusting nut, and locking collar. The clamp end fits down upon the lid of the accumulator box, which then is pressed down hard upon its rubber pad by the adjusting screw, and the whole locked in position by the lock nut shown. Wires go through holes drilled in the side of the metal box, are carried upwards to a switch below the saddle, and then taken along the top tube of the bicycle to a small car side lamp mounted in a bracket as a motor cycle head lamp. The switch had to be placed in this position owing to the mischievous nature of small boys, who, if they are able, switch on the lamp and waste current whilst the owner is away. Since the earlier troubles of accumulators (and some of the modern ones, too) are caused by the accumulators working loose inside their boxes and spilling quantities of the acid on the securing padding, this device is bound to be copied by other motor cyclists having electric light installations, and a simpler or more rigid attachment could scarcely be imagined.

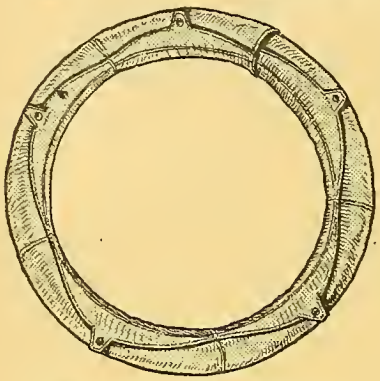


Location of accumulator on New Hudson belonging to Mr. Evans, works manager of Messrs. Brown and Barlow.

On the same machine was another device, evolved from the rider's desire that the engine should not show any external signs of oil, because, however careful one may be, some is almost certain to spray out from the compression release valve. On the New Hudson the compression release valve is housed inside a tube. At the end of this tube is a long copper tube, by which the oil is carried to the magneto chain drive case, and the oil blown out serves to lubricate the chain.

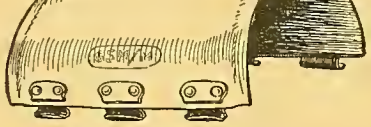
SOME DUNLOP NOVELTIES.

THE Dunlop Rubber Co., Ltd., have lately placed on the market several new motor cycle accessories. Probably the most novel of these is the cover bag, which we



Dunlop waterproof cover for spare outer covers.

illustrate. This is quite a useful accessory, tending as it does to preserve the spare outer cover considered essential by riders of passenger machines on



New Dunlop tyre gaiter.

tours of any length. It is made of American cloth, and the inner edge is stiffened by means of segments of wire, arranged at intervals. These spring into position when folded round the cover, and are secured by eyes fastening on to steel hooks. It will be noticed that each segment is provided with a tab allowing it to be pulled into position.

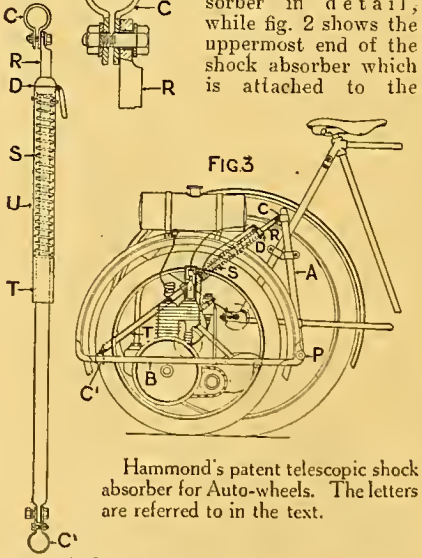
The Dunlop gaiter is another useful accessory, and should always be carried in the tool bag in case of a bad cut. It is fixed by being hooked into the rim. A gaiter of this kind will often allow a rider to return safely home even after his cover is damaged beyond repair.

The third accessory which we illustrate is an inner tube bag, a well-made article, in which three 65 mm. or 2½in. motor cycle tubes may be easily stored in perfect safety in the sidecar locker.

Tube bag sold by the Dunlop Co.

THE AUTO-WHEEL SHOCK ABSORBER.

PEOPLE have often noticed how Auto-wheel attachments bump right off the road when the surface is rough. When this happens a great deal of power is lost. The engine races, and when it comes down to the ground it naturally skids, causing an abnormal amount of tyre wear. The accompanying drawing shows how a device made by Mr. E. Hammond, Elmers End Road, Beckenham, should overcome this trouble. Fig. 1 shows the shock absorber in detail, while fig. 2 shows the uppermost end of the shock absorber which is attached to the



Hammond's patent telescopic shock absorber for Auto-wheels. The letters are referred to in the text.

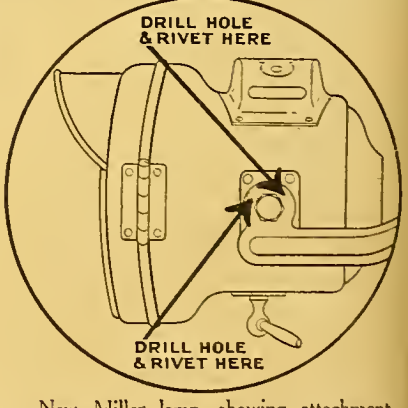
post of the Auto-wheel, and fig. 3 shows the device in use.

The clip C is attached at the upper end and secured to the post A of the Auto-wheel, and the clip C¹ has its lower end fixed to the frame or chassis B. The rod R is made a free sliding fit in the tubular extension T. A spiral spring S is placed on the rod R, the lower end of the spring engaging and compressing the top part of the tube T, and the upper end of the spring engaging with and compressing the lower side of the adjustable sliding collar D, which is capable of being fixed in any desired position by means of a small hand lever.

The shield U is for protecting the spring and sliding rod from dust and wet, but is not fitted to the shock absorber unless specially ordered, at a price of 2s extra. It is obviously necessary for the spring to be protected, consequently, in our opinion, the extra price should be added to the total cost, which is at present 7s. 6d. In using the device the tyre of the Auto-wheel should be pumped on the hard side. We certainly think the idea is good, and should be a boon to Auto-wheel users.

ADJUSTABLE HEAD LAMPS.

MESSRS. H. MILLER AND CO. send us an illustration showing how an adjustable lamp may be prevented from swivelling, and thus made to conform to the new lighting regulations. All that is necessary is to drill one or two small holes,



New Miller lamp, showing attachment to comply with the new non-swivelling regulations.

after the lamp is in position, through the girder bracket and the boss of the lamp, and insert small pegs which can be screwed or riveted to the bracket. This makes a much neater job than soldering. We have used a similar method on one of our own lamps for the last few months. Non-compliance with this regulation may lead to the confiscation not only of the lamp, but the whole machine, as well as a heavy fine.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Cracked Crank Case.

[?] The aluminium crank case of my machine has cracked at one of the frame lugs, and allows oil to escape when the engine is running. I am told the only thing I can do is to have a new crank case. Can you suggest any way of stopping this leakage?—S.H.

Your best plan will be to take the crank case to a firm of aluminium founders, and see if they can weld the crack. We should think this would be quite easy to do, but it is impossible to say without actually seeing the fracture.

Knocking on Hills.

[?] I have a 2½ h.p. 1915 single-cylinder lightweight. When new it would take full air, and go up almost any hill on top. Now, however, after having run 800 miles, it will not take full air, and is very much inclined to knock, and does so on almost any hill. Is this due to carbon deposit, and, if so, is not 800 miles a very short distance to go before getting carbonised? The ignition is fixed.—G.J.M.

The trouble may be due to a partially obstructed jet. It is quite possible that the engine requires to be cleaned of carbon deposit, but it ought to run at least 1,000 miles before this is necessary. We do not altogether agree with fixed ignition on an engine of this type. See that the tappet clearances are correct.

Pre-ignition.

[?] I have for some time been troubled with the curious behaviour of my two-stroke. If I travel all out for a brief period (about thirty-five to forty miles per hour) the engine will suddenly knock, and the machine will come to a standstill just as if the brakes were hard on. I may mention that when this knock occurs it is quite impossible to free the engine by the clutch or by the gear lever, but as soon as the machine has stopped I can at once insert the low gear and start off again for about an hour when this will again occur. A friend suggested overheating.—W.A.C.

You are obviously over-driving your machine. The trouble is overheating or pre-ignition, caused by an excess of carbon deposit or a plug which is not suitable, probably the latter. You ought to use a good single-point plug of first-class manufacture. Drive slower and use more oil.

Difficulty in Starting.

[?] Will you please give me some advice? I am a novice, and about six weeks ago I bought a 1913 5·6 h.p. single-cylinder free engine motor cycle, and at all times I have a terrible job to get the engine to start. I put the machine on the stand, inject a little petrol in the compression tap, and pedal hard. Sometimes the engine will start like that, but nine times out of ten it only explodes in the silencer. The only way I can start the engine is to run it on the road, and when it has started to fire suddenly to take the clutch out and retard the spark, but I find this dangerous; also the exhaust pipe and chamber get red-hot. If I open the air lever it has a tendency to stop the engine unless it is going fairly fast. I use a Senspray carburetter, and have fitted a new sparking plug, also a new compression tap. None of these seems to make any difference to the starting of the machine, and I am afraid to go for a ride for the fear of having to push the machine home.—C.S.

Advance the spark halfway, inject a little petrol (not too much), close the air, and open the throttle about a quarter or one-third, and the engine, if properly adjusted, should start quite easily. The sparking plug should be of the single point type, and the points should not be too close together; try a gap of just under 1 mm. It is quite natural for the engine not to take full air unless it is running fairly fast, but for the exhaust pipe and exhaust chamber to get red-hot is quite wrong, and seems to indicate that the timing of the spark is too late; always run with it as far advanced as possible. You might try new valve springs. Also make sure that the contact breaker is quite clean, and that the points do not separate more than ½ mm.

Annual Buyers' Guide
OF
THE MOTOR CYCLE
An Invaluable Work of Reference.
This year's Guide will appear in our issue of THURSDAY, Nov. 25th, and illustrations of 1916 Models will form a feature.

Misfiring.

[?] My 3½ h.p. single-cylinder machine has recently started missing fire when the ignition lever is fully advanced, but it goes all right when the lever is about one-third retarded. I have examined the platinum points, carbon brushes, plug, and valve timing, and find everything in order, while the compression is good. I have also cleaned out the carburetter. The platinum points break with the lever two-thirds advanced and the piston at the top of the firing stroke. The machine has gone perfectly up to just lately. I shall be obliged if you will kindly give me your advice.—P.G.

Are you sure that the magneto points separate properly when the spark is fully advanced? Possibly owing to wear, the points do not break adequately in this position. Watch the contact breaker carefully while some one turns the engine, and see the spark is advanced while you do this. If this point is correct try new valve springs.

The Effect of Explosion in Silencer.

[?] I shall be obliged if you can tell me the cause of the engine backfiring. It did so on starting the engine a few days ago. The explosion took place in the exhaust box and caused a fire, which did not, fortunately, do any damage, as it was put out by chemical extinguishers. The machine had only come back after being overhauled by the agents from whom I bought it second-hand. The machine is with a firm near here (Bandon). The firm seems to think that the cause of the accident—backfiring—was due to one of two causes: the exhaust valves leaking or the timing gear being set wrongly. I am anxious to know as soon as possible, so as to get the thing put right in the correct way.—F.N.A.

There is always a danger of fire in this way, especially if there is any petrol leaking from the carburetter, and if the carburetter is over the silencer. What happens is that when you attempt to start the engine the first charge is not fired, and is carried away into the silencer. The next charge, which is fired, causes an explosion in the silencer, and if any petrol has dropped on it a fire is caused. Of course, if the timing is incorrect and the inlet valve is opening at the wrong time you will get a backfire through the carburetter and cause a fire in this way.

Difficulty in Starting.

(1.) I have a 1915 2½ h.p. two-stroke machine, and I find great difficulty in starting. I have examined the carburetter and sparking plug, but cannot find any fault. If when running the machine I keep opening and shutting decompressor smartly it gives a loud explosion, and then starts away all right, and runs for about half a mile, and then suddenly ceases to fire, but as soon as I lift the decompressor it does the same as when starting. Sometimes it refuses to start unless I change the plug, but still the old plug seems to spark all right outside cylinder. (2.) I am troubled a great deal with four-stroking, and it is only when I have a load on or am going up an incline that it will two-stroke. I have fitted an 18 jet in my carburetter and adjusted the petrol level, and always drive with the air fully opened. I have been told I should get at least eighty miles per gallon of petrol, whereas I only get about sixty.—W.W.

(1.) The symptoms point to the fact that you are starting on too strong a mixture. Probably you flood the carburetter vigorously, and inject petrol as well. To render the mixture explosive you open and shut the decompressor, thereby admitting air which corrects the fault. Try a good single-point plug of first-class manufacture. (2.) The fault is a common one with two-strokes, and appears to be practically incurable. This may be exaggerated through the use of too large a jet, which might also cause the difficulty in starting. Yes, you should get about eighty miles to the gallon. Using a smaller jet would probably rectify this trouble also.

READER'S REPLY.

Winter Riding.

I have been a reader of your valuable paper for many years, and an all-weather cyclist for the last two years, and I noticed in *The Motor Cycle* for October 28th that your correspondent "H.C.S." asks for information *re* keeping enamel and plating bright, and yet reducing cleaning after a wet ride to a minimum. You advise the use of vaseline, but may I make a suggestion? I have ridden my 2¾ h.p. two-speed Royal Enfield in all weathers, and only use it on Saturday afternoons or Sundays, and yet I have no rust. The fact is that I have smeared all parts with raw linseed oil very freely, and although I cannot say it looks pleasing it is a splendid preservative. A coating twice a winter will keep out any amount of wet. I have often found many useful suggestions in *The Motor Cycle* from various motor cyclists, and I trust that my suggestion may prove of some value to some all-weather rider.—H.R.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"F.N.J." (Bucks). — Grado multi-pulley. Wear on belt and reliability.

"C.A.J." (York).—Philipson governor pulley for sidecar work. Also folding sidecars able to pass through a 3ft. doorway.

"T.A.B." (Newburn-on-Tyne).—6 h.p. Royal Enfield and sidecar. Reliability, hill-climbing, petrol consumption, and wear on tyres. Also £9 Lucas dynamo lighting set.

RECOMMENDED ROUTES.

BIRMINGHAM TO ACTON (CHESHIRE).—R.W.C.

Birmingham, Sutton Coldfield, Lichfield, Rugeley, Weston, Stone, Pipe Gate, Woore, Nantwich, Tarporley, Acton. Approximately 52 miles.

CHEAM TO BLETCHLEY.—W.F.J.

You cannot get from Cheam to Bletchley without passing through a considerable portion of the Metropolis, and you should time your journey so that you go through this portion in daylight. Cheam, past "The Plough" (Malden), Kingston, over Kingston Bridge, where turn right and follow the main road to Hounslow, then go through Heston, Norwood Green, Greenford, Greenford Green, Harrow-on-the-Hill, and thence to Watford. This part of the journey is clearly shown on the R.A.C. Official Map of Recommended Routes Round London, obtainable from these offices, price 1s. 8d. post free. Continue through St. Albans, Dunstable, Fenny Stratford to Bletchley.

FROM HOLYHEAD TO HONITON, HONITON TO BRAINTREE, AND BRAINTREE TO HOLYHEAD.—T.U.B.

Honiton, Ilminster, Ilchester, Bruton, Frome, Devizes, Marlborough, Newbury, Reading, Henley, High Wycombe, Watford, St. Albans, Hertford, Bishop's Stortford, Braintree. Braintree, St. Albans, Dunstable, Towcester, Daventry, Atherstone, Tamworth, Lichfield, Stone, Nantwich, Chester, Mold, Abergele, Holyhead.

HILL-CLIMBING IN CHILE.

The Valparaiso Motor Club recently held a hill-climb at which British machines—both four and two-stroke—did remarkably well, securing three first and two second places. Our pictures show—(Left) Harold Wilson (Junior Triumph) first in the 300 c.c. class and second in the 450 c.c. class. (Right) Edmund Maillard (3½ h.p. Triumph) has a tumble at speed, but it did not prevent him getting first place. He also made fastest time of the day, beating 7 h.p. twins.

THE AUTOMOBILE ENGINEER

Devoted to the theory and practice of AUTOMOBILE CONSTRUCTION.

Published MONTHLY (second Thursday in each month).

Price SIXPENCE NET.

ISSUED in the interests of engineers, designers, draughtsmen, works managers, heads of departments, and all others concerned with the designing and building of motor vehicles, and dealing fully with the technical and manufacturing side of the motor car, utility motor vehicle, and motor cycle industry.

SUBSCRIPTION RATES.

The Automobile Engineer can be supplied direct, if preferred, at the following rates:

Great Britain 9/-, Canada 7/6, other countries abroad 9/-, per annum.

Proprietors: Iliffe & Sons Ltd., 20, Tudor Street, London, E.C.

Northern Office: Century Buildings, Deansgate, Manchester.

NOVEMBER NUMBER Now Ready.

Principal Contents:

UNITY OF EFFORT (Leading Article).
GEAR-BOX DESIGN.
AMERICAN PORTS AND SEMI-RAW MATERIALS.
NOTES ON AUTOMOBILE CYLINDER CASTING.
WOOD WORKING MACHINES IN AEROPLANE MANUFACTURE.
SHOP METHODS AT THE DOUGLAS MOTOR CYCLE WORKS.
AEROPLANE ENGINES.
THE PEERLESS TRUCK.
THE TREND OF INVENTION.

Obtainable, by order, from any newsagent in the United Kingdom

New Edition (Revised) Now Ready.

TRACING TROUBLES

(Third Edition)

¶ A new Edition of this handy book for motor cyclists is now ready, thoroughly revised and brought up to date.

¶ Enlarged section dealing with Two-stroke motor cycles.

¶ New section dealing with electric lighting dynamos as applied to motor cycles.

Price **1/-** net. By Post, **1/2**

From Iliffe & Sons Ltd., 20, Tudor Street, London, E.C.

And leading booksellers and bookstalls.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed ——— & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

Abingdon.

DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade Labour Exchange, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.
